MEETINGS OF NEW YORK MILK PRODUCERS.

The meeting of Cobleskill Local Section No. 41, F. S. M. P. A., was held August 7. Officers chosen for the ensuing year are: President, Sothenese Lawyer; secretary and treasurer, Warner J. Walker.

W. J. W.

At the annual meeting of the Big Flats section of the F. S. M. P. A., J. E. Farr was elected president, H. M. Fox, secretary and treasurer, for the ensuing year, and Judson Goff delegate to the route union. Members expressed themselves in favor of maintaining and perfecting the organization, and were satisfied they had already derived much benefit from it.

H. M. FOX, Secretary.

A few of the members of the Wysox local F. S. M. P. A. met at Grange Hall August 5. Louis Piollet was chosen as delegate to the route union meeting at Sayre, August 13, with Robert Brown as alternate. Collection of dues and election of officers was postponed as there were so few out. Though not instructed, our delegate will oppose the reëlection of the old executive committee. Most of our members have no confidence in them, and will not work under them. E. G. OWEN, Secretary.

The Deposit section of the F. S. M. P. A. held its annual meeting August 6, and elected the following officers: President, E. S. Smith; secretary, S. C. Sliter; treasurer, E. C. Briggs. Executive committee: D. W. Axtell, D. C. Freeman, S. H. Axtell. As delegates to the route union, S. C. Sliter and D. W. Axtell. The meeting was not largely attended, but those present were quite enthusiastic over the plan of co-operative creameries. A committee was appointed to investigate the situation and report. REPORTER.

The annual meeting of the Holland Patent Local Section, F. S. M. P. A., was called to order by President F. H. Thomson, who made a fine address on opening. A large number were present and enthusiasm was shown throughout, many discussing the milk problem, and everyone agreed to stand by the officers of the F. S. M. P. A. The farmers in this locality stand shoulder to shoulder on this question and will fight to the end. The result of election of officers was as follows: President, F. H. Thomson; secretary, Frank Fear; treasurer, S. F. Kane. Route union delegate, F. H. Thomson. Executive committee: F. H. Thomson, Frank Fear, C. E. Alvord, George Chassell, A. Holland. Finance committee: C. F. Hamlin, George Hutchinson, J. B. Fuller.

FRANK FEAR, Secretary.

The annual meeting of Marshall Station Union, F. S. M. P. A., met at the residence of R. W. Evans, August 7. A full attendance was secured. A more earnest or better attended meeting has not been witnessed since our organization. If the milk producers of all local unions could but be convinced of the necessity of thorough organization and a strong, united effort on our part to support the officers of the central association, they would be more successful. Milk producers through the central association are not fighting for an advance over the yearly average of 1900 of 2.084 cents per quart. Two and a half cents as a yearly average to the producer net, need not of necessity advance the price of milk to the consumer in New York. This is all the central association is contending for. This small advance would mean some profit and not loss to the producer. After the election of R. W. Evans for president and J. E. Head as secretary and treasurer for the coming year the following resolutions were passed: That the patrons of Marshall Station, as members of the F. S. M. P. A., appoint a committee of one to confer with all producers not present at this meeting, and ask them to join in taking care of, or withholding milk should the central association so order. That a committee of two be appointed to confer with the patrons of the milk station at Green's Crossing, to ask them to join in opening the cheese factory at Tompkin's Crossing, or otherwise to take care of the milk, and not sell the same to be shipped to New York dealers, should we be asked by the central association to withhold the same. In view of the fact that all feed stuffs the coming Winter will doubtless be from $20 to $25 per ton, the central association was asked to fix a price for milk that shall not be less than 2½ cents per quart as a yearly average. The resolutions were unanimously adopted. J. E. Head was chosen as a delegate to the route union to be held at Binghamton, August 13. J. E. HEAD, Secretary.

Country Roads.
Memory Training.
My Handkerchief Garden.
How to Plant a Place.
Accidents and Emergencies.

THE RURAL NEW YORKER,
409 Pearl St., New York.

MARKET NOTES

BEANS.—For a long time trade in beans was dull, and with no changes worthy of note; but light receipts and reports of poor crops have caused a big advance. Choice marrows reached the $3 mark, and have remained there for several days. Some holders are asking more than the quoted prices, but buyers do not think that the conditions warrant any further advance. The supply of imported beans is also very limited.

COTTON.—The report for July shows a seven per cent decrease from the preceding month. Drought is responsible for a large share of this, but excessive rain in the eastern portion of the belt damaged the stand and hindered necessary cultivation to such an extent that in some cases weeds took entire possession and fields were abandoned. These unfavorable conditions have caused a slight rise in price, but speculation is light, and the present trend of the Liverpool market tends to check any further advance. Spot prices here are: Middling uplands, eight cents, a drop of 1 13-16 cent from last year, and Middling Gulf 8¼ cents.

FRUIT NOTES.—The early apple is the most active item on the list. Hand-picked Red Astrachans and Nyack Pippins have brought as high as $3 to $3.50 per barrel. These extreme figures, however, do not apply to anything except choice fruit. Windfalls are bringing a surprising price, 75 cents to $1.25, but this means sorted windfalls. There is no use in sending the worthless culls here, as the market is overstocked with these, both of apples and pears. Southern grapes more plentiful but do not attract much attention, as most of them are of inferior quality. A few Maryland and Delaware Bartlett pears are arriving, but they are not up to standard and sell slowly. Watermelons are scarce, particularly large sizes, which would bring a premium over present quotations. There are plenty of muskmelons, such as they are, and, as usual, there is a wide range in prices. W. W. H.

LONG ISLAND NOTES.

THE NORTH SIDE of the Island is very hilly. After climbing a few of these hills one is likely to feel like calling them mountains, as some are 200 feet or more above sea level. The railroad runs through deep cuts of clean sand and white gravel. There are several harbors on the north shore, the best of which is Port Jefferson, where shipbuilding in the form of yachts and schooners is carried on. Along the shore in this vicinity are high bluffs. At one place a person can stand on Mt. Misery and see Conscience Bay on one side and Mt. Sinai on the other. Mt. Misery is well named, much of it being covered with a dense growth of small trees, bushes, wild grapevines, poison ivy, and a variety of tough briers which have a habit of growing like croquet wickets all over the ground. Wherever these cliffs are bare of vegetation they are gradually breaking away, owing to the action of storms, and the sea takes possession. From Port Jefferson to Wading River, a few small villages and many well-kept farms are seen, but much of the country is a wilderness covered with scrub, and for miles the road on each side is lined with huckleberry bushes. In some places I found the berries so plentiful that they could be picked by the handful.

CAULIFLOWER.—Going south to Riverhead a new industry is seen, namely cauliflower growing on a large scale. The plants for the early crop are already set and growing finely, while other fields are just being set. The plants are grown thickly in small beds, and, when the leaves are four or five inches long, are taken up and transplanted in the field in hills about 3x2½ feet apart. In taking up the plants an effort is made to leave a little earth on the roots. The transplanting is usually done when the ground is wet. One man takes the basket of plants and drops each one in the proper place in the row, much the same as in dropping potatoes. Another man follows to do the setting. He has an iron spike to which is fastened a short wooden handle. He jabs this spike in the ground, puts in the plant, gives the soil two or three whacks to pack it down, and goes on to the next one. I timed one man who seemed to be something of an expert at this work, and found that he was setting about 20 a minute.

ASPARAGUS was at one time a standard crop in this section, and large quantities were shipped fresh and canned, but the rust has made such havoc that only now and then a field is seen. Some growers have concluded that the crop is not worth the labor needed to handle it, since the rust has come. This is doubtless true unless prices are high, but this year asparagus has sold so well that, even with the comparatively light yield, it has paid. I stopped at Mattituck to look at the fields where last year the New York State Experiment Station made a test with Bordeaux Mixture on asparagus. Their work was described in THE R. N.-Y. last Fall, and the results on the field were very plain then, the rows that were thoroughly coppered being green and thrifty, while those that were left unsprayed were badly rusted. At the time of my visit, August 5, no spraying had been done, as the rust had not made its appearance. As asparagus rows are so wide apart, some growers follow the custom of putting a late crop, like beans, in between, there being plenty of room to run a cultivator on each side of this extra row.

THE NORTHERN PENINSULA.—From Riverhead to Orient is one of the finest farming sections I have ever seen. A stranger looking at a small map of Long Island might think that the little strip on the northeastern corner, about 20 miles long and averaging less than three miles wide, could not amount to much, but he would soon change his mind after seeing the corn and potato fields there this year. Of course, all farms are not kept up to this high degree of fertility, and the crops show this neglect at once. Probably the lack of feeding and care of land is seen more quickly in a section like this, of sea formation, underlaid with sand and gravel, than on the plains and among the hills and river valleys, where vegetation has had a foothold for a much longer time. A most interesting struggle is constantly going on between the sea and these exposed portions of land. Vegetation is at work trying to reclaim these sands from the ocean. It crowds down to the water's edge, there being certain plants which thrive and throw out an extensive root system in clean white sand, which, to all appearances, does not contain a trace of vegetable matter. In the battle their methods and those of the sea are entirely different. They work slowly, and for years make gains, when in some furious storm the ocean washes them away with all traces of their work. Yet, vegetation never gives up, and other plants at once continue this work. Portions of land like this section and Cape Cod are battle grounds worthy of being studied.

CORN AND POTATOES.—I have not seen any better corn this season than in many of the fields on the main road between Riverhead and Southold. It is tall and leafy, dark green and earing heavily. This light land, when well fertilized, is ideal corn ground. While occasionally a man on being questioned would say that the potato yield was slim, many more were found who had a heavy crop, perhaps not record-breaking yields, but large for this season and made still larger by the present high prices. Part of the early crop is already dug and sold. One man who had contracted 160 bushels at 50 cents was feeling blue, as his nighbors were now getting $1. I found another man who had sold $280 worth from 1½ acre, the price being 75 cents and $1 a bushel, and he was then sowing turnip seed on the same field. "Yes," he said, "these prices are a boom for potato growers around here, and will put some of them on their pins. I am also an auctioneer, and this prosperity will take away some jobs from me, but," he remarked, philosophically, "I always hate to sell a man out unless he really wants to leave for some other reason than bad luck."

LARGE FARM GARDENS.—At Orient is the farm of George W. Hallock & Son, which was described in THE R. N.-Y. a few years ago. They have about 85 acres under intense cultivation, raising corn, potatoes, onions, carrots and other vegetables. Carrots are sown between the rows of onions, and the latter are now being harvested. After being pulled and left in rows to dry, they are taken in wooden crates to buildings and either stored or shipped. It is needless to say that tillage and fertilization are carried on to best advantage in these gardens. The Messrs. Hallock own a steamer and have ample dockage and storage facilities on the side of their farm adjoining the bay. The produce is marketed in New York, and also Connecticut and Massachusetts points. About 45 men are employed on the farm at present.

W. W. H.

BUSINESS BITS.

THE Imperial pulverizer manufactured by E. S. Peterson, Kent, O., has proved to be an excellent implement for many of our readers. It pulverizes and rolls the land in one operation. Address as above.

THE Swan roofing material is not only used for roofing but for the sides of buildings as well. It is very popular with poultrymen for both roofing and lining henhouses. Many will testify that after 10 years of service their roof is apparently as good as ever. Write A. F. Swan Co., 114 Nassau St., New York City, for particulars.

THERE isn't a shadow of a doubt that a manure spreader will pay for itself in a short space of time on any farm where stock is kept. Not only does it save labor, but it spreads the manure more evenly than it can possibly be done by hand. The improved Kemp manure spreader breaks up lumpy, caked, or strawy manure and spreads it in any desired quantity per acre. It also spreads lime, salt, ashes, etc. Send for new illustrated catalogue which describes improvements and tells "How to Grow Big Crops." Address Kemp & Burpee Mfg. Co., Box 38, Syracuse, N. Y.

PAN-AMERICAN EXPOSITION NOTES.

Some of the Agricultural Exhibits.

PART I.

The agricultural exhibits are mainly found in the Agriculture Building, which is separate and distinct from all others, and is located between the Government Building and the Electric Tower, in a very beautiful situation. The building is not so large as it should have been, because there are a number of exhibits of this nature that are very much crowded, and some have been almost crowded out. The Agriculture Department is under the supervision of F. A. Converse, who is well known to the readers of THE R. N.-Y.; he has conducted it ably from the first, and seems to give general satisfaction.

NEW YORK.—This State occupies one of the largest places in the building. The exhibit is principally of cereals, field and garden seeds, nuts, manufactured products, all arranged in the same oak cases in which the agriculture exhibit was made at the Columbian Exposition. There are also samples of wheat and other grains in the straw.

CORNELL UNIVERSITY EXPERIMENT STATION is making a continuous show of fresh vegetables and forage crops. For instance, there were 18 varieties of beets and 19 varieties of onions all in a fresh condition, just as they were taken from the gardens, and arranged in a very unique way to show just how each variety appears. There is an exhibit of tobacco growing in pots, and also one of ginseng in the same condition; the latter being one of the special crops about which we hear so much in the papers of late, and it is well worthy of notice by farmers who are properly situated for growing it. The Division of Botany of the University of the State of New York has a very interesting exhibit of mushrooms, comprising about 50 varieties. These are in a preserved condition, pasted on large cards, and accurately named with both their popular and scientific names. On the whole, the exhibit from the State of New York is very creditable, although not so attractive and ornate in style as some of the others.

NEW JERSEY has an exhibit which is rather small, so far as the space occupied is concerned, but it is very representative, well arranged and much to the credit of the State. Its principal feature seems to me to be educational. There is an industrial map which shows all of the leading industries of New Jersey, giving the territory embraced by the growth of each of the leading crops; as, for instance, the locality where the sweet potato is one of the leading crops is distinctly marked. The same is true of the various fruit crops, the extensive floral industries, and the oyster regions in the coast waters. By the way, it may be a surprise to many to know that in central southern New Jersey there are some of the best corn crops grown of any in the whole United States. The size of the ears and the output per acre of the fields is fully equal to the best in Illinois, or any other of the leading corn-growing States, although the areas are comparatively small. There is being made a continuous exhibit of fresh vegetables and farm crops direct from the farms in different parts of the State, which show to the public just what is being grown. This is indeed a very pleasing feature, as well as a permanent one of this exhibit. There is also an educational section in which the beneficial and injurious insects and other such things are shown, especially with reference to the education of farmers' children. Franklin Dye, who is the leading spirit of the New Jersey agriculture exhibit, is doing the best he can with the small appropriation which has been allotted to him, and and no one need feel ashamed of what New Jersey is doing in this direction. H. E. VAN DEMAN.

A Country Lass,

Health in her beaming eyes, health in her glowing cheek, health in her merry laugh. Yet country air and country hours can't save her from the common experience of women—an experience which dulls the eye, pales the cheek, and turns the laugh to a sigh. Womanly ills come to almost all. But for these ills there is help and healing in Dr. Pierce's Favorite Prescription. It regulates the periods, stops unhealthy drains, cures inflammation, ulceration and female weakness. It makes weak women strong, sick women well.

"Miss Ella Sapp, of Jamestown, Guilford Co., N. C., writes: "I had suffered three years or more at monthly periods. It seemed as though I would die with pain in my back and stomach. I could not stand without fainting; had given up all hope of ever being cured, when one of my friends insisted upon my trying Dr. Pierce's Favorite Prescription. With but little faith I tried it, and before I had taken half a bottle I felt better—had better appetite and slept better. Now I am happy to say I am entirely cured, and all done in two months' time, when all other medicines had failed to do any good at all."

Biliousness is cured by the use of Dr. Pierce's Pleasant Pellets.

Live Stock and Dairy

A SEPARATOR ON WHEELS.

The papers often contain an account of some man in the West who has fitted a separator on a wagon and goes from farm to farm separating milk as desired—hauling the cream to a creamery. Is it probable that these reports are true? It is easy to see how such a thing would simplify the cream-gathering business, but we do not see just how a separator could be worked to advantage under such conditions.

We do not know here of the portable skimming station to which you make reference. This is not new, however, as you know. There have been a number of attempts of the kind before. Beard Bros., of Decorah, Iowa, were about the first, we think, to attempt it. They put out several wagons, using one of our dairy steam turbine machines with a small boiler, and one of the Beards took out a patent on an adjustable balancing device for the separator, and also on the combination outfit thus employed. They sent these wagons about from farm to farm, and considered the scheme a success. Soon after instituting it, however, they were forced into liquidation, and their business went to pieces. This was seven or eight years ago we believe. As to the practicability of the project, it is all right in theory, but we have never looked upon it as practical, though it is only fair to say that we have not given it serious consideration. It is absolutely necessary, as you may know, that a separator stands at perfect level when in use. This is difficult to arrange quickly with an outfit of this kind, and we think there would be a great deal of wear on a machine carted about in such a manner, as well as a material impairment of the thoroughness of separation under the conditions of use. THE DE LAVAL SEPARATOR CO.

We do not know of a single case where this has ever been tried where it proved satisfactory. For several years past we have had occasional inquiries from parties who purposed trying this plan, but we do not know of a single one that has operated it. In the first place, the separator would have to be leveled up every time it was used, as in operation the separator must stand perfectly level; furthermore, the different patrons' milk would all be getting cold while the separator was being taken from patron to patron, and good close skimming would thus be well nigh impossible. The time required in going from place to place and leveling up the machine and getting it in shape to operate would be considerable; in fact, as much, if not more time, would be consumed in going from farm to farm as would be required in the process of separation. Different adjustments of the cream screw might also be necessary among different herds of cattle, and when such different adjustments of the machine were advantageous or desirable you will at once readily see how it would still further complicate matters. Another great disadvantage would be the impossibility of providing a good firm foundation for the separator when mounted on a spring wagon, unless of a special construction, so that the platform of the same could be shored up in some way. A separator, in order to do good work at the high speed necessary, must set on a good solid foundation; otherwise it is impossible to produce the best results with it. Again, carting a machine like a cream separator constantly about over roads more or less rough would necessarily disturb the adjustment. We do not believe it would be possible to keep any cream separator that was ever built in good adjustment under those conditions. Other objectionable features might be named, but we think the above are enough, and more than enough, to deter anyone from wasting his money on an investment of that kind. P. M. SHARPLES.

We have heard from several different persons in regard to an attempt to carry a separator around in a wagon from place to place, separate the cream at farmers' houses, and then carry the cream on to the creamery. We know of one man to whom we sold a separator who attempted this plan, but so far we do not know of its having been a success. It looks practical, and ought to be feasible, except that it is necessary to have the separator set level, and this is not always easy to do, because of its being impossible to get the wagon always level, but if the operator will exercise some ingenuity, so as to enable him to level his separator quickly at each place, we cannot see why it is not entirely practical, using a gasoline engine for the purpose. Our judgment is that it would be much more satisfactory for each farmer to have his own separator and separate the milk fresh from the cows. The conditions of separation would then be much more satisfactory, and the farmer would have his skim-milk warm and ready to feed to his calves and hogs just at the time that he desired it most. The only feature that we see to recommend the arrangement is to save the farmer the expense of purchasing a separator, but we consider this would be more than offset by the advantage of having a separator to separate the milk fresh from the cows, and have the skim-milk ready for feeding at just the proper time.

VERMONT FARM MACHINE CO.

Fowls With a Cold.

What shall I do for a disease which has shown itself for the first time this Summer among my poultry? It affects both this season's chicks and the yearlings. A sudden and very pronounced swelling around one or both eyes, and within 12 hours a sudden drooping and death. As there is no other pronounced symptoms except the swelling at the eyes, no discharge from nostrils, offensive odor, etc., and as a generally healthy condition, with good appetite, seems to continue until the time of sudden drooping, it does not appear to be roup. The poultry have a thoroughly clean and roomy house, ample dust baths and grit, and the range of the whole farm of 70 acres, including orchard, and meadow with running water. S. W.

West Chester, Pa.

The symptoms of fowls, as described, would indicate, apparently, a cold which is liable to develop into roup. This Summer has been especially trying for poultry, owing to sudden changes in temperature, extremes of heat and cold, dry and wet. These birds are probably sufferers from overheated quarters the first half and underheated ones the latter half of the night. I would advise dissolving an ounce of chlorate of potash in one quart of warm water, and give them a teaspoonful twice a day. Examine their nostrils and squeeze them to see if any liquid matter comes out. If so, inject a few drops of kerosene and sweet oil mixed in equal proportions. F. E. W.

Eggs in October.

I do not know of any reliable method of forcing hens so that they will lay in October. Some hens, fed a fairly nitrogenous ration containing considerable old-process linseed meal, finished moulting earlier than others having a ration containing considerable starchy and fatty foods. After hens have begun to moult I should feed a liberal and rather narrow ration containing animal food and some nitrogenous grain foods mixed with the ordinary grains, and feed this ration also for a few weeks before moulting. Perhaps it may be found of advantage to feed a lighter and less stimulating ration until laying is discontinued. With Leghorns it has always been easier to secure the October eggs from early pullets, the hens very seldom laying until late in November, probably because they continue laying late in Summer. On the other hand, Cochin hens, which are hardly to be considered with the Leghorns for general laying, have often laid well during October, beginning even in September and continuing through the Winter. I have had hens of Game and Asiatic blood lay well in the Fall. So far as my personal experience with old hens goes I am inclined to the opinion that best results can be secured from the American, or possibly some of the Asiatic breeds in October eggs, but I would rather depend on Leghorn pullets. I believe that early moulting, an essential with hens which are to lay in the Fall, is largely an individual characteristic, and that improvement can be made by selection in breeding. W. P. WHEELER.

Food for Peacocks.

What is the proper food for peacocks, young and old; also care required?

Marquette, Mich. H. A. B.

From what I have learned from breeders of peacocks the food and care should be much the same as for young turkeys. They are even greater wanderers than turkeys, and must have plenty of range to do well, and they will gather their own food to a great extent. J. E. S.

Mixed Crops in the Silo.

Is it a wise plan to mix Soy beans, cow peas or similar crops with the corn when filling the silo? In theory this ought to give a better quality of silage, but is it practical?

In my opinion it would not be wise to try to balance the silage ration by mixing cow peas and beans with the corn silage in the silo. My experience with trying to silo highly nitrogenous plants has been far from satisfactory. Then, too, usually the beans and peas are not at the proper stage for silaging when the corn is in the best condition. We have tried not only cow peas and Soy beans, but Canada field peas. The latter give better results than the former, but all are far from satisfactory. Corn is the great silage plant and ever must be—easily raised, seed costing but little, yield large and the crop serves to clean the land when properly tilled. Far better silo corn alone and balance up the ration with cotton-seed meal, bran or other nitrogenous concentrated foods. Then, too, a ton of cotton-seed meal or bran can be purchased nearly as cheaply as can a like amount of nitrogenous foods be raised, and since these meals and brans are concentrated and quickly digestible, they are much to be preferred to coarse or unconcentrated nitrogenous forage plants. So many have practiced balancing the silage ration by mixing carbonaceous and nitrogenous plants together, and have abandoned this practice, that it seems hardly worth while to experiment along this line even in a small way. [Prof.] I. P. ROBERTS.

"Is Crimson clover hay a safe feed for live stock, especially horses?" Yes—the editor of THE R. N.-Y. to the contrary notwithstanding. I have been feeding Crimson clover hay to five horses three times a day for 10 months, not only "without injury"—but with the most satisfactory results. I prefer it to Timothy—or anything else—for horses.

DAIRY AND FARM NOTES.

Feeding and Working Problems.

VALUE OF ALFALFA.—I promised to give the result of a change from oats and peas to Alfalfa. The grain feed was kept up until the change was made to Alfalfa. I was somewhat in doubt which would be the better test, to continue the grain or take it off. The conclusion was finally reached that a more satisfactory test for the Alfalfa would be to take it away entirely. We have been feeding nine days. The milk from this dairy has decreased during this period about 50 pounds a day, or from 875 to 825 pounds. The shrinkage has nearly all taken place during the last three days, following 48 hours of heavy rain, which accounts at least for a part of the shrinkage. The dairy was eating during the oat-and-pea period about $1.50 per day. As closely as I can estimate, the Alfalfa has saved about 50 cents a day, a net saving, or really a net gain, of seven per cent on the sales from this dairy each day; certainly worth considering. I am not withdrawing any claims made for oats and peas, however. A small piece containing 1.3 acre fed 40 cows twice a day all they would eat clean, medium-sized Holsteins, hearty eaters, for 17 days, and enough cut which was too ripe to feed three days longer. No special effort was made to produce a large crop. It was better than an average growth. Is there any reason why cows should grub in a barren pasture when such small areas will produce so much feed?

COST OF SOILING.—I have kept tab on the men when they were cutting and feeding, and an average of one hour each day for two men and a team was sufficient. I met a farmer to-day who asked some questions about soiling. Said he: "What an amount of labor it must require to feed cows every day. I don't see how you get time to do anything else." Yet he had just come from the woods, having spent a half day with two men and a team getting two small logs to market, worth $1.50. It is just such efforts at false economy among dairymen that keep down the net earnings of their dairies. But after all said and done, we find it much easier to judge than to be judged. This same man no doubt considered it the act of a lunatic to pay men $1 a day and board to plow, sow, cut and feed green watery stuff to cows, and then see them lie down and chew their cuds, when they could as well be busily engaged cutting their own fodder.

FEEDING LAND.—The early oat and pea land has been plowed, fitted nicely and sown to flat turnips. I shall harvest them in plots and leave plots to go through the Winter to be plowed under in the Spring. I am much interested to know how far they are able to assimilate and digest insoluble phosphoric acid. Some nice plant-feeding experiments carried on by Dr. Jordan seemed to show that turnips could use insoluble phosphoric acid. We shall closely observe the results. Every crop points in the same direction on all of our lands, lack of phosphoric acid. We seem to have plenty of potash available, and in proportion to the mineral elements, plenty of nitrogen. I find as much necessity for a well-balanced plant food as for a balanced animal food. Excessive growth, without available mineral matter to back it up by way of stiff straw and full grain is very unsatisfactory.

MANURING.—I wish it was possible to strike the proper gait in farm management, and find changes unnecessary. I wonder whether others are thus affected. I have been watching very closely for three years the application of manures to corn land. For many years Winter surface application to unplowed sod gave much the better result. Three years ago and two years ago we found surface application to Fall-plowed lands, either turf or stubble, gave equally as much corn. I am satisfied now that the only reason for the changed results was the manner of working the manure into the soil. Formerly we had no efficient means of thorough incorporation with six inches of surface soil. Since using the heavy 20-inch disk harrows with three or four horses attached we have been able to mix the manure, and so results have changed, and we have no fear of Fall plowing for corn. For all other crops in northern latitudes Fall plowing has come to be accepted, and on our farms with above results, we would adopt it for all crops if it is possible to get it done. This season's corn growth now brings out another observation, and an experience which, if borne out in seasons with less rainfall than the present, will facilitate farm operations on "union home farms" very much indeed. Not all of the corn ground received manure, and the portions which are scattered through the whole field do not at present writing show the marked contrast that one would expect. A fertilizer made of 500 pounds cotton-seed meal and 1,500 pounds 14 per cent dissolved rock used at the rate of 300 pounds to the acre was used over an entire 20 acres. These results would seem to justify the application of the manure this Winter to young clover meadows as a topdressing, and the use of commercial manure on sod for corn. I fully understand that these somewhat varying results from year to year are due in great measure to the peculiarity of the seasons. This season, with an abundance of rain coming always when needed, the effect of surface application during the Winter to grass lands has been something marvelous; in 1899 and 1900 these same applications were not so effective.

JUDGMENT NEEDED.—Good judgment is required not to be guided purely by conditions in sight. I must confess that I am not strongminded enough not to be more or less influenced by things in sight, even though it is plain that local or seasonable conditions have been to a great degree responsible. The driver on a binder affects every part of the machine from his seat. So it is with agriculture; he can most effectively control the levers who can foresee and forestall; who deals with principles, who can analyze his soil through the laboratory of plant growth. He will Americanize his conditions; that is, adapt himself to his environments. We need ingenuity, mechanical constructive ability in our business; an ability to make a good joint, either square or mitered.

NEW YORK'S NEEDS.—The high or rather comparatively high prices of grains should stimulate an increased growth of grain on our eastern farms, and pay less tribute to our western cousins. I have just returned from a brief trip through central New York, and I must confess that we need more hustle and business effort among our farmers. So many fields are unproductive through default—a lack of systematic effort. I can pardon a man who has method in his madness; who finds it quite beyond his ability, financial or otherwise, to cover the whole farm with good work, and thereby takes a small plot only, and makes it blossom, permitting the remainder to grow to forest, or better still to go to sheep. But this system which has no stem or gudgeon, is wholly unjustifiable, and is the cause of so much criticism from our western friends. I was somewhat amused last Winter in Wisconsin when a large German farmer, after learning that I was from New York, inquired in all sincerity and honesty whether "der farms in der East vas all abandoned." He had evidently not traveled east. It is my candid opinion from a brief four weeks' observation that the western farmer has more hustle, more get-there than the dairyman of the East; a greater inherent agricultural adaptability. The farm influence is a greater comparative force than here both from an industrial and economic standpoint, and also a personal influence, which our varied eastern life has upon the youth, stimulating their city ambitions, which seem gilded with a perforated fringe of dazzling deception. Study agriculture, young man, and let us raise the agriculture of the East high above its present altitude. There is nothing so valuable in a man as local pride, town, State and National, each in its respective place, to fit him for a high place as a man and a citizen.

H. E. COOK.

Dry Country Feeding Notes.

They have had dry times in Kansas this season. The problem now, after the late rains have come, is to secure all possible roughage for Winter feeding. Prof. Cottrell, of the experiment station at Manhattan, is prompt with suggestions for farmers. In a recent bulletin we find the following hints:

Rape sown as late as September 1 will furnish pasture for hogs. Sow Dwarf Essex rape, five pounds per acre broadcast, or three pounds per acre drilled. It will do to feed in six weeks after seeding. An acre will pasture 10 to 20 hogs, and as seed costs only 10 to 15 cents per pound the cost is light. Rape is a fair pasture for cattle, but some dry feed must be given with it to prevent scouring. It takes a heavy frost to kill rape, so that it furnishes late pasture, and Kansas farmers should sow a large acreage to this crop. Turnips should also be sown largely, as the seed is cheap, and if a crop is secured the turnips will save a great deal of other feed needed for the cattle, young stock and hogs. We have not had success with late-sown millet, but if the Fall should be damp and cool, millet would make a fair crop. Wheat, oats and rye will furnish a large amount of pasture if the season is favorable, and while these crops are in good condition cattle will do well on them without any other food than straw. A farmer pastured his dairy cows on oats and sold during the Fall $7 worth of milk for each acre of oats pastured, the cows having no other feed.

It is too early to decide what will be the cheapest combination of feeds for Winter. The shortage will be in roughness. There is enough straw in Kansas to supply roughness for every animal in the State, and with many stockmen straw will be the feed to use. Farmers usually feed them 20 to 30 pounds of hay or fodder a head per day to stock cattle. Very much less may be fed if a proper grain ration is used. In 1888, a milkman in Manhattan wintered his entire herd of dairy cows without a pound of roughness, and he sold milk all Winter. The cows were fed all the grain they wanted, and in the Spring were strong, but they looked gaunt and rough. It always pays to feed a little roughness. The writer has brought cattle through the Winter in good condition on three to five pounds of hay per head a day, feeding grain. Bran or wheat will take the place of nearly all the roughness and can be mixed with cottonseed, gluten, germ oil or linseed meals, oats, corn or Kaffir corn, whichever is cheapest, and make a good ration at a reasonable cost. Wheat is worth about as much pound for pound as corn, and middlings are worth more as a hog feed. Fattening hogs fed all the Alfalfa or clover hay they will eat will fatten on much less grain than without hay. Sorghum hay is good for hogs. A few Winters ago some farmers in northwestern Kansas carried their stock hogs through the Winter on Alfalfa hay alone. Stock hogs fed twice daily all the Alfalfa, clover or sorghum hay they will eat will require much less than the usual amount of grain. Hogs should be fed sufficient rough feed so that they will need to eat the leaves only.

SORGHUM, Kaffir corn, cow peas and Alfalfa make safe pasture after cattle become accustomed to them, but great care must be used in starting stock, on such pastures. At the College we fill the cattle with straw or hay in the morning and then turn them on the sorghum or other green crops only 15 minutes the first day, the next day 30 minutes, and then increase the time 15 minutes each day until we reach an hour and a half, when it is safe to let them stay on all the time and not give them other feed. Cattle turned on such pastures at first, if hungry, will often eat a few mouthfuls and die in a few minutes or hours, says the Kansas Bulletin.

Humorous.

'Tis better in your haste to state
All men are liars, than
To pick out one and designate
That fellow as the man.
—Catholic Standard and Times.

MISS ALMA: "When did you becon acquainted with your wife, doctor Doctor: "After the wedding."—Heit Welt.

"WHAT were the poor fellow's words at his death?" "He didn't any. His wife was at his bedsid Norristown Herald.

EMPLOYER: "And how long we u in your last place, my good man?" James (just out of Sing Sing): "Ten years, sir, and I never had a single evening out."—Troy Times.

DUSNAP: "I see you call your naphtha launch after your wife." Bertwhistle (working over launch engine, perspiringly): "Yes; because whenever I want to go anywhere with it, it takes so long before it gets ready to start!"

NEW BOARDER (gently): "Hasn't this butter rather—er—a peculiar taste, Mrs. Slimdiet?" Mrs. Slimdiet: "That? That's roll butter, sir." New Boarder: "Yes—er—I suppose so; but where have they been rolling it?"—New York Weekly.

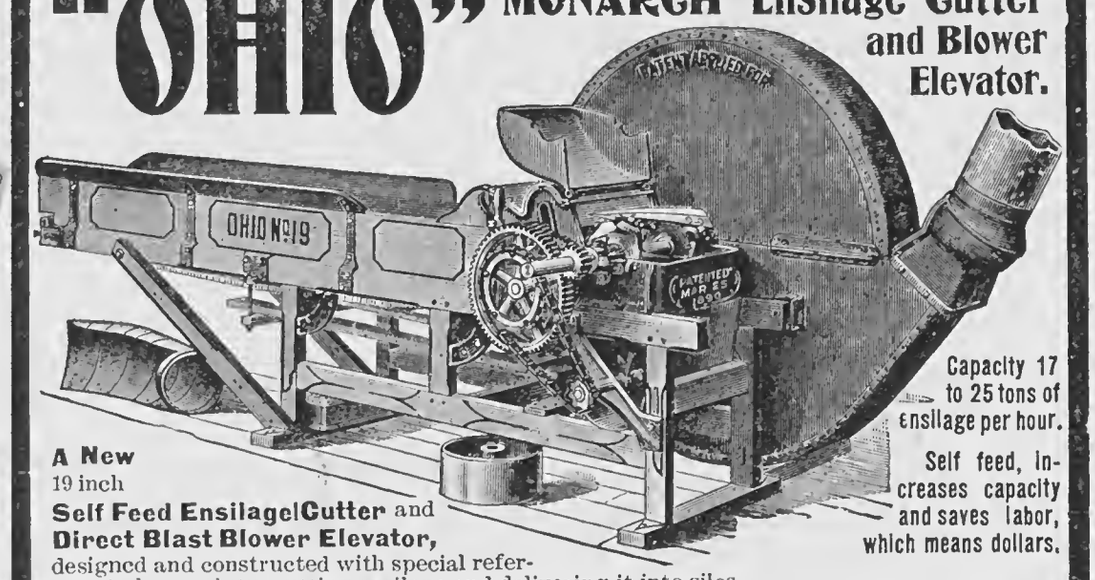
JOHNNY: "Look at the elephant moving his great big fins, mamma!" Mamma: "Those are his ears, dear. What use has an elephant for fins?" Johnny: "Huh! I guess he can use 'em when his head swims, can't he?"—Chicago Tribune.

"Is the ground around here very fertile?" asked the visitor. "Well," answered Farmer Corntossel, "us reg'lar agriculturists can't seem to do much with it; but some o' those real estate companies has managed to raise two or three crops o' building lots off'n it."—Tit-Bits.

"WHAT puzzling questions some of our readers ask!" growled the able editor of an agricultural paper. "Here is a city man, lately removed to the country, who wants to know how long cows should be milked!" "Aw, that's easy!" returned the office boy. "Tell him, just the same as short cows."—Puck.

Cornell University Library 2801

"OHIO" MONARCH Ensilage Cutter and Blower Elevator.



Capacity 17 to 25 tons of ensilage per hour.

A New 19 inch Self Feed EnsilageCutter and Direct Blast Blower Elevator, designed and constructed with special reference to heavy duty, cutting ensilage and delivering it into silos.

Self feed, increases capacity and saves labor, which means dollars.

THE CUTTER is larger, stronger and has greater capacity than machines formerly made for this work. The knife shaft is heavier and the shaft bearings are longer and stronger. The knife cylinder is larger diameter, which better enables the cut ensilage to clear the cylinder.

BLOWER ELEVATOR. A large capacity, properly and substantially constructed steel fan case with agitator and conveyor at the inlet which make sure that the cut ensilage will get into it, and a swivel joint for the steel pipe at the outlet. The combined fly wheel and fan is mounted on the cylinder shaft and the Blower, while traveling at normal speed—600 revolutions—will elevate the ensilage into any ordinary silo as fast as it comes from the cutter and it is safe. Sizes No. 13, 16 and 18 Self Feed Cutters are also made with this kind of an elevator. Send at once for New Illustrated Catalogue. Manufactured by

THE SILVER MFG. CO., SALEM, OHIO, U. S. A.

VOL. LX. No. 2691. NEW YORK, AUGUST 24, 1901. $1 PER YEAR

THE DAIRY TEST AT THE PAN-AMERICAN.

COWS THAT COMPETE AT THE CHURN.

No Robber Cows Here.

As many of our readers doubtless know, an interesting dairy contest is under way at the Pan-American Exposition. We have waited until now before describing it, in order that something like definite results might be given. There are 10 herds in competition—pictures of typical specimens of the breeds being shown at Fig. 253. The object of the test or contest is "to demonstrate in a practical way how cheaply milk and butter can be produced, under certain given conditions, with the various breeds of milch cows." Five animals from each herd were selected. They are not perhaps the best cows that could possibly be found, but they are all good working animals and quite representative.

A roomy and comfortable stable has been provided. Each herd of cows is kept together, and all are given the best of care. It might be said that the average cow in the average barn is not so comfortable as these cattle, and that therefore the test is not an "average" one. The answer is that these cows are daily surrounded by strangers. Their work is done in the midst of excitement and noise—quite unlike the calm life of the cow in some cool and shady pasture. It seems to us that this test is, on the whole, the most practical and business-like that we have had. Each herd is under the care of some person selected by those who own or manage the cattle. These managers select the feed and care which they consider best for their cows. For example, those who are responsible for the Holsteins or Brown Swiss cows may consider that they can make a better showing with more roughage and less grain. They have a right to feed twice as much hay as the other cows receive if they like, but every pound of feed or fodder is charged to them, and accurate accounts are kept with each cow. The following values per ton have been placed on what the cows eat: Oil meal, $35; bran, $15; ground oats, $18; cotton-seed meal, $25; cornmeal, $16; gluten food, $16; peameal, $25; clover hay, $7; silage, $2; green food, $1.75.

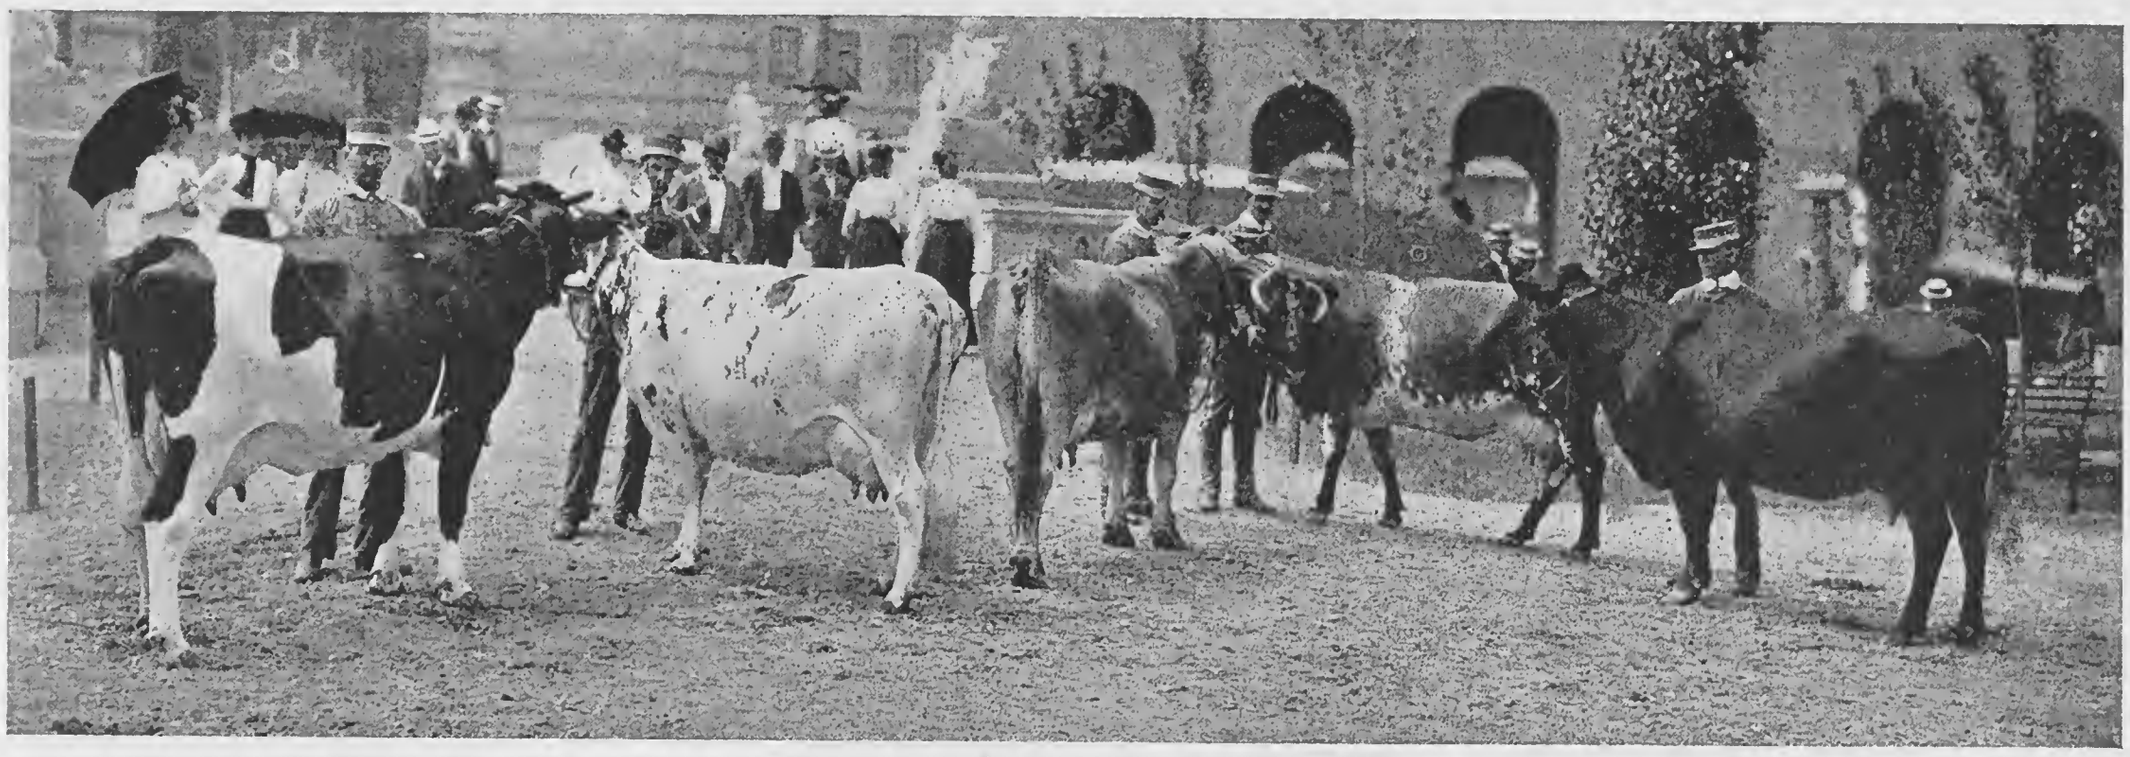
The food is kept under lock and key and accurately weighed out at each feeding. Each cow receives what her manager thinks will be the most profitable ration for her. Careful arrangements are made that no drugs or medicine are given any of the cows without the consent of the superintendent. As each cow is milked the milk is given to the superintendent, who weighs and samples it. The daily samples are mixed and tested each week by the Babcock tester. The cream from one day's milking of each herd is churned once each week, and precautions are taken in testing and sampling to insure accuracy. The value of the dairy products is figured at 25 cents a pound for butter, allowing 85 per cent of butter fat to the pound of butter. One of the most interesting things in connection with the test is the exhibition of samples of butter made from the cream of the different breeds. No artificial coloring matter is permitted, and it is evident from the showing made that the Guernseys, in particular, do not need any.

Prizes are offered as follows:

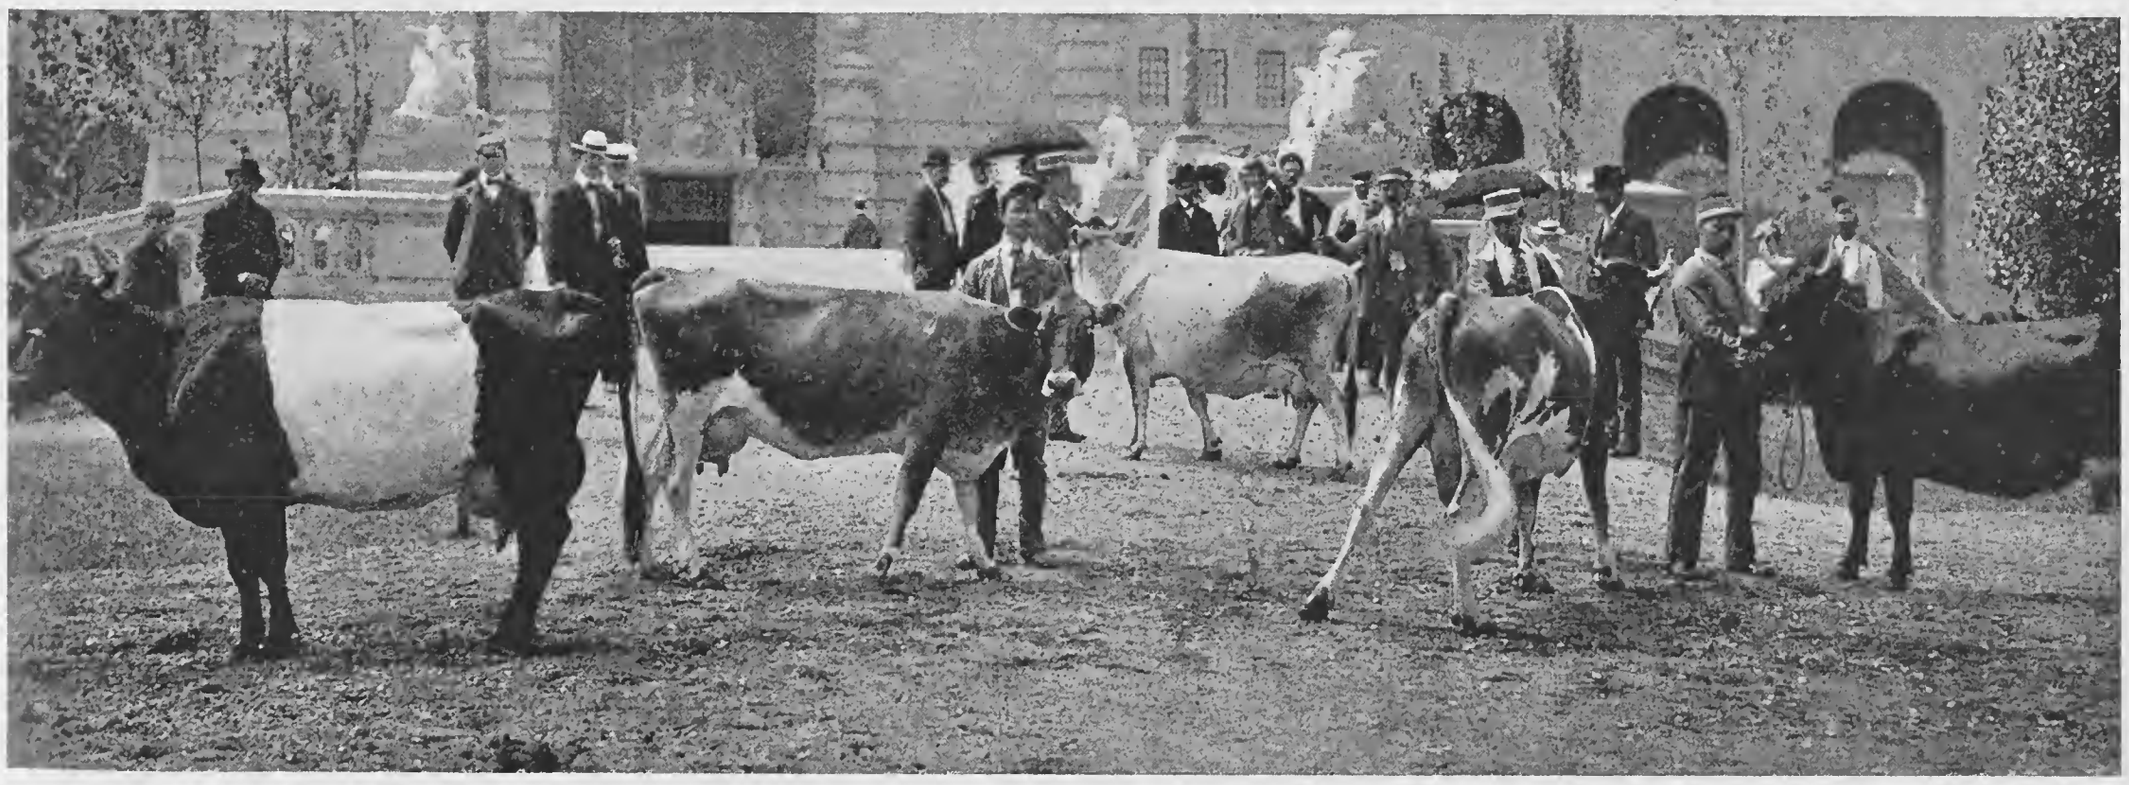
"A prize shall be awarded for the herd showing the greatest net profit, butter fat alone considered, as determined by the Babcock test.

"For the herd showing the greatest net profit, butter alone considered, as determined by the churn.

"For the herd showing the greatest net profit in total solids, and in loss and gain of live weight."



HOLSTEIN. AYRSHIRE. BROWN SWISS. SHORT-HORN. RED POLL.



DUTCH BELTED. POLLED JERSEY. JERSEY. GUERNSEY. FRENCH CANADIAN.

SOME OF THE COWS TO BE FOUND IN THE GREAT PAN-AMERICAN DAIRY SHOW. FIG. 253.

The following table shows how the various herds stand after three months of the contest. This statement includes the totals of each herd up to and including the week ending August 6:

Name of herd.	Lbs. milk.	Amt. of butter.	Value at 25c. per lb.	Total cost feed.	Profit.
Guernsey	16578.6	862.10	215.52	76.98	138.54
Ayrshire	19976.7	838.95	209.74	77.57	132.17
Jersey	16081.1	826.90	206.73	75.14	131.59
Holstein	22715.7	832.25	208.06	85.46	122.60
Red Polls	17554.7	792.82	198.20	77.79	120.41
Brown Swiss	18886.1	777.48	194.37	84 47	109.90
Short-horn	19159.8	760.21	190.05	88.70	101.35
Polled Jerseys	12280.7	647.19	161.80	60.54	101.26
French-Canadian	15137.5	669.89	167.47	66.16	101.31
Dutch Belted	14179.9	548.84	137.21	72.21	65.00

Thus it will be seen that the Guernseys lead, with Ayrshires and Jerseys close behind them. There is quite a difference in the way these cows are fed. The Guernseys have eaten $46.65 worth of grain; the Jerseys, $48.21; the Ayrshires, $48.66; the Holsteins, $54.69, and the Short-horns, $56.47. One would think that the larger cows like Holsteins and Short-horns would be fed heavily on hay, since it is a part of the argument made for them that they are masters at disposing of roughage. The fact is, that both of these large herds have eaten less hay than the Guernseys, although they have each used about two tons more of silage. Possibly at the close of the test it may be found that the Short-horns and other heavy breeds, while falling behind in butter production, have gained in flesh, and this will be credited to them at three cents per pound live weight.

The next two months will prove the most interesting of the test. Possibly some of the breeds now behind will be better stayers and pass the present leaders. We hope to give several studies of the cows, with opinions of expert dairymen based on these test performances. The test is in charge of E. Van Alstyne. He is a practical dairyman and thorough student of the cow. He has an able corps of assistants, and it is gratifying to know that the test is in charge of such thoroughly honest and capable men.

VALUES OF FARM PROPERTY.

How do agricultural values of farm property in your section compare with those of 20 years ago? Has there been any increase in farm land values for purely agricultural purposes?

DEPRECIATION IN NEW YORK.—Selling value of farm lands in this locality, as compared with 20 years ago, have, in my belief, depreciated more than one-half, and when sales are made very small payments are given on the purchase price. This is a good fruit locality, especially apples. F. B.

Yates Co., N. Y.

INCREASE IN ILLINOIS.—The farms here have increased over double the value of 20 years ago. Land that could be bought for $45 or $50 per acre 15 years ago will sell from $85 to $115 per acre for good improved farms well tiled. The agricultural values of land have increased, almost all being tiled, and more clover is raised than 10 or 15 years ago. F. A.

Braceville, Ill.

INDIANA LAND.—I bought 120 acres for $3,300 30 years ago. I repaired the farm, put up new house and barn, kept the farm 12 years and sold it for $7,000. The farm would not sell for more than $5,000 now. Ten years ago I bought 80 acres for $50 an acre, have repaired buildings and put in tile drainage. I will sell for $60 an acre. I rent 70 acres for $175 with buildings; that is a little over four per cent; then I must keep up buildings, fences, wells, windmill and taxes. Twenty years ago wheat was worth $1.25, now 65 cents. I do not know of any land that has increased in value. Farm crops do not yield as well as 20 years ago. It is a continual fight from Spring until Fall; Potato bugs, beetles, flies, lice and blight.

Butler, Ind. T. C. K.

GOOD VALUE IN WISCONSIN.—We bought this farm (160 acres) April, 1872, for $3,500; a few years later added 32 acres more to it at cost of $400. It is for sale now, and our price is $15,000. But it would not be fair to try to make it appear that the farm of itself had improved so much in that time. I have been in other business part of the time, and built a fine house in 1893, large barn in 1886, and silo in 1889, ice house, etc. The buildings are insured for $6,000. I asked a neighbor in regard to his farm of 100 acres, and he said that he bought for $2,500 a little over 20 years ago, and that his price now was $5,000; buildings no better than when he bought. He was offered $2,000 for a 40-acre lot with no buildings, and the land is no better than the rest, as I have cut grain on nearly all of it. Another neighbor who joins us on the south bought for $2,500 about 15 years ago, and his price now is $4,500, and the buildings are about as then. He improved the farm wholly from the farm, except perhaps by keeping a few bees. I know of one or two which could not be sold for as much now as they could a few years ago, but in those cases the people are not up to date, or perhaps might be classed as shiftless. I am quite certain that nearly all the farms in this county and many other counties in the State are worth from one-fourth to one-half more to-day than they were 15 to 20 years ago. I think raising cattle has helped the value more than any one thing perhaps, although some got rich 10 years or so ago in raising potatoes about here, but the Germans are our best farmers, I think, and they keep lots of cattle, hogs, etc. S. S. C.

Waupaca, Wis.

MASSACHUSETTS LAND.—I do not think that the values of the farms about here have increased any; they are about the same as they were 20 years ago, although assessors tax them for a little more, which I think is due to having water, light and new brick schoolhouse. We also have the electric cars running through the town, which perhaps makes some of the property more desirable. I think that we raise larger crops than we used to, as we buy large quantities of dressing from Boston, and go in for market gardening, also small fruits. I do not know of any increase of farm values in this neighborhood. I think that the farms will sell for about the same as 20 years ago. C. R. W.

Billerica, Mass.

PENNSYLVANIA COAL HELPS.—The best farm lands rate here now at about the same value as they did 15 years ago, and while they are not so productive as then, they sell more readily, because of the rapid development of extensive coal mining operations which have largely increased the non-agricultural population, thus affording a ready market near home for our farm products. The Pennsylvania Railroad Company also employs many men here now, which adds much to the business of our little town. But farmers in this county are now prospering mainly from the sale of the coal underlying their lands,

OLD APPLE TREES AT HOPE FARM. Fig. 254. See Page 683.

and many mortgages have been lifted by this means, and a wonderful improvement in the appearance of farm buildings has also taken place within the past two years for the same reason. This county (Cambria) is fast becoming one of the wealthiest in the State from its large production of bituminous coal, and the outlook for the energetic and well-to-do farmer appears to be quite encouraging. G. W. S.

Wilmore, Pa.

IN TENNESSEE.—From what I can learn, farm lands in this section have appreciated within the time you specify about 25 per cent, and farm products about the same. The farm I own was purchased about two years ago at an advance of 20 per cent over what it sold for seven or eight years ago. It is generally said that I bought it cheap. An advance of 50 per cent would not tempt me to sell it. I am of the opinion that farm lands do not sell readily for this reason. A greater circulation of money may be found where manufacturing interests or mercantile pursuits abound, and as man is prone to look for means to make money quickly he leaves the peaceful farm life with its conservatism to engage in more active life with a proportionate risk. I am one who believes in "not so much money but more farm life." J. W. B.

Sweetwater, Tenn.

MICHIGAN VALUES.—There has been quite a depression in farm lands for several years in this neighborhood, and yet there has been perhaps more land changing hands here than in many other places, as the town south of us is settled with Germans, and the young people are inclined to stick to farming, and have to be supplied with farms. But there has been quite a noticeable increase in land transfers, at least in this immediate vicinity, in the last year, and at slightly increased value, although the call seems to be for small farms from 40 to 80 acres, the purchasers being careful not to incur too heavy a debt. As to the value of my own farm, when I purchased it 13 years ago it was nearly all wild land, and very poor buildings. I have made quite a change in the farm and buildings, and, of course, increased the value of the property. C. F. W.

Adair, Mich.

VERMONT FARMS DOWN.—I think farm values 25 per cent less than 20 years ago, perhaps 20 per cent less than 15 years ago. There seems to be a general dislike to farming, and most of the farmers think they are working too hard and too many hours for the pay they get, as compared with other industries. It is also almost impossible to get help, either indoors or out to work on farms, and it seems to be growing worse from year to year. It is much harder to get help now than it was even five years ago. Farms do not sell with the exception of forced sales to settle estates, and these have to be sold for a mere pittance compared with the prices when inflated by the influences of the Civil War, the prices being one-third and some even as low as one-fourth the sum paid for them in the sixties. I have in view a near farm that a man paid $6,000 for in those days, and his son paid $2,000 for same two years since to close the estate. Another, one of the best dairy farms in town, was appraised at $12,000 when owner died about 20 years since, and two years ago was sold to grandson for $5,000 to close estate after having been rented trying to find a buyer for several years. These two cases seem to be a fair sample of all the farms in this section. Otter Creek interval, which has sold for $125 to $135 per acre, has sold under the hammer for $60 per acre within two years past, and located on a fine road only six miles from Rutland, a fine city of about 12,000 inhabitants. Agricultural values of farm lands have not kept up, but have fallen so low that it does not seem possible for them to shrink any more. Agricultural products, of course, are governed by supply and demand as to prices. Farm help hear the whistles blow, and that makes dissatisfaction as to hours and consequent dislike to farm work. My own farm was purchased in the Spring of 1865, when prices were inflated to their highest, and consequently would not sell to-day for 50 per cent of what I paid for it—although I have spent about $5,000 in addition to purchase price in repairing the buildings. It produces more and is in better shape than when I bought it 36 years ago. The reason is because of the general depression in real estate around, as so many are anxious to sell at any price. I do not recall a single instance where any real estate has increased in value in this vicinity for several years. I sometimes think that the fraudulent manufacture of food products, like oleomargerine, sold as butter, and the many kinds of pure Vermont maple syrup and sugar manufactured in Chicago have had a great influence in depressing the prices of the real to a non-paying business, and consequently help to make the farm profits much less. N. S. W.

Chippenhook, Vt.

FARMER AND COMMISSION MAN.

I wish to enter a protest against the idea you convey—at least, that will be drawn—from your editorial on page 536, when you tell of the two men playing tennis, and the farmer working hard. There are too many farmers now who are almost chronic grumblers because they feel they do not get their just dues, and you only add impetus to this disposition to kick and complain. The farmer works hard, if he makes a success, but he also has his play days. You will find very few farmers who work as hard, either mentally or physically, as an up-to-date successful commission man, and he richly earns his play time. To be a success in a city like New York he must be up and going, wideawake at all times—it is a gait that kills, and there needs must be a play day. I am not and never have been, and hope I never will be, a commission man, but I am and have always been a farmer, and I think I can do both justice. One would infer that you thought the commission men should have gone to the field and helped the farmer get in his hay. Quite likely they knew nothing about handling hay in the field, and would have been a hindrance instead of a help, fully as much so as the farmer would be trying to help them in a rush time on Washington Street. The farmer's wife fully deserves all the sympathy you can give her. She has a hard time, especially in the East, with all the farm hands to cook for. Down here the farm hands feed and house themselves, but I have no doubt the commission men were paying good board, as I have always found them liberal, and the farmer's wife was glad of an opportunity to get a little extra pin money. Besides, she would catch a few moments each day from her labors, for a little talk with these men, and these talks gave her glimpses of other life. This to a degree was a rest and recreation to her, and if they told of the hard life of some of the city's poor I have no doubt but she was thankful that she had a home and something to cook. S. H. G.

McIntosh, Fla.

SHORT BITS OF FARM PRACTICE.

Practical Experience Boiled Down.

FERTILIZER ON GRASS.—We like to put a top-dressing of commercial fertilizer on the newly-seeded pieces, or those giving a good crop of Timothy, right after haying. It helps to bring a nice crop of rowen, and the crop for the ensuing year is pretty well insured, whether the season is wet or dry. We use a formula about as follows, putting on 500 to 800 pounds per acre: 300 pounds nitrate of soda, 400 pounds muriate of potash, 800 pounds dissolved S. C. rock, and 500 pounds tankage or cotton-seed meal. If there are any rains after haying, and there usually are, this will get right to work, and after the rowen is cut an aftermath will come up that is a great Winter protection. We try not to leave any bare fields for the Winter winds and snow to carry off all the fine best soil, but if too late for a crop put on rye. It often will furnish good pasture feed even when sown late, and prevents soil washing.

EXTRA POTATO BEETLES.—Every year we hear the same old story that Potato bugs are worse than ever before, but somehow we believe it this year. We have seven acres, and have used already 24 pounds of Paris-green, and some of the potatoes need going over again now. This potato season is something of an enigma; varieties that are usually mature about July 15 are now (August 7) in blossom and have been blossoming for a month. Potatoes have set, but seem to grow very slowly. Vines are luxuriant and would seem to promise full crop, yet it is not there, and we don't know when it will be. It makes one rather tired not to have potatoes to sell, but rather have to buy when they are wholesaling at $1.75 per bushel. No such price known here before, but it has been fully that for two weeks. A few have dug potatoes, but we have yet to find one who has a fair yield.

SELLING BLUEBERRIES.—One of our retail milkmen gets $150 to $200 every season from his pasture lot that doesn't pass through the cow as grass and come out milk. His pasture has a large number of blueberry (sometimes called billberry) bushes which, as the land is well fertilized by the cows, bear every year a fine crop of good-sized berries. He takes one or two crates every day on the milk wagon, and readily disposes of them at an average price of 10 cents per quart. This does not take over a half hour extra per day, and as the season lasts from four to eight weeks quite an income is secured. One man will pick from one to two bushels per day, and as they come in after haying, they are a profitable crop that requires no care and no outlay.

CABBAGE PLANTS.—In the Spring we set out two lots of cabbage plants, mostly the same varieties, one lot from a local greenhouse, fine-looking plants taken right from the house to the ground, and set out on an ideal day, which at once began to grow. A few days later the other lot came 75 miles by express, was not promptly delivered, so there was a day's delay in setting. They were the meanest plants we ever saw, had been grown too thickly, and had long twisted spindle shanks. We hated to set them out and were tempted to write the sender a letter that we should hope would give him the blues. They were cold-frame plants, and were slow in starting, but they left the greenhouse plants, and we are selling a lot of extra fine cabbage from them. From the first lot hardly a head has as yet become salable. We can hardly account for it, but are glad we didn't write that letter. A lot of spindly cauliflower plants from Maryland that we were tempted to throw away grew finely, and good heads are now forming.

POOR HAY.—In a town only a few miles from here it is quite a common custom not to begin haying until the latter part of July and the first of August. The reason is that they can then get their extra help at from 50 to 75 cents per day cheaper. If the weather isn't good, and it often is not through August, you find them haying into September. Another advantage of this late haying is that it can be cut and put in the barn the same day, no tedder required, and it saves any labor of cocking and opening again. This isn't a fanciful sketch; it is truth. These men have never studied feeding cows for profitable results, nothing of protein or profitable dairy feeds. They keep cows and haying is one of the dreaded incidents that must be got through with as cheaply as possible. No silos in town. They are not making any money, and never can, and their farms are growing poorer every year. The boys leave them just as soon as they can, because there's no money and no pleasure in this style of farming. They are set in their ways, and it would take quite an earthquake to get them out of the ruts they are in. Talk about cutting hay in June, and they would laugh at you, and say that there wouldn't be any to cut then. It's about so, for they pastured the meadows so late in the Fall and early Winter, and forgot to put any manure on them, that the grass doesn't get very far by June. The farms are going down in value yearly, and it is rather a discouraging outlook. Cities need their college settlements, but towns like this are equally in need of an up-to-date dairyman who will run a farm on right principle, and make money out of it. You will find them laughing at first, but gradually you will find them copying his methods, and a different style of farming will ensue. H. G. M.

OCTAGONAL BARNS ARE NOT PRACTICAL.

I wish to build a barn in the near future, and have part of the frame material on hand, but lumber has risen greatly in price the last few years, hence I have thought of using a plank frame instead of the old style heavy frame. My barn as planned was to be 42x60 feet, and 20 feet high at the eaves. Barns in this region are now built high, as it increases the storage capacity greatly. A barn of that height will hold double the amount of dry forage that the old style 12 to 14-foot barn held, and with the hay unloading appliances now in use the necessity of elevating the hay to that height is no hindrance. Thus the high barn is economical in space and also in cost, as it requires no more roof and foundation than a low barn, and yet has so much greater space, and the cost of the two last named items is of importance. These frames then are set upon basement frames and we have the whole basement for stabling live stock. At present the silos are being built here, and I have given some consideration to the project of building an octagonal barn, with a tub silo in the center, feeding alley next to that, and the live-stock stalls next, the animals thus facing the silo. I should want the barn to have a basement to be used for the live stock, and to have a drive floor above for hauling in and unloading hay, grain and stover, and also for cutting silage. I should expect to build silo 25 to 30 feet high. I have no definite plans, and want information as to whether the scheme is practicable. The matter summed up in a simple question is this: Is it practicable to build an octagonal barn with silo in center with stalls in basement around silo, drive floor above, the frame of plank? J. B. M.

Grantsville, Md.

REPLY BY JOHN L. SHAWVER.

Your correspondent is correct in desiring a barn of good height, and 20 feet above basement is all right. I would prefer 40x64 to 42x60, as we would thus find four spans of 10 feet each in basement and four spans of 16 feet each in superstructure. Though octagonal and circular barns make a good appearance, and enclose slightly more space than the rectangular barn, yet much of this space is useless, because of angles, and for the same reason there is quite a good deal of waste in cutting the material. In constructing the second floor alone there is a waste of several hundred feet of timber. Besides that, I would not place a silo inside the barn at all, but build it at one end or side, entirely separate from the barn, to avoid much of the odor from the silage, which becomes obnoxious inside the barn. The inquirer can use the plank system on an octagonal barn very advantageously, but I believe that if he investigates the matter well he will never build that shape. I know of several who have built octagonal barns who say that they would not do so again, and some who have built their second barns rectangular. The round and the octagonal barns are much better for the eye and the imagination than they are for the pocketbook or the farmer's convenience.

THE ERYNGIUM OR SEA HOLLY. Fig. 255. See Page 582.

HEAVY GRASS IN CONNECTICUT.

You ask in a recent issue of The R. N.-Y. for reports from those who have tried the "Clark method" of grass seeding. I have read for some time about this method, but never tried it until last season (1900) and then I was not able to give the land the many repeated harrowings and cross-harrowings thought necessary by Mr. Clark, neither did I have one-half dozen or more implements that are manufactured by Mr. Clark to do what I did on it. True, I had the Cutaway harrow, but not another of the Clark tools. My land is a heavy clay loam, lies sloping towards the west mostly, and this five-acre piece, which I seeded on September 1, 1900, has been in grass for five or six years. It had been mown every year, sometimes once and in its earlier seeding twice if weather was damp enough to produce a second crop, until it had nothing on it in 1900 but daisies. We covered two acres of this piece with barnyard manure and plowed it in, after the daisies began to bud, letting the land lie without cropping. After haying was completed we harrowed this two acres with the Cutaway harrow repeatedly until very mellow.

Three acres lying beside the two already plowed were plowed after August 1, 1900, and these were also worked with the Cutaway harrow many times, how many I do not know, but much more than I ever did any other piece in my life; in fact, we worked that five acres so mellow that it was practically dust. Then we put 500 pounds of Mapes corn manure on the three acres plowed after August 1, distributing it with a Missouri drill evenly. August 31 it was reharrowed again with the Cutaway harrow, and September 1 it was sown and rolled in with a roller. I used a bushel of seed per acre, 14 quarts Timothy, 14 cleaned Red-top and four Mammoth clover. In a night or two we had a very fair shower, and the seed came up and looked like a lawn. The continued dry weather of the Fall of 1900 was not conducive to its benefit, and it pined and died out somewhat, but this Spring we had rain galore, and it took on new life and looked fine. About May 1 we sowed 200 pounds per acre (on the whole five acres) of corn manure. The hay is now in our barn, but has not been weighed. Some time this coming Winter it will be sold, and then it will be weighed. I had 14 large loads of hay on the five acres and I *guess* about 20 tons. When it is weighed I will let you know the amount. I made one mistake in seeding, that was in not going over our land after the last harrowing with the Cutaway harrow, with a smoothing harrow or a weeder. The seed lodged in the hollows made by the Cutaway harrow teeth, and the lot looked as if the grass seed had been put in with a drill. The next time I do this kind of a job I shall take my Success weeder (and it is a grand success by the way) and harrow the land both ways, thus distributing and mixing the seed evenly all through the land, and then roll it.

Connecticut. NEWTON OSBORN.

R. N.-Y.—Two years ago we described Mr. Osborn's farm and methods of fertilizing. He has been in the habit, we think, of seeding to grass with grain, following much the same rotation as that of Mr. D. C. Lewis, in New Jersey. This experience shows what can be done with "cutting across the rotation" on an old meadow. Mr. Clark does not claim that his tools are absolutely necessary to produce a good yield of grass, but we think he is right in saying that some form of digging harrow is needed.

Farmers' Club.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

SHEEP AND SILAGE.

The following statement was received from one of our readers in the Winter at sheep-feeding time. The answers may be useful now:

"I put up a 12-foot tub silo last Fall for my sheep, but they think they are abused if I make them eat silage. If I fed them all the bean fodder twice a day they will eat, they don't eat much silage. It has considerable corn in it. I have a tight board cover, and feed from one-half the silo, and feed about three inches from one-half one day and turn the cover and feed from the other side. The silage is bright and nice, not moldy at all. The corn had just begun to glaze (not much). Did I put it in too ripe or too green?"

We are feeding silage to our sheep, and they eat it well. We feed clover hay and silage. I suppose if we fed all the clover hay they could eat they would not take the silage, at least at first, until they had become accustomed to it. I think the trouble described may be due to the fact that he gives the sheep too much bean fodder. If he will withhold that somewhat, and teach the sheep to eat silage I think he will have no trouble. Young sheep do not take so kindly to silage as do old, mature ones. The silage described seems to have been put up properly and to have kept well. The trouble seems to be with the feeder, not with the feed.

L. A. CLINTON.

From the description here given I can see nothing wrong about the silage and do not understand why the sheep don't eat it. It may be that this man expects them to eat more than they can. He should remember that an ordinary ewe weighing say 75 pounds should not be fed more than three pounds per day, or at the usual rate of four pounds per 100 of live weight. Now of good silage it does not take much to weigh that, and he may think they ought to eat much more. If they do not readily eat that quantity there must be something wrong with it, but from the description given, and without seeing it, no one can tell what it is. We have been feeding silage to all our sheep for a good many years, and never find any trouble in getting them to eat it. When we commenced to feed it we had the notion, then universal, that silage was not good for sheep, and when we fed the first lot, we selected a lot of the poorest old ewes in the flock, and fully expected some of them might be killed in the experiment, but to our surprise and joy we found them doing the best of any sheep in our barns, and soon the feeding of silage was extended to all our sheep, even the ewes raising Winter lambs I don't see how this man can make a success in raising Winter lambs without plenty of some kind of succulent food. We cannot, and if he is feeding no roots it must be that his ewes are eating more of the silage than he thinks, or surely the lambs would not get milk enough to do their best. We like to feed our ewes with Winter lambs both silage and roots, but if we could have but one would prefer silage. I suggest that he weigh the silage and see whether they are not eating enough (four pounds per 100 of live weight). J. S. WOODWARD.

Planting Seckel Pears.

W. M. T., Ogden, N. Y.—I have room for one row of large pear trees. I want them to be Seckel. Would it be better to set that kind, or some variety that would be more hardy and grow faster, and then graft? If the latter, what variety should it be?

ANS.—Seckel makes a good tree, as it is hardy, nearly free from blight and grows quite freely as a standard. I would be in no wise doubtful about planting the Seckel for the desired purpose. H. E. V. D.

A Lazy Mulberry Tree.

F. H. H., Fayetteville, N. Y.—We have a thrifty mulberry tree, about six inches in diameter, but to my knowledge it has never borne fruit. A tree in a neighbor's yard, very similar in appearance, bears profusely nearly every year. Can you tell me why ours does not fruit?

ANS.—Some mulberry trees have imperfect flowers, and in a few cases they are so much so that they will not bear even with those having perfect flowers in close proximity. I have never tried grafting the mulberry, but I believe it can be easily done. The New American is the best variety I know and the one I would suggest for trial. It is as hardy as any of our native mulberry trees.

H. E. V. D.

Apples and Plums for Kentucky.

A. B., Paducah, Ky.—I have a small orchard of peach, pear and apple trees. My pear trees are in bad condition. The bark gets black in spots and tree dies loaded with pears. I cut off the top limbs. Was that right? What is the best Winter apple to plant here? They grow poor fruit here. I believe they plant the wrong kinds. We have several Wild Goose plum trees, but do not get much fruit.

ANS.—Blight was the cause of the trouble with the pear trees and it was the proper thing to cut off the diseased branches. The danger is in not getting below the diseased parts. Winesap is a good Winter apple for your section. Wild Goose is a very common plum, bright red in color; it is not very prolific when planted by itself, but when planted near Smiley, Milton or some other variety of plum that will pollinate its flowers it bears very well.

H. E. V. D.

Early Apples for Virginia.

A. R. L., Barboursville, Va.—I live in the Piedmont section of Virginia and wish to plant a few apples for the Summer market. None but large ones pay to ship at this season. Give a short list of those varieties that you think most suitable. Also give description of the Keswick, both of tree and fruit.

ANS.—There are few apples that are large and attractive looking that ripen at any time during the Summer. Oldenburg is one of medium size that will ripen in Virginia in July and August, but it is too poor in quality for any use besides cooking. It is a most productive and hardy tree. Chenango is larger, most beautiful red striped and of good quality. Lowell is a yellow apple of the same season that is well liked for both home and market use. It makes a fine orchard tree and bears regularly. Keswick is a second early apple that is of medium size, roundish conical shape, greenish white color, and is intensely sour. The tree is of medium upright growth. H. E. V. D.

Raspberries, Lawn and Strawberries.

A. G. (No address)—1. When shall I cut the old canes from my raspberry bushes? Is it better to do it as soon as they are through bearing or not until Fall? 2. Also about my lawn. It is just full of Witch grass, and that is killing all the other grass. How can I get rid of it? 3. My strawberry patch is almost ruined. The plants were thrifty and full of green fruit, when a small green worm attacked the leaves. I tried some Slug Shot but it did not seem to help matters. Then a blight struck the plants, and many of them died. I cut off all the eaten and dead leaves and burned them, but the patch has never recovered its thrifty look. Do you believe they will be worth saving and working over, or would you advise just spading them under?

ANS.—1. Old raspberry canes are best cut out as soon as through bearing, as they often interfere with the new growth and are of no benefit after the crop has been produced. 2. If your lawn is well fertilized, and closely clipped once or twice a week, the undesirable grasses should diminish. Frequent applications of a good complete chemical fertilizer during rainy weather and constant clipping will do wonders for an old lawn, though some of the grasses with creeping rootstocks are very persistent. 3. It would seem better to give up the fight with the affected strawberry bed and start a new one. Spraying with Bordeaux Mixture and dusting with powdered hellebore would seem promising remedies.

Are Mulberry Trees Self-Fertile?

F. W. B., Antwerp, N. J.—Are mulberry trees dioecious? If not, what would you advise doing for a tree that blossomed full each year but bore no fruit?

ANS.—The mulberry is generally monœcious (that is, having flowers of both sexes on the same tree). Young specimens of the mulberry tree often produce few staminate blossoms. As they grow older the balance is more likely to be restored. It may be well to graft your tree over with scions from a good bearing tree.

Where to Put the Manure.

A. H. S., Clarendon, Mich.—I have about 20 loads of good manure, mostly fit for top dressing. I am only going to put out six acres of corn ground to wheat, but have some clover and Timothy sod that I shall plant to corn. Would it pay me better to leave this and haul the manure out on my wheat ground after cutting the corn, or haul out now and spread evenly on the sod to be plowed under in the Spring?

ANS.—It will depend on circumstances. In our own farming we would put the manure on the corn and consider the corn ground strong enough to produce a fair crop of wheat. If the corn was well manured last year we would leave it as it is, and use all the manure for the corn. If the corn was not well manured we would plow the manure in for the wheat.

Lime for this Soil.

J. K. B., Hagerstown, Md.—On a sandy farm (Potomac River land) where South Carolina phosphate has been sown for years, the land seems to be getting full of sheep sorrel and land cress; would lime be beneficial? The same land raises good wheat and fair corn, but we are unable to get a stand of grass; what change in the fertilizer would bring better results?

ANS.—We think that lime would surely help such soil. The sorrel is a pretty sure indication that the land is sour. Continued use of S. C. rock tends to make such soil acid. From 20 to 25 bushels of lime spread after plowing and well harrowed in will enable you to secure a much better catch of grass. Do we understand that you have used nothing but the S. C. rock? If so, muriate of potash and some form of nitrogen will pay, but probably lime is the element most needed now.

Disease of Peach and Quince.

C. Q. E., Mystic, Conn.—I send samples of diseased peach and quince. What ails them and what can I do?

ANS.—The peach seems to be affected with the brown rot fungus common in the West and South. The fungus affecting the quince fruit and twig is not so easily recognized, but is apparently very destructive. The only promising treatment would seem to be to remove all affected fruit and twigs and bury or burn them. Nothing further can be done this season. Next Spring before the buds open both peach and quince trees could be sprayed with Bordeaux Mixture of full normal strength (six pounds each of lime and sulphate of copper to 50 gallons of water), and the quince again with the full strength after the flowers fall, about the middle of June. The peaches may be sprayed in the same way, except that after the foliage appears the strength should be reduced one-half (three pounds lime and same of copper sulphate to 50 gallons of water). Thorough work of this kind will probably save your orchard from future damage.

The "Bag-Worm" on Evergreens.

L. B. H., Coatesville, Pa.—I have an evergreen tree on which I noticed a few cocoons this Spring. Within a few days small black worms enclosed in similar coverings or cocoons began coming down the tree. We did not notice them until they had spread to other trees, going along the grass and up the trees. We destroyed the original tree at once and all the insects we could. What have we and how can we get rid of them?

ANS.—The "cocoons" proved to be the cases made by and within which the caterpillar known as the "bag-worm" lives. The caterpillars carry these bag-like homes about themselves, sticking out their heads to feed and to crawl about. This bag-worm bears the jaw-breaking scientific name of Thyridop-

The New Horticulture

BY H. M. STRINGFELLOW.

We do not hesitate to say that this is one of the most interesting books on horticulture that ever was printed. Most reading farmers have heard of the now famous "Stringfellow Method" of planting trees, but few understand clearly what it is. This book tells the whole story in clear-cut, forcible style, which all can understand. Not only is the theory of close root-pruning carefully explained, but the general principles of gardening and fruit-growing are discussed. Mr. Stringfellow is a practical gardener, and he gives his own experience. We commend the book to all without reserve. New Edition, paper covers, 50 cents.

THE RURAL NEW-YORKER, New York.

teryx ephemeræformis, and it is a common pest on evergreens, maples and other shade trees in Pennsylvania and southward. The adult male insect is a small winged moth, but the female has no wings and is simply a larva-like bag of eggs; she does not leave the caterpillar case or bag. The insect winters in the egg stage inside the bags. Hence, much can be done to check this pest by picking off and burning the bags containing the eggs during the Winter. Many of the bags will be found empty, and these are the ones from which the males were developed and emerged. It might be practicable in some cases to pick off and burn the caterpillars in their bags. When they are feeding in Summer, one could easily feed the caterpillars Paris-green or other poison by simply spraying the infested trees thoroughly. We would never cut down the tree. M. V. SLINGERLAND.

Anthracnose on Raspberries.

A. P. V. D., Amity, Pa.—My black raspberries show patches of disease or fungus on the canes, and are losing vitality. What is the trouble?

ANS.—Your raspberry canes appear to be affected with anthracnose, which, as you say, is a fungus disease. It appears in patches scattered all over the canes, which become feeble and grow slowly, finally breaking down when the disease is far advanced. The patches you see on the canes are merely the fruit or seed-bearing portions of the fungus plant, which consists of a network of vines or threads, growing through the substance of the canes and feeding upon the sap. As most of the fungus grows inside the cane, spraying will not entirely cure it. The best plan is to cut away all diseased canes, dig up the roots, and burn the plants to prevent further infection. Spraying several times during the season will prevent the remainder from becoming infected. Healthy young plants may be set in the vacant spaces, but they should be carefully watched to see that the disease does not recur. We are sorry to say that no certain cure for this destructive disease is known. It is probably best in the end to abandon the ground and set a new patch with healthy plants in uninfected soil.

EVERYBODY'S GARDEN.

MUSTARD SEED.—D. W. D., Hickman, Ky., asks how to clean onion seeds. He wishes to free them from husk to sow with Planet Jr. seed drill. Harvesting the seed must be done in the nick of time, else it is attended by considerable loss, and as it ripens unevenly the safe plan is to gather as rapidly as it ripens. As soon as the heads turn brown they should be gathered by clipping with five or six inches of the stalk. If ripe enough to shell, gather in tight boxes or baskets, and spread on a tight floor, where the air will have free access. Frequent turning will assist the drying, which should be done as rapidly as possible. When thoroughly cured pound out with a flail, or small amounts may be thrashed out with a stick or with the feet. The cleaning is easily done with the fanning mill, or lacking this, they may be winnowed by hand. Spread down a sheet or blanket, fastening down the corners to prevent the wind from blowing it away. Hold the seed high and pour slowly, and a moderately strong current of air will take out most of the refuse. Repeat the operation until clean. If too much chaff still remains, or much shrunken seed is present, pour the seed into water; the good seed will settle at the bottom, leaving the chaff and shrunken seed on top where it may be poured off. If water is used the seed must be dried without delay by spreading on cloth and exposing to the sun and air. If the husks or seed cells adhere to the seed there is but one conclusion, viz., the seed was gathered when too green, and in that case the risk of sowing it would be too great; and I would advise not using it even if other seed had to be purchased. In gardening there are but few things more disastrous or annoying than the loss of a crop through sowing poor seed.

The same inquirer also asks: "Is there any profit in growing black mustard seed for market? Give average price per pound." This answer involves several questions of prime importance. With the questions of favorable soil conditions and access to market settled, of which every man must be his own judge, other questions naturally arise, the first being the demand. The black or brown mustard seed is grown almost exclusively for medicinal purposes, or for use as a condiment or table relish. The available avenues for the output of the crop then, are the jobbers in crude drugs, the spice manufacturers or the seedsmen. In the crude drug trade the demand is not excessive, being only about as one to 100 in favor of the white seed. However, the demand is quite considerable even at this rate. In the spice trade the demand is much greater, and should be equal to, if not more than for the white seed, as the best brands of table mustard should contain an equal proportion, if not greater of the black seed than the white. Among the seedsmen there is considerable used, and is doubtless, like many other varieties of seeds, grown for them on contract. By writing personally to some of the many reliable seed houses a man might be able to contract advantageously with them for growing the seed.

In the drug and spice trade the California grown seed has the preference, while the southern grown is classed in a lower grade. This fact would enter as a harmful element of competition, which might, however, be eliminated, if cultural rather than climatic conditions are responsible for the disparity. All in all then the demand is evidently large. In the drug and spice trade the present prices would be about 5½ cents per pound. At these prices, the grower might perhaps realize four cents per pound. With these prices, and a yield of 25 bushels or 1,500 pounds per acre conservatively estimated, the returns would be $60 per acre. Doubtless the yield here is placed very low, but even these estimates would seem on the face to be quite enticing. There is, however, another side. The crop, while easily grown, is exhaustive to the soil, and at harvest time is particularly liable to damage or outright destruction through rain or dampness. Again, it is a moral impossibility to harvest and thrash the crop without more or less waste, and the seed thus wasted goes back into the ground and becomes a noxious weed of the worst type. Once in the land it will remain master of the situation, as to destroy it is well-nigh an impossibility. For the gardener, growing it as a salad or for greens, the work is safe and quite remunerative, as the crop is harvested before the seed pods form. Many farmers grow it for the seed, and doubtless at remunerative prices, but personally I would neither grow it myself nor advise others so to do on a farm intended for a life homestead.

STUDY THE MARKET.—A very important point in successful gardening is the market. It pays to cater for the best trade whether among dealers or private customers, and to do this successfully one must know their demands. For instance, the short or half-long varieties of carrots, the round or half-long beets, the green-podded or wax varieties of beans, all have their champions among customers, and a thorough knowledge of these facts often adds much to the profit side of the account. In many markets the prejudice as between the red and purple varieties of tomatoes is very strongly marked, and as to size many customers can hardly be induced to touch the extra large varieties no matter how superior their quality, until they have once been induced to test them. A very large tomato of exceedingly fine quality which I had the pleasure of first bringing into public notice in this country, was almost a dead letter for a time on account of its size. As they would not sell to any extent I gave away samples, with the result that since the first year of growing them I have never grown enough to supply the demand. Study the demands of your markets, and begin this Fall to save seeds with the eud in view of growing what will best suit your individual needs. The same reasoning will also hold good as to purchased seeds. J. E. MORSE.

Michigan.

Weeping Pipes and Chimneys.

A former experience of mine may help your correspondent. My office was heated with a wood stove that had a large door which closed tightly. Of a cold day I would about fill it with large sticks of dry hardwood. When the fire got going well I would close the draft and turn a damper that was in the pipe a few feet above the stove. The effect would be, of course, to hold combustion in check, and measurably prevent the heat from being carried up and out at the top of the chimney. Another effect would be that the pipe at the second elbow, where it changed from the horizontal to the vertical, would drip from the condensation of the gaseous products of combustion in the pipe above. This latter and undesirable effect I was able to prevent, as I discovered, by having one of the lengths of pipe above the damper made in such a way that whenever desired a large opening for the admission of air into it could be readily made. This length of pipe was double for about its middle third, a large oval opening being cut through the two thicknesses. By rotating the outer thickness, or jacket, the opening and closing of the aperture was effected. Whenever the draft of the stove was closed, and the damper in the pipe turned, my practice was to turn the jacket until the two openings came into correspondence. The air that would then be drawn into the pipe would carry with it the offending gases up and out at the chimney top. The ventilation of the room was, of course, provided for at the same time. The draft of the chimney was good. It only needed fair play.

Ontario. W. O. E.

I notice the remarks of H. E. M., page 541, in regard to dripping chimneys, and beg leave to explain the cause of the trouble with the stovepipe referred to. In my short note I gave the principle to which this dripping is due, and to go back to the principle is not always sufficient, for without a good deal of application the circumstances are not duly considered. Now, H. E. M. does not consider the rapid condensing effect of a stovepipe exposed so freely to the air, nor does he take note of the fact, which I think I mentioned, that ordinary dry firewood still contains about one-fourth its weight of water. The water is, of course, changed into vapor in which is mixed the pyroligneous acid of the wood, a spirit as we commonly call it, that is something which is—when hot—a vapor and when cooled is a liquid; and this is much more easily condensed by the rapid cooling of a stovepipe than it would be by the more easily warmed stone or brick of a chimney. I have been burning wood for 40 years, and at first studied out this matter on the principle given, which is scientifically correct, and then adapted my chimneys to it, and have had very little trouble since, except when a stovepipe is used to connect with the chimney and has an elbow in it besides, to act as a restraint on the smoke and vapor, and so produce an active cooling influence on the smoke and vapor, by which some of this condensible moisture is liquefied. If H. E. M. will discard the stovepipe, or encase it in the terra cotta pipes now used for this purpose, so as to avoid the rapid cooling of the hot vapors of the smoke, and run the stovepipe on a level into the chimney as near as may be, and will well season his firewood, and use it dry, the annoyance will cease. I am now burning dry wood, cut in the Summer, and keeping up seven fires in the Winter in my house, and there is no drip from three stoves; the other fires are in the open fireplaces, and have no trouble whatever, but when using green wood one stove which has an elbow in the six feet of pipe used, drips a little, enough to run down the pipe part way, the other pipes which go straight into the chimney do not drip at all. It would prevent the drip if the pipe in the room were double, as it would avoid the coldness of the inner pipe by which the acid is condensed. H. STEWART.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

THE TROUBLESOME MOLE.—Notwithstanding the multiplication of cheap mole traps, many cultivators remain at the mercy of these troublesome pests. A fair proportion of the correspondence received by agricultural papers consis s of inquiries for some means of checking moles. Many correspondents claim th t they have no success with traps and want some method of wholesale poisoning to clear their grounds of the destructive invaders, but the answer, when based on personal experience, must always be that moles cannot be successfully poisoned by any known method. They live almost entirely on earthworms and subterranean insects, though it is suspected that a taste for succulent roots and bulbs is sometimes acquired, and practically will not eat poisoned baits. The question of reducing their ravages comes down to the skillful and persistent use of traps, and if a little care is used in selecting the more permanent runway over which to set the traps, success is quite certain. The mole generally has his fastness in some uncultivated place, deep under rocks or stumps, and enters gardens and tilled fields to forage in the soft earth for his prey. The ensuing damage seems out of all proportion to his size and apparent strength, and though he is probably a strict utilitarian in his expenditure of energy it seems as though he upheaves our choicest plants and seed beds in pure wantonness, making many tortuous and superficial tunnels through which he does not intend to pass again. It is useless to place the traps on these temporary runways, but a little search should disclose one of a more permanent character, and some convenient point selected over which to place the trap. Many good traps are now on the market, costing from $1 to to $2.50 each, the cheaper ones often doing quite as good work if intelligently used. Most of these traps are designed on the old figure-four plan, and have a flat trigger or pan to be pressed down on the flattened runway, releasing the spring and pointed wires when it is lifted by the upheaval of the passing mole. Most failures result from premature springing before the mole is directly under the trap, as the earth pushes somewhat in advance, and the trigger should not be set closer than half an inch above the ground when finally adjusted. Given a judicious selection of location for the trap the runway should be closed, filling in compactly as narrow a section as possible, the trap firmly placed, springing it several times to make sure there is no obstruction to prevent free passage of the prongs to full depth, and then finally adjusting as above. The chances are that the mole will be caught as he returns. By prompt and persistent use of two very ordinary traps we have almost rid the Rural Grounds of moles, though there is particularly good shelter nearby. It is appalling to think of the havoc these energetic creatures can cause among rare and unique plants, and no effort is spared to secure a mole when traces of his presence are noted. Tar, kerosene oil and other disagreeable or sticky substances placed in the runs will disgust moles so that they are not likely to pass again, but chemicals are of little value as a permanent remedy.

SEED SOWING MADE EASY.—A Kansas man has invented a method of sowing small seeds with perfect accuracy by enclosing them at regular intervals in a little string of twisted tissue paper. The string is planted by a small drill with a reel, which makes a furrow of the proper depth, lays the string and covers it up. He claims that the tissue paper holds moisture and makes the seeds sprout quickly, while they can be planted in a perfectly straight line and with great ease in windy weather. Little time is consumed in planting, and much is saved in the subsequent thinning out, from the regularity with which the seeds are deposited. The adoption of such a method would certainly necessitate the use of good fresh seeds, or the resulting stand might be pretty thin.

THE ERYNGIUM, OR SEA HOLLY.—One of the oddest of all garden plants is the sea holly. It looks very much like a thistle, but belongs to the Umbelliferæ or Parsnip family. There are many species found in mountain regions in the north temperate zone. Most of them are hardy perennials, and have rigid spiny stems and foliage, usually steel blue or metallic purple in color. They are very ornamental, and excite much curiosity. The flower heads look like a metallic teasel or thistle, though the minute petals are usually white. Fig. 255 represents a small branch of Eryngium amethystinum, one of the handsomest and most manageable species. It makes a branching plant two or three feet high, and keeps in good condition throughout the growing season, which is more than can be said of many herbaceous plants. Sea hollies are best grown from seeds, as they do not propagate well by division, and should be placed rather in the background than in the frequently cultivated border among bright-hued plants. W. V. F.

Farming in Connecticut.

The recent articles by S. Marvin on farming in western Connecticut have started many questions from readers, some of which are answered below:

Was the grass mentioned on page 563 the heaviest you had?

No. I had heavier grass which was cut the last week in June. The seeding was two years old, and was heavily topdressed this last Winter.

Are the farms well kept up?

As a rule they are not. There are many poor fences, poor roads and bushes; in fact, much of this country is slowly but surely going back to the wilderness. Our people have but little time to keep up lawns and flower gardens, as it takes hard work the whole year around to keep things up square.

Did you use manure on the potatoes which preceded the grass?

Yes, they were manured heavily. This manure was plowed under deep, and the ground was fitted in a thorough manner, so that the potatoes had a good start and good culture.

Do you grow much grain?

Very little—usually not over four to six acres of corn. Our soil is hard to plow, and is better grass land. We raise grain in the potato field.

How can that be?

We plan to raise potatoes enough to provide for our own use, and also buy our Winter's feed. In order to produce our own grain we would have to plow up the entire farm, but three acres of potatoes in a good season will do it. We plan to ship a carload of potatoes in the Fall and get in exchange for it 15 or 20 tons of feed. Thus the potatoes feed the cows.

Fighting the Squash Insects.

The use of insecticides has become so indispensable to the garden, the orchard and the field that after 30 years of experience in their application I am prompted to a suggestion or two. For the protection of squashes, of which I have now nearly 30 varieties, constant vigilance is absolutely essential. The best remedy for the attack of the striped bug is a loose covering of mosquito netting during the short period of their siege. When growth requires the removal of this covering the squash bug or beetle continues its depredations, and for this Bordeaux Mixture is a specific and a permanent remedy. It is harmless to plant life, nor is it destructive to insect life. Its efficiency lies in making the plant offensive, thus warding off its enemies. The borer appears later, and is the most insidious and therefore dangerous of all. Its presence is generally discovered by the collapse of the running vine. As given in your issue of August 3, bisulphide of carbon is a specific for this pest, if applied in time, and as there described; let me suggest a single caution, however, in its use. Three or four drops are sufficient, while a much larger quantity generally proves fatal. It is a highly diffusive as well as volatile poison. Instances might be named of the ruin of an entire crop by its excessive use. L. P. C.

Storrs, Conn.

A SEEDLING PEACH.—I send you a sample of a seedling peach. I sent you one about two years ago; you will find a picture in THE R. N.-Y. of September 2, 1899, page 623, and a description on page 626, same issue, in which you say it is slightly cling, but this year and all other years since it commenced bearing it has been freestone. The tree has stood the severe freeze of Winter of 1899 and is still healthy, except that it has not been cultivated as it should have been, and does not make the growth that it should. I will bud some this month, but the growth is rather poor, as I said before, and they may not take so well. It is a little firm yet, and the season is about two weeks late here. My peach crop is nearly a failure this year owing to the wet Spring and circulio. I may have about 200 baskets from 2,500 trees. Peaches are rotting badly this year while green, and will continue up to the time of ripening owing to the season. I picked about one peck of Amsden June, and last year had about 80 baskets. Of course it is a very bad variety to rot. J. D. S.

Geigers Mills, Pa.

R. N.-Y.—We consider this peach an acquisition. It has good color and agreeable flavor. The sample sent was, to our judgment, more of a cling than freestone.

About "Billion-Dollar" Grass.

The crop of one square yard weighed 10 pounds, cut when dew free; this an average plot from two acres. As hay it was hauled to the barn in 9½ wagon loads of over a ton to the load. It was sown May 23, harvested July 22; average height six feet. The ground was disked, seed sown and harrowed in—all in eight hours by one man and two-horse team. The grass was cut in three hours and hauled in by three men and one team in 12 hours. It got one fair rain in May—no rain yet, August 5, so the second crop is a failure. It takes the best Ohio River bottom land and warm weather to grow it. On poor sandy soil with me it was a perfect failure. Common millet grew two to three feet high; the grass did not even sprout. "Hope Farmer," how would you like to have such land and such grass, when corn is a failure and potatoes and apples join company to make the farmer look blue? E. H.

Parkersburg, W. Va.

R. N.-Y.—We could stand any amount of it this year.

HAY CAPS.—I should say that even half a hundred hay caps on Hope Farm would do you lots of good. I have used mine this year more than usual, and they not only save hay, but enabled me to get through more than one Sabbath with real peace of mind when valuable clover lay protected under them, and the rain fell on top. Hope Farm Notes

THE OLD ORCHARD.—I have mentioned an apple orchard which stands back of the large barn. Some of the trees are, I judge, 50 years old. They are what I call "spool grafted." That is, the graft was set in the main stem, and stock and graft have not grown evenly. There are great bunches and drums on the stems and the trees are headed up in the air so that they have grown into ungainly looking things. Two of them are shown at Fig. 254. When we bought the farm I wanted to cut these old veterans out, but the Madame said "No" as forcibly as she could. She believes in giving things a chance to show their virtues if they have any. We Fall-plowed around these old trees two years ago, put on a good coat of manure and grew a fair crop of rape, Kaffir corn, sorghum, etc., last year. This Spring we seeded to oats with Orchard grass and clover and gave the trees a fair pruning. We cut oat hay enough to feed all our stock about 40 days, and have already sold over $100 worth of apples, gross, while there is a fine crop of clover and grass coming on. We can't find any fault with that. That's part of what you get by heeding your wife's advice!

PLANS WORKING OUT.—The apples mentioned above are all early varieties, mostly Nyack Pippins and "Sweet Boughs." We have picked up and shipped to New York 37 barrels of windfalls which sold for $50.50. With freight and commission out they netted us a trifle over $1 a barrel. This fruit was all more or less bruised, though we sorted out the best for shipment. Of the hand-picked fruit 146 baskets sold at retail for $50.64. There are a few more barrels yet to pick, and we have had at least 30 barrels for hog feed. If I had gone at it earlier we could have shipped 20 barrels more, but I was a little dull in comprehending what the great shortage of fruit means. In former years even the hogs have been inclined to turn up their noses at windfalls.. This year humans are calling for them. The only point I want to make about this orchard is the fact that it shows progress of the first one of our farm plans. I started two years ago to make that orchard more productive, and it is gratifying to see the results write "O. K." on the plans. If I could have sprayed the orchard thoroughly last Spring I think the returns would have been better yet. I know, of course, that this is not a fair year and that I cannot expect such prices every season. Still, I know that the orchard is all right, if I do my part. That's all we need to do with many other neglected things.

SEEDING ORCHARDS.—I have the following question from a friend in Pennsylvania:

> We desire to seed to grass our apple orchard of 10 acres. What kind and quantity of grass seed would you advise us to sow to the acre? Also time to sow, quantity of fertilizer, etc. This orchard has been cultivated eight times or more from early Spring to July for the past eight years, and from the remarkable wood growth we think a rest by seeding to grass, mowing same as mulch, would be beneficial.

I like a mixture of Orchard grass and Red clover for such seeding. With me this combination has been very useful. I seeded in the Spring, but this year I shall sow the grass seed in the Fall. We have an orchard which has, I believe, made growth enough for the present. I shall have it plowed early in September and thoroughly fitted. We shall then sow 2½ bushels of Orchard grass seed per acre. This is an expensive seeding, but I think it pays. The seed is fine and light, and the grass is likely to grow into little clumps or tufts unless put on thick. Next Spring I shall put on eight quarts of clover seed per acre. If we have manure enough left I shall put it on the orchard before plowing—if not about 300 pounds per acre of a fertilizer containing about 2½ per cent of nitrogen, eight of phosphoric acid and seven of potash. I prefer Orchard grass to Timothy because the former does better in the shade, ripens early and is, all in all, better for orchard conditions.

OATS AND SMUT.—The following question from Virginia demands attention:

> There is a great quantity of smut in the oats here this year, both in the Winter and Spring sown. I wish the Hope Farm man would tell us just how he treats his seed to prevent it. A. R. L.

It will seem strange to northern men to speak of sowing oats in the Fall, yet in the South the turf or Winter oats are put in like our rye or wheat. We use formalin or formaldehyde (both the same) on the seed oats. A place on the barn floor is swept clean and the oats are spread out about six inches deep. Half a pint of the formaldehyde is dissolved in 60 quarts of water. Stir it up well. This will give 15 bushels of oats a good wetting. We sprinkle it on with a watering pot. After the oats are wet on top, we shovel them over rapidly for about five minutes, so as to get the water all through them. Then the oats are shoveled into a pile and covered for an hour and a half with a blanket or fertilizer sacks. Then they are spread out, so that they will dry as quickly as possible. We like to do this just before sowing. The germ or spore of the oat smut is killed by the gas arising from the formaldehyde. The water carries it to every part of the pile of oats. This is our way. We like it because it kills the smut.

POTATO NOTES.—If potato vines were salable this year I could cut a good slice out of the mortgage. The growth above ground has been excellent and, strange to say, there has been little if any blight. The tubers, however, are very disappointing. There are many of them, but so small that, as yet, they are scarcely worth digging. The vines of the Junior Pride were about dead by August 15, nearly two weeks later than last year, but they have made few large potatoes. The June Eatings are still growing, but have as yet set only few poor little tubers. I find quite a good many vines this year rooting at the joints like squash vines. We find tiny tubers nosing down into the soil where the stem has been beaten and partly covered by the rain. It looks as if the fertilizer which we applied shortly after July 4 is going to increase the crop, but September will have to tell the story. It looks now as though the potato field will eat up the returns from the old orchard, and then growl for more. Still $4 a barrel counts up fast and gives size to the little ones!

NELLIE SOBERS DOWN.—Last year I had much to say about the behavior of our driving mare Nellie Bly. She ran away, shied at bicycles and "got gay" on all occasions. The Madame wouldn't drive her and Nellie became quite a black sheep of the barn. Now that her daughter has appeared upon the scene, Nellie has become highly respectable. She goes steadily and swiftly about her business, merely sniffs at a railroad train and barely winks at a bicycle. The Madame drives her all about and takes pleasure in her society. What's come over Nellie Bly? She may be ashamed to cut up such pranks before her daughter! Men and women before now have sobered down and "quit fooling" when brought face to face with the responsibilities that belong to parentage. It's just as likely that old Major gave his barn mate a bit of advice. One can imagine the old fellow wagging his wise head as he says: "See here, old girl—don't make a fool of yourself—it don't pay. These folks want to use you well. When you get into the harness you go where you are directed. It's all against their interests to take you where you are going to get hurt. Quit dancing and jumping and behave yourself, or the first you know they will let you go and separate you from your colt. Look at me. I'm as stiff as a bone, but I do just what they tell me, and they know I would take a blind man safely to church. I won't be thrown out upon any cold world—or hot one either! I'll end my days right in this comfortable barn. So will you—if you behave yourself!" That's pretty sound advice and I hope she'll take it.

ALL SORTS.—My reasons for not taking a cigar seem to have stirred up a great discussion. I am getting letters from all sorts and sides. There seem to be three questions over which the best and bravest are ready to struggle—religion, politics and tobacco! I'm a man of peace, and when some fellow with a barb sticking in him gives me a piece of his mind, I try to reason that I ought not to take it because the fact that he throws it so hard is pretty good evidence that he hasn't mind enough to make it wise for him to give it away. It does me good to find that there are lots of people in this world who believe as I do about tobacco. It is fine stuff for killing insects and infants! . . . . The feed question will be a knotty one this Winter. Oats and corn are both short in the West, and this will mean a higher price for "horse feed," which many of our farmers buy. Wheat bran, too, is going up in price, which is all wrong in theory and fact, since the wheat crop is reported heavy. A friend of mine who is supposed to be very wise says that our export trade in corn has increased so fast that the surplus will soon be disposed of, and dealers will have to charge more. Our export trade is all very well in its way, but there will be a little tremble in the hurrah for "expansion" when some of our farmers get their bills for grain. . . . If grain prices keep rising in this way, I predict that many of our Eastern farmers will be forced to produce rather than buy. While I hope to work my farm into fruit, rather than pay extortionate prices for grain, I will raise more corn on the back fields and work until I get Alfalfa started. . . . The days are growing short. We have had so little real sunshine this year that when we did have a few bright days in August we were surprised to see the sun climbing the hill long before we were ready. Well, it's not so bad for the young folks, for a year chopped off the stick doesn't make so much difference, when there is a big surplus of life ahead. It's a little dark for the fellow with gray hairs though, for we haven't had full measure of pleasure and profit out of this hard season. Haven't, eh? Why not? Figure again and see about that. Put it all down and give your blessings a fair show. H. W. C.

NOTE FROM CANADA.—Bees that survived the Winter have been doing well, much better than last year, and prospect for the remainder of the season is good. Basswood blossom is not yet quite available. Grain crops generally promise well. Manitoba wheat crop is reported very promising, so much so that thousands of laborers will be needed from the outside. The Canadian Pacific Railroad each season sends from the older Provinces excursion trains of laborers at low rates to assist in harvesting the crop. Some of these remain as permanent additions to the population. I grow my strawberries on the matted-row plan. Last Winter I killed a number of the plants. I think of giving additional protection to some new beds by plowing a good substantial furrow between the rows to assist in holding the snow and any covering that may be put on; taking care to provide waterways to prevent the plants from being submerged. W. O. E.

JOHN J. DILLON, Business Manager.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, AUGUST 24, 1901.

To January 1, 1902, for 25 Cents.

As before announced, we will now send THE R. N.-Y. every week for the remainder of this year for 25 cents; that is, from the date the order is received up to January 1, 1902. The orders are now coming in, but we would like to see more of them. If every old subscriber would send just one the plan would be a great success. We wish to ask you to take this matter right home to yourself. You have at least one neighbor or friend who needs the paper. See that he gets it for the remainder of this year, and he will be pretty sure to renew himself afterwards. If you can get up a club all the better. Do what you can. Keep 10 cents and send us 15 cents with each name. If you can send a club of 10, keep 15 cents for each, and send us 10 cents with each name—the 10 for $1. We ought to get 50,000 new names on this plan before October. We shall if each one takes a personal interest in it. THE R. N.-Y. is simply a farmers' coöperative institution, belonging more to you as subscribers than to those who have temporary management of its details. The more members—subscribers—it has the greater its power of usefulness to each and to all. It is this coöperation that gives it power to speak in behalf of farmers' interests. It is in this spirit that we appeal to you to help increase the membership at this time. Last week we sent you a convenient blank and envelope for sending one subscription. If you have not used it, please do so at once now.

*

IT is claimed that agents of the Armour Packing Company are endeavoring to secure the entire crop of western apples. The Armours, according to the story, wish to secure 1,000,000 barrels of apples in Missouri, and they are said to be ready to pay $3,000,000 for them! With the present short crop there would be a big profit this year on such an outlay. But if the Armours can make a small fortune out of these apples why cannot the farmers make it instead? The chief reason is that they are not organized for business, but are acting mostly as individuals.

*

A FEW weeks ago a former resident of northern New York hitched up his team and drove, with his family, to North Carolina. This "long trek" was made in search of a new home. Through a series of misfortunes the old homestead which had carried the family name for generations passed out of the hands of our friends. It became necessary to seek a new home on a new farm. We are promised an account of this long and novel journey. We believe that it will make a strong and interesting story—appealing with strange power to the thousands who are forced to seek new homes.

*

FROM now until cold weather in many sections one will come across the wasteful practice of feeding green fodder and soiling crops in the field. It is easier, we will grant, to drive a load into the pasture, spread it around or throw it over the adjoining fence, and call the job done, but even this year feed is too scarce to waste any. It is hard work, and often unpleasant handling, to bring the heavy green food to the barn and place in the mangers, but in this way each cow gets her share, and a much larger per cent is eaten up clean, and none is soiled by the cow's tramping. The timid cow has no show in the field with her pugnacious companion, and is worried from heap to heap, or stands off a distance and goes hungry. If the cows are expecting a good meal at the barn they are more contented in the pasture. A little more time is needed to take food to the barn, but it is more satisfactory in every way.

AT last even the buyers and shippers agree that the apple crop is very short. What little there is of the fruit is sure to bring a good price. The danger now is that too many poor fruit will be put into barrels which are to sell as first class. It will be a great temptation to throw in the little stuff, but grower and buyer must resist it. Another year we may be begging the public to buy our finest fruit, with the very hogs rejecting the culls! Dishonest packing this year will do a fearful injury to the trade. The price will be high enough for all fruit this year. There will be more sin than ever in trying to swell a second into a first.

*

A BIG corporation in this city employs many workmen on the streets. These workmen are required to wear a blue and white badge on their hats. It is a good idea in many respects, but some of the workmen object to being "tagged" in this way. At noon, when these men are free, they take the badge off or turn their hats around so that it will not show. No man likes to feel that he belongs to another—that he is to receive only a percentage of the value of his labor. This is a natural feeling born in the heart of every true man. It is carried to an absurd and damaging extent, however, when a farmer, away from the farm, tries to disguise the fact that he is employed directly by nature. The true brand of the sun and the soil is a noble one, and no man need be ashamed of it.

*

IT is said that George H. Phillips, the Chicago man who so thoroughly cornered corn, and was afterward nearly cornered himself, has made this statement:

> No more corn pools for me. I knew that I was standing over a can of gunpowder all the time, and it was only by the merest chance that I escaped total annihilation. I was forced into the May pool, but I won't be forced into another. They're too risky and not at all to my liking.

Thus it would seem that those who attempt to manipulate the grain market are likely to have, occasionally, experiences not highly seasoned with unmixed happiness; and it is quite possible that the man who has enough to eat and wear, only a moderate mortgage hanging over his head, and nothing worse than mosquitoes to keep him awake nights, still has something to be thankful for.

*

SOME of the friends of the agricultural colleges are now calling upon Andrew Carnegie to help these institutions. This is the way they talk:

> If the agricultural interests of our Nation are on the decline, likewise must the other interests follow suit. Mr. Carnegie's interests have been made possible by and through the success of the agricultural interests of this Nation. What could be more in keeping with the eternal fitness of things than that Mr. Carnegie, who has received so much from the rural classes, should in turn make possible a better agricultural education by increasing the facilities at the splendid institutions already in existence?

Our advice is not likely to be asked, but we suggest that the agricultural colleges let Mr. Carnegie and his millions alone. Most of them now receive all the money that they can use in a manner really helpful to agriculture—some of them do not make the best use of what they get. There are already too many educational beggars who stand hat in hand before rich men. Let us have more independence in agriculture! If Mr. Carnegie and others like him will remove some of the conditions which make vast fortunes possible in this country he would do far more for agriculture than he ever could by erecting school buildings!

*

THERE are some men, and by long odds they are not all found on the farm, whose sole aim in life seems to be "How little can I give for the dollar I get, and how much can I possibly get for the dollar I spend?" They are always trying to get the best end of a bargain, and using to accomplish their purpose small petty means. Some of them accumulate considerable property, but they get no enjoyment out of it, and give pleasure to no one else. When you buy of them their measure or weight will always be found a little short unless you watch them. Hired help hate to work for such people, as they get long hours, poor food and no blessings. These men are despised by everyone who has dealings with them. It is twice the work for them to sell anything. No one buys a bushel of potatoes of them without measuring them before their eyes, and looking to see how many seconds were shoved in. No one wants to buy apples of them, because their aim seems to be to see how many poor quality knotty specked apples they can get into a barrel, and call them No. 1. Economy is a good thing, and trying to get a dollar's worth of goods for a dollar is all right, but one would rather have less of this world's goods and have the respect of our fellow men. The man who gives good measure, has honest goods that are No. 1 when he says they are, and pays a fair price for what he buys, can hold up his head among men. His face won't have quite so many wrinkles when he is 40, and there will not be as long a hook on his nose.

*

No more free passes will be given to employees of the Pennsylvania Railroad, orders to this effect having been issued from the head office of the company. Those working in railroad shops and living some distance away will now have to pay the regular commutation rates. Several of the larger western roads adopted this system some time ago, and a strong effort is being made to have the plan general on all roads of importance throughout the country. The companies take the ground that the granting of passes to employees is the same as extra compensation, discriminating against those who do not require them, and being contrary to business principles.

*

CASH wheat is selling in New York at 78 to 79 cents per bushel, corn bringing 63 to 64 cents, and oats 42 to 44. In order to understand just what these figures mean let us compare them with the prices in former years. The figures given are wholesale prices at about September 1:

	1896.	1897.	1898.	1899.	1900.
Wheat	67¼	102	70	73	86
Corn	26	37	35	38	49
Oats	19½	24	26	26	28

Thus it appears that there has been a steady rise in the price of corn, which has now taken a sudden jump to about the highest average figure in the past 35 years. Oats, too, have gone up in price, and the increased cost of these two cereals presents a hard problem to many farmers. During the past 10 years thousands of farmers have come to depend more and more on the cheap western corn. In some cases the cultivation of the grain has been given up or largely cut down, since there seemed to be more profit in growing the stalk for the silo, when western corn can be bought at 35 cents. Exports of corn to foreign countries are rapidly increasing. In 1891 the value of corn and cornmeal exported was $18,599,664, while last year this had increased to the enormous total of $87,354,810! The removal of this immense volume of grain (over 200,000,000 bushels) from the home market has been responsible for the present excessive price. We venture to say that this high price will hurt more farmers than it will help, so dependent have many of them become upon the western grain for feeding purposes. As a result of this year's prices we expect to see a large increase in corn growing on eastern farms, for there are farm lands in New Jersey which will produce as much corn to the acre as any soil in Kansas or Iowa. Thus the export trade in corn is likely to change the character of eastern farming.

*

BREVITIES.

READ Mr. Cook's ideas about silage on page 591.

WHO can know happiness without knowing sorrow?

TO regulate the pants of an overheated dog divest him of his coat.

CAST your ill-bred chickens upon the waters—and let them drown.

IN a season like the present what a blessing the Abundance plum is.

YOU tell some fellows to be clean, and they will scarce know what you mean.

HOW many of the farmer's wrongs can be remedied by the farmer himself? Lots of them!

THE honey bee seems to be more fully protected by the law than any other domestic animal. Why?

AN editor may offer his brains for a fair price, but his heart and conscience should be beyond purchase.

WE receive letters every week from western farmers who say that they wish to locate in New England.

WHEN a nurseryman gets in front of the San José scale and tries to hide it he deserves to be sprayed—and he will be.

SHOULD the milkman wear a white uniform? It's a good plan if he will keep it clean. A dirty white jacket is worse than a clean blue blouse and overalls.

THIS old world might be better if some men could or would get off in the woods at times alone and cry—let out their troubles and temper through their tears!

THE butter record is only one side of that dairy contest at Buffalo. The question of milk production also enters. In this the larger breeds naturally beat the smaller ones.

THE drought in the West is driving farmers to all sorts of shifts for Winter fodder. Who can give us any experience with sugar beet tops in a silo? Are they worth hauling three miles for this purpose?

WHEN some new horse bites a fraction of a second off the trotting record every horse lover feels the bite away down to his sporting blood. Every cow man ought to feel his cream at the story of the cows in that dairy test at Buffalo.

WE have a number of letters from people who conclude that they have cultivated their apple orchards until they have overdone the business. Now they want to know what grass is best for seeding. We like Red clover and Orchard grass.

AMERICANS import about 15,000,000 pounds of macaroni each year. It should all be made here, and will be when our farmers grow the special varieties of wheat from which it is made. The Department of Agriculture is trying to interest farmers in this matter.

Events of the Week.

DOMESTIC.—Judge Tuley, in Chicago, has decided the Illinois statute governing the coloring of grain to be unconstitutional. . . . . The safes of the Illinois Central Railroad and American Express Company in the station in Bollvar, Tenn., August 9, were blown open and robbed by two masked men, after the robbers had forced the night telegraph operator into a box car and locked him in. Only a small booty was secured. . . . . A large boiler exploded in a hotel at Long Beach, Long Island, August 11, crashing upward from the basement through the roof. No one was injured; loss $30,000. . . . . Fire at Rantoul, Ill., August 9, destroyed 50 buildings, causing a loss of $300,000. . . . . An outbreak of smallpox has occurred at Newark, N. J. . . . . George Bissert, the New York policeman accused of receiving bribes for protection given to lawbreakers, was sentenced August 12 to 5½ years' imprisonment and $1,000 fine. . . . . The gold stolen from the smelter at Vallejo, Cal., has been recovered by divers, having been hidden in the waters of San Francisco Bay. One suspect has been arrested. . . . . August 11, the explosion of a boiler on the steam yacht Quail, near McKeesport, Pa., injured 20 persons, two fatally. . . . . The entire business portion of Armstrong, B. C., was destroyed by fire August 11; loss $90,000. . . . . The warship Alabama is in quarantine off Nantucket, Mass,, owing to a severe epidemic of mumps among the crew. . . . . Train robbers held up a passenger train at Caney Switch, I. T., August 14, and robbed the passengers of all their valuables. Five men took part in the robbery, and held up the train two hours. . . . . Five men were burned to death, four drowned, four suffocated and several injured as the result of a fire which destroyed a temporary water-works crib in Lake Erie, two miles out in the harbor at Cleveland, O., August 14.

ADMINISTRATION.—In the case of the application of the California and Hawaiian Sugar Refining Company for the liquidation of certain drawback entries covering shipments of sugar to Guam, the Treasury Department has held that, while Guam and Tutuila remain foreign territory, so far as customs duties are concerned, they are not foreign countries within the meaning of the drawback laws, as exportations for this purpose must be made to countries without the jurisdiction of the United States. No drawback, therefore, can be allowed.

GENERAL FOREIGN NEWS.—Seven persons were drowned August 7, by the collision of the White Star liner Oceanic with the coasting vessel Kincora, off Tuskar, Ireland. . . . . A fire at Havre, France, August 11, destroyed factory property valued at $400,000. . . . . The town of Farösund, Sweden, was destroyed by fire August 13; about 1,200 people were rendered homeless, and the damage amounted to $400,000. . . . . Baron Erik Adolf Nordenskjöld, the Aretic explorer who discovered the Northeast Passage, died at Stockholm, Sweden, August 13. He was born in Finland in 1832. In 1883 he penetrated the ice barrier east of Greenland south of the polar circle, a feat which had been attempted in vain by many expeditions during 300 years.

FARM AND GARDEN.—Prof. W. J. Kennedy, of the University of Illinois, has recently been elected to succeed Prof. John A. Craig in the animal husbandry department of the Iowa Agricultural College. Prof. Kennedy is a graduate of the Iowa Agricultural College, and was elected to the animal husbandry work in the University of Illinois immediately after the completion of his course at Ames two years ago.

The National Hay Association has filed a complaint with the Interstate Commerce Commission against the present classification of hay by various railroad companies. The complaint states that up to January 1, 1900, hay and straw were classed by the railroad companies mentioned in the complaint as articles entitled to sixth-class rates. Official Classification No. 20, issued January 1, 1900, increased hay and straw to the fifth class. The increase amounted on shipments from Chicago to this city to five cents per 100 pounds, or $1 per ton of 2,000 pounds, being an advance in the rate from 25 to 30 cents per 100 pounds. The complaint alleges that such advance in hay and straw was made by the railroads to obtain additional revenues, and not because of any impropriety of the long existing classification of hay and straw as sixth-class freight. It further alleges that freight rates on hay and straw from points in Canada favor the foreign hay to such an extent as to compensate the foreign farmer and dealer for a large part of the customs duty, amounting in many instances, it is alleged, to three-fourths the duty, which is $4 per ton. This alleged preference by the railroads to foreign hay enables the foreign product to compete successfully with American hay in New England, in this city and on Long Island. The Treasury Department reported that during the whole year of 1899, before hay had been changed to fifth class, only 19,872 tons of hay, valued at $115,409, were brought into the United States from Canada. During the nine months ending September, 1900, 127,694 tons of Canadian hay, valued at almost $1,000,000, were shipped to the United States.

The heavy rain and wind storm that passed over sections of Cortland County, N. Y., August 7, did heavy damage to crops, particularly corn. In many places entire fields were leveled to the ground and the damage will amount to thousands of dollars.

The Eastern New York Horticultural Society asks its members and friends for fruit to be exhibited at the State Fair, Syracuse, N. Y., September 9-14. Early varieties should be placed in cold storage and shipped with other varieties by express not later than September 4, to E. N. Y. Horticultural Society, State Fair Grounds, Syracuse, N. Y.

The American Shropshire Registry Association offers a number of special premiums at Fall and Winter fairs; schedules may be obtained from Mortimer Levering, secretary, La Fayette, Ind.

The Society of American Florists, in annual convention at Buffalo, N. Y., August 6-9, elected John Burton, Philadelphia, Pa., as president for the ensuing year; vice-president, J. W. C. Deake, Asheville, N. C.; treasurer, H. B. Beatty, Oil City, Pa., reëlected; secretary, W. J. Stewart, Boston, Mass., reëlected. The convention will be held at Asheville, N. C., next year.

The superintendent of the free rural mail delivery is making arrangements to have weather forecasts promptly delivered to farmers by the rural carriers.

The National Good Roads Association will hold a congress at Buffalo, N. Y., September 16-21. The Association, in coöperation with the Illinois Central Railroad and Department of Agriculture, has just completed a very successful good roads campaign in the States of Louisiana, Mississippi, Tennessee, Kentucky and Illinois. Over 20 miles of earth, gravel and stone roads were built and several large, enthusiastic conventions held. Thousands of people flocked to see the practical work of the "good roads train" and to participate in the deliberations of these conventions.

FARM NOTES FROM INDIANA.

IS TIMOTHY DEAD?—I was passing a neighbor's farm lately and noticed a narrow strip plowed by itself. He said that he unfortunately or carelessly sowed some English plantain there a few years ago in finishing up some clover, and that it had been a great curse. He had kept it all out of the patch when tending it in corn, but it sprang up in the wheat that followed. The next Spring he went over the clover carefully and gouged out every stool that he could see, but it came in his clover the next year. Now he is plowing it after wheat to kill clover and all. He asked how he should know whether his Timothy sown in wheat this year is dead or not, as if it is, he wants to break the land. The drought here has been so severe that it has cut the corn crop in half and the young Timothy seems to be dead. I said that it is hard to tell whether it is dead or not, and since the field is near water I would throw a bucket full of water on each of three places once a day for three days and watch a little. If there is life it will show itself.

BLIGHTED CORN.—The corn crop is very spotted. Local showers kept places from total destruction. It does not seem to be wholly dryness that has hurt the crop. The ground is not so dry as it sometimes is. It is the extreme heat that damaged it. The crop is damaged where it is not fired at all. It is also peculiar that in the early-planted corn the extreme heat at time of tasseling killed either the pollen or the silk so that in very many well-appearing ears not one grain in 10 is filling. This is very strange for this section, and I had to examine for myself before I could believe that it was in any way general. It is, however, only in very early-planted fields that this occurs. Many stalks scattered about the fields have white tassels. These were killed by the hot sun. It was first noticed on the hottest day recorded in this State. The Government thermometer reached 106 in the shade. Ever since that day until it turned cooler lately, a period of near a month of hot weather, these blighted tassels have continued to appear. In many fields they now number one in 50. There has been much discussion as to whether a stalk so blighted will bear an ear. An examination seems to show that they will bear as well as others around them. This is, however, strenuously denied. I examined many of them to-day in different fields, on high and low land, and find them shooting as well as stalks around them, and that they have been fertilized by stalks near them, so that the grain is as well filled as that on ears nearby. Of course, there are many of them as with other stalks that will not shoot at all. One excellent farmer says that if the tassel blighted before the shoot started, there will be no ear. I do not think that rule holds good.

POOR CULTURE.—In passing through corn this morning some of it appeared drooping and severely tried, and it was very common to find half of the stalks not shooting at all. Our people are talking dollar corn, which is, of course, an impossibility in the general market. We have stirred all our high ground corn with a Planet Jr., and the effect is good as shown by check rows left with a crust. When on the road lately I have seen many fields of wilted corn which appeared ruined and had a hard crust on the soil made by a shower near harvest. The owner did not know that that hard soil was giving to the air from 10 to 20 tons of water a day per acre, and that a fine mulch three inches deep would stop nearly all of this loss of moisture. Still, the careful farmer could not avoid the extreme heat of the sun this year. But I noticed this morning in passing through a swamp that I had ditched and planted to corn that this corn was as green and perfect as though it had not seen hot weather. It reached down to water. This is conclusive evidence that the damage is far greater on account of drought. If moisture is plentiful the evaporation from the corn blades cools them so much that the excessive heat is not injurious. In fact it is a rule all the time that good tillage conserves moisture and helps the growing crop. During the last month of great drought farmers have been in such doubt as to the outcome of the corn crop that it has been difficult to sell corn harvesting machinery to them. They did not know whether there would be enough fodder to be worth cutting. Now they see that though many fields have almost no grain yet the fodder is worth saving, and now it is often said that with the high price of grain one must cut and save all his roughness.

CALVES GOOD.—Last week I bought 24 calves at the yards. They weighed 391 pounds and were in good order. They were from a Short-horn herd and had had all the milk they wanted. They were a dark red color and straight on backs and bellies. Said to be the finest lot of that number that had been in the yards for months. They cost $4.40. This is a good price. I have, however, had parties offer to take them off my hands since getting home. Lots of calves are selling at four cents. Some one criticised me for buying anything when corn is now 70 cents in the market at the city. But these calves will Winter on silage and shredded fodder with little grain, and will pass next Summer on grass and one more Winter on coarse feed. This will let one crop pass in the future to straighten things up before these calves will take much grain feed. I have lots of roughness and want something to eat it.

STOCK OUTLOOK.—Three months ago everyone was hunting shotes at five to six cents. A sow and pigs sold at fabulous prices. Now the trouble is to find a place for shotes. It is quite possible that it would be a blessing if every pig one has would die before morning, unless it be enough to pick up waste or follow cattle. Seldom have I seen so many violent changes in the lines of agriculture as in the last year. Our export trade has become so enormous that it is difficult to supply it. The supply of cattle, hogs and sheep at Chicago for last July was the largest ever known, and prices held up and even advanced. Chicago packers are taking everything they can afford to buy and have agents elsewhere shipping to them. It seems that the great commercial throat can never be satisfied. The man is lucky to-day who has a lot of stuff about fed out, and he is also happy who has lots of pasture and roughness.

Indiana. E. H. C.

Government Weekly Report.

Rain has fallen in a large part of the drought-stricken section, but dry weather still continues in the Ohio Valley, Tennessee, and the upper lake region. Heavy rains have caused damage in the Carolinas, Georgia, Florida and Alabama. On account of extreme heat in the interior of California, fruit is ripening too rapidly, and injury to grapes is reported. Late corn has greatly improved, and with fairly favorable weather during earing time, the yield in the Missouri Valley and Atlantic coast districts will be larger than previously estimated. In the central and eastern portions of the cotton belt more favorable conditions are reported. In the western part cotton needs rain. Picking is in progress in southern Texas. Tobacco is looking well except in Maryland, where there has been too much rain. A slight improvefent in the apple outlook is noted in the Ozark region.

Crop Prospects.

The wheat crop of France, which is just harvested, is thought to be about 56,000,000 bushels short of the actual needs of that country. French buyers anticipate getting 20,000,000 bushels from the United States, if prices do not rise above those asked for Russian grain.

AUGUST 4.—Manitoba, our prairie Province, to the north of Minnesota and North Dakota, announces a bumper crop of wheat, a crop so large that the harvesting of it is a cause of anxiety; 20,000 laborers are advertised for to assist. To these the railways offer as an inducement exceedingly low fares. Grain in this section of Ontario has been damaged by heavy falls of rain that have beaten it flat, causing it to sprout to some extent and, of course, making it more difficult to harvest. Root crops and corn are doing finely. Winter apples almost a failure; Fall apples a moderate crop. Asparagus so far shows only a little rust here and there. Strawberries and raspberries only half a crop. W. O. E.

Ontario, Canada.

AUGUST 10.—An extensive pear grower in Monmouth County, N. J., writes us that the crop is very light, LeConte a total failure, Kieffer very scattering, some orchards extremely light, others a few on each tree.

New York. S. H. & E. H. FROST.

AUGUST 12.—Oats rusted badly with us and are very light. Wheat and barley have been damaged by Hessian fly, and there are very few good pieces of either. Some fields of Dawson Golden Chaff wheat that seemed to promise large yields and were not hurt by the fly, on thrashing turn out to be a poor sample and yield only 18 to 23 bushels per acre. Cabbage is growing well, but the appearance of stump rot in some fields is causing much apprehension. R.

Ontario Co., N. Y.

AUGUST 12.—The apple crop gets less every day, especially Winter sorts. There has been a great amount of rain of late. Pastures are very fine, but preparation for seeding is kept back by the rains. Corn is growing fast, but is very late. Bartlett pears only about one-tenth of an average. Wheat is badly damaged by growing in the shocks. Oats are a failure, so far as grain is concerned. Potatoes are very late. Tomato crop is late and a very light set—lack of sunshine and excessive moisture is supposed to be the cause. I. J. B.

New Jersey.

FRUIT IN MISSOURI.—The collection of the fruit crop report for July from all parts of the State shows, at this date, a universal injury to the apple and peach orchards by the prolonged drought of nearly 90 days. The apple trees show considerable injury, especially where heavily loaded with apples. The excessive drain upon the trees will be a serious one unless rain comes soon, or the trees are thinned of their fruit. We find some are now taking off one-half of the apples from the trees, and it is surely the safe plan to follow. Orchards that have been well cultivated are certainly holding their fruit best, and this is the general report for both apple and peach. There never was a year when both the apples and peaches were so smooth and free from all insects and fungus diseases. The fruit is rather smaller than usual and later also. We find apples sunburned, too, in many places, especially where trees are so heavily loaded that the fruit is exposed to the direct rays of the sun. Some of this will never ripen and some will never grow to full size. The per cent of the apple crop has fallen from 85 per cent in May to less than 40 per cent for the State at this time. Some portions in the southern part report as high as 75 per cent still, while others report as low as 10 per cent. It is strange that the district most seriously affected is along the Missouri River hills, but the drought has been more severe there. The southern part of the State will have the best crop and the northwestern will come in a close second. Other orchards scattered over the State will have fine crops also. The peach trees have not been injured as much as the apple, but some of the fruit has suffered worse, hence the less supply. While many of our apple trees will die from the drought, yet I believe we shall not lose many of the peach trees. It will be well, however, to take off at least one-half of the peaches if we expect to get good-sized fruit, and relieve the trees. All trees well cultivated are reported in best condition. L. A. GOODMAN.

Secretary Missouri Horticultural Society.

Woman and Home

From Day to Day.

A CHEERFUL BROTHER.

Springtime finds me happy, Summer makes me sing;
Falltime is so glorious, I hear the joy bells ring!
Winter—I jest love it, with fires blazin' free;
Every blessed season is packed with sweets fer me!

Great old world, I tell you; don't care what they say,
With the frosts of Winter, with the flowers of May.
Ain't it doin' splendid? Anyone can see
Every cup is brimmin' with joy fer you an' me!

Great old world in darkness—great old world in day;
Reap its happy harvests, walk its happy way!
Lots more light than shadow—light a-fallin' free,
An' all the bloom an' beauty an' light fer you an' me!
—F. L. Stanton in Atlanta Constitution.

*

ODD little needle books recently seen were in the form of square soda crackers, made of silk, with realistic pinpricks, opening to show flannel leaves. The same shape has been a popular one in scent sachets.

*

NEW flannel waists for Fall wear show the buttoned back almost entirely. The effect is pretty, and it permits effects in trimming impossible otherwise. If well fitting, however, it is quite impossible for a woman to get into one of these without assistance, since they are harder to button than the thin wash waists. Very brilliant colors are seen in the flannel waists, and the old hunter's green is to be a favorite, under the new name of chasseur. National blue, golf red, myrtle and Nile green are standard shades.

*

WHITE Panama in a masculine shape is this season's contribution to the outing hats. They are still rather uncommon, but decidedly fashionable; smaller than the men's hats, but following their general outlines. The only trimming is a velvet band 1½ inch wide, sometimes with a little knot or rosette and occasionally with a single quill passing through it. As a rule, the band is black; sometimes, however, it is moss green or dark blue. The effect of the dark velvet on the white Panama is very striking.

*

A HOMELY philosopher observes that when a merchant is injured by the competition of a rival, he doesn't pull down the blinds and sulk; he puts some new attraction in the window, and there is a very large moral in this rule of business. The girl or woman who, in the face of social disappointments, or even greater sorrows, pulls down the blinds, and advertises her griefs and cares, is not only adding to the burdens of an overworked world, but is making herself less able to bear the everyday trials that come to all.

*

JUDGING from the display made already, the coming season is to be one of plumes and made feathers. Fall hats, both of straw and felt, often have two long plumes or breasts encircling them, next in preference to this being a big feather pompon. Large round black hats have two long white plumes around the crown, quite near the edge of the brim, with a black velvet knot in the center. Combinations of black and white lead in the midseason millinery. It is possible now to buy liquid hat dyes, for the renovation of straw hats; the dye, which may be obtained in various colors, is applied with a small brush. It is a decided improvement over shoe polish, which used to be our resource when black straw hats grew dull and dusty.

*

ICE cream sandwiches form a new dessert. A slice of well-frozen cream is placed between two wafers, the sandwich wrapped in parchment paper, and put back in the freezer until needed. Perhaps the caterer is indebted to the street vender of similar delicacies for the idea. There is a sidewalk fruit stand near THE R. N.-Y. where, for the sum of two cents, the wayfarer may be supplied with a frosty slab of ice cream, very aniline as to complexion, laid between two little wafers. The reason for supplying ice cream in this way is its economy; it does away with the necessity for dishes. Spoons are always a superfluity to the street vender and his customer.

3882 Woman's Fancy Blouse, 32 to 40 bust.

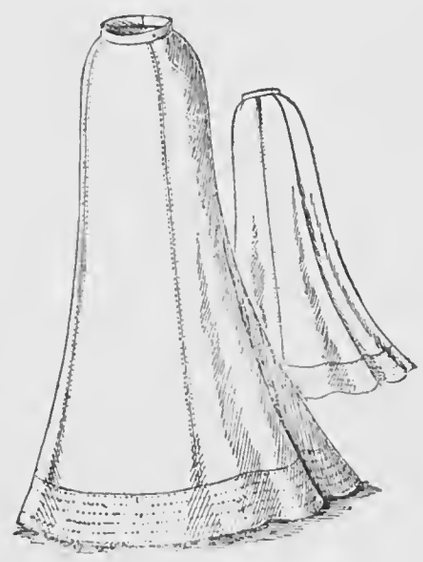
*

ONE of the saddest examples of wasted effort in the world is the woman who has expended hours and hours every year in curling her hair with crimpers and kid rollers and heated irons, and all the other mysterious implements of torture designed to that end, only to discover, in a moment of despair, that she looks better in every way when her silken locks are allowed to remain straight. It is one of life's mysteries that so many boys, to whom curls are a matter of derision, should inherit a topknot full of waves and crinkles, while their suffering sisters may wear a chevelure with about as much natural curl as a piece of telegraph wire. Fortune's gifts are distributed very unevenly; as one ungrammatical philosopher says, "them that has gits."

The Rural Patterns.

The blouse shown with sailor collar has a foundation, or fitted lining, closing at the center front. On it are arranged the various parts of the blouse proper, which closes at the left side beneath the box pleat. The center front is tucked in groups for a short distance, then allowed to fall free and form soft folds. The fronts proper are laid in one box pleat at each front edge, but otherwise are plain. The sailor collar is attached to the blouse, and the shield is arranged over the lining. The sleeves are in bishop style. When the lining is omitted the shield is attached to the waist beneath the collar, permanently to the right and buttoned to the left; and the waist is either gathered at the waist line or adjusted by means of tapes run through a casing. Otherwise there is no difference in the making. To cut this blouse for a woman of medium size, 4½ yards of material 21 inches wide, 3¾ yards 27 inches wide, three yards 32 inches wide, or 2½ yards 44 inches wide, will be required, with ⅜ yard of all-over lace. The pattern No. 3882 is cut in sizes for a 32, 34, 36, 38 and 40-inch bust measure; price 10 cents from this office.

The five-gored skirt has the great advantage of never going out of style. Slight variations there may be and details may require to be changed, but the general cut remains. The model illustrated is made with stitched seams and includes the latest novelty in the band flounce that completes the lower edge. The original is of gray satin-faced cloth, but all skirt materials are suitable, cheviot, serge, homespun and similar woolen fabrics as well as the heavy ducks and linens that are made on tailored lines. The front gore is narrow and gives the desired tapering effect to the figure. The wider side gores are smoothly fitted with hip darts and the fullness at the back is laid in an inverted pleat. The flounce is finished with rows of machine stitching. To cut this skirt for a woman of medium size eight yards of material 32 inches wide, 5¼ yards 44 inches wide or five yards 50 inches wide will be required. The pattern No. 3788 is cut in sizes for a 22, 24, 26, 28, 30 and 32-inch waist measure; price 10 cents from this office.



3788 Five-gored Skirt. 22 to 32 in. waist

A Busy Life.

The Cornell Reading Course for Farmers' Wives gives the story of one busy farmer's wife which doubtless could be duplicated, in all essentials, by many others. Says the heroine of this useful life:

"Two things I have been taught in my long farm life: one is, that work never kills, and the other is, that we must calculate work beforehand in order to save steps and do a great amount of work. I am 58 years old. Have been on a farm all my life until a year ago, when we built a new house on one end of our farm which opens on a public road and retired from farm labor. My father was a farmer and a minister of the old school, who believed in no salary, but believed in working for a living. I learned to milk when seven years old, and always did my share while at home. I was sent to school, but at 14 commenced to teach a district school on a third grade license. I soon reveived a second and then the first grade. I boarded around. I was married at 19, and then my farm life began in earnest. We always kept a dairy, from 12 to 14 head. When we were married we did not own a foot of land. My husband and I bought 30 acres the day after we were married, joining the old homestead of his people, with whom we lived. They owned 50 acres, but there was a mortgage of $350 on that. We took care of them until they died, paid the mortgage, bought enough more to make us 200 acres. We had a sugar orchard and made from 300 to 500 pounds of sugar and a great deal of syrup every year. We kept sheep and always worked up the wool, spun, wove and made full cloth for men's wear and for flannel sheets. We knit our own socks and stockings. I would always rise in the morning at four or half past, Winter and Summer, and have built my own fires, milked from four to eight cows, prepared the breakfast and had it at six. Until about 10 years ago we made butter, and since then have sent it to a factory. I always did my own churning, and many are the books of poems, histories, stories and newspapers I have read through while churning.

"I am the mother of eight children, five of whom are living. The others died when small. The oldest living is 36 and the youngest is 12. Three of them have graduated from high school and been a number of terms at an academy. One has been for five years at Cornell University. I have always done my own washing and weaving of carpets, as I have a large house, and it is furnished with rag carpets. I make my own garden and have helped rake hay and husk corn. One Fall, alone, I husked between 500 and 600 bushels. I had one daughter and she was at home at that time; so I did no housework while husking, although I attended to the milk and butter, milked, and got breakfast. One Summer I piled up 100 cords of wood and did my own housework. You will say there was no call for this. We were married the first year of the Civil War. In 1863 my husband was drafted, paid his $300 and stayed at home. That had to be met in hard times for the farmer. Not many modern wives would think they could pull flax, cut corn, dig potatoes, and do all things on a farm that we used to do. All this time I had a hired girl only a year and a half. We made our own table linen and toweling, spinning and weaving it, and our flannel dresses. I have been with the sick a great deal, and always went to church and Sunday school, and attended societies which belonged to the church. To-day I can walk a mile or more as quickly as anyone. At the present time I have two old people to care for; one of them is 86 and the other is 83. There are five in our family, and I am doing all the work myself, and am going to take the teacher to board next year. So you see, work does not kill, and there must have been some calculation to save steps. My husband says, 'You helped earn and saved more than I did.' The boys many times say. 'If it had not been for your pushing and helping us to school, we never could have done so well.' All this time I have kept up with the general reading of the day. I never counted my steps but once, and that was when I spun a skein of woolen yarn. I went a little over a mile."

As I know more of mankind I expect less of them, and am ready to call a man a good man upon easier terms than I was formerly.—Johnson.

DISTANCE sometimes endears friendship, and absence sweeteneth it—for separation from those we love shows us, by the loss, their real value and dearness to us.—Howell.

Sow Pansy Seed Now, Don't Put it Off.

His Wife and His Horse.

"Yes, I should say Jason had made a sensible choice. She looks strong and well, and will prove willing and patient and kind, I feel pretty sure. She doesn't look as if she was afraid of hard work or would shirk or complain much."

It was Mr. Fifield who thus summed up, at the breakfast table, the general impression made by a young woman the family had met for the first time the evening before, the newly arrived bride of the young farmer whose orchards joined theirs. Mrs. Fifield acquiesced. Lottie had already declared that she liked the new neighbor. Tommie had said she was not very pretty, and Ned, who was beginning to think he knew many things, had demurred at her "big mouth" and decided that she laughed too much. Little Bess, on the strength of some petting and a promise received the night before, devoted herself to her oatmeal after announcing that she should go to see Mrs. Jason every day, specially baking days. The child loved to cut cookies and make saucer pies, but received little sympathy in the home pantry. Only Fannie had remained silent. No one had noticed this and Mr. Fifield looked up surprised when, in response to his summary of the new wife's virtues she protested:

"Father! One would think you were discussing a new horse he had bought!"

Mr. Fifield regarded his daughter a moment, then he pushed back his chair, for he had finished his coffee some time before, and abandoned further discussion by going to the barn.

"Now you needn't look severe, I was not disrespectful," Fannie began in self-defence when the door was closed upon her father, and Bess and the boys had run off to feed the menagerie in the back shed. "I had to speak or choke. It makes me out of all patience. She is well enough, and I don't object to her, if Jason is satisfied. But she does appear as wooden as a clotheshorse and about as interesting as a cow. I don't say she isn't a good and useful person, but the idea of praising and lauding her to the skies as if brains were of no more consequence in a woman than in an ox, if only she be willing and able to work."

"I shouldn't wonder if she had been to school as many terms as we have," Lottie's slow even tones replied, "I'm sure we are not so remarkable ourselves that we have much excuse for looking down on other people."

Fannie's cheeks grew redder, and she turned about to escape the patient protest in her mother's eyes. "Oh you don't understand!" she cried. "It isn't what I am myself. I am miles and miles short of being what I like and admire, but I am not going to be carried away with admiration of a person who knows less than I do, and who probably hasn't an idea of anything but what she has realized in herself."

Lottie laid down the knives and forks she had been gathering up. "Now, Fan!" she said with decision, "if you are going to sail off into one of your moods of airs and high notions you shall work alone. If we talk we shall quarrel and get unhappy, and I prefer to keep quiet and enjoy myself. I think Cousin Emma and Aunt Sarah will be over this afternoon, and I mean to try a new kind of cake for tea. You may do the work here or upstairs as you prefer."

It is perhaps not necessary to record in what manner Fannie closed the door. She chose to set the sleeping rooms in order, and did an astonishing amount of dusting and sweeping during the morning. Girls of a certain type have many moods and notions to work off. No doubt the vigorous physical exercise assisted Fannie's return to placidity. At noon, when Bess discovered how exceedingly fresh and pretty the front rooms were looking, and ran off to call the mother and Lottie to come and see Fannie's beautiful bouquets and how nicely she had rearranged the parlor chairs, Fannie was once more serene and smiling. Later, when Sarah Fifield and Emma had duly appeared, and the five sat with their needlework discussing whatever lay uppermost in family interests, Fannie gave the visitors an amusing and perfectly fair synopsis of the verdict upon the new neighbor, not omitting her own naughty temper.

"I am not sure but men do choose their wives much as they do their horses," mused Sarah Fifield after Fannie's story was ended.

"You know, do you not, Aunt Janet, what helped your Clara to decide that she liked and trusted Theron Huntoon?" asked Emma, addressing Mrs. Fifield. "I did not know but she told you," Emma went on, seeing that no one knew to what she referred. "It made quite an impression on my mind. Maybe I should never have decided to marry Jack if I had not had that to help me say yes. Clara said she wasn't sure what she did think of Mr. Huntoon till one day he took her and Miss Peck off for a long drive. He had a hired horse, and she said she liked the way he treated it. He made it keep a comfortably good pace, but he was considerate and droll, too, and when it acted foolishly about a hand cart of some sort he encouraged it intelligently and showed patience and understanding. Clara said she had long had a theory that a man treated his wife as he did his horse, and she began from that day to appreciate and trust Mr. Huntoon."

"Mr. Harris whips his horses just dreadful," remarked little Bess from the door sill, where she sat endeavoring to

3838 Chemise Nightgown 32, 36 and 40 in. bust.

2987 Woman's Empire Nightgown 32 to 40 bust

put her dolly's dress on to the gray kitten.

"And his wife threatens to go home to her mother," Lottie added, laughing.

"When a man is in love and knows he is on trial I fear there isn't much dependence to be placed on his apparent amiability," remarked Sarah Fifield. "Maybe this Mr. Harris was good natured when he took his wife out to ride before they were married. And I cannot think that the young men who drive horses so cruelly are really hard hearted. I think they are oftener silly and full of false notions of smartness; they make the mistake of supposing that they make a fine appearance when driving fast. But I shouldn't wonder if Clara was right in some measure. The man who twitches and frets at his horse would be likely to be impatient and ungentle with his wife, perhaps."

"The Eliots indulge their horses to the last degree," said Emma gaily. "They are unchecked when they have a load to draw, and let to drink at every wayside brook."

"Yes, they feed their animals well and give them good care, but don't you trust too much to that, Emma," said Mrs. Fifield. "There isn't a pair of horses in town that do more work in a year than those your husband drives. It was always so on that farm. Mrs. Eliot and the girls could always have a horse to drive, and Jack rides down to the village many a night when other men would think their horses must rest. Use your own judgment, child, and don't trust any man to test your capacity for work."

"Yes, Aunt Janet," said Emma solemnly, but laughed the next moment and went on merrily. "It is because they humor their horses and keep them quiet and unfretted that they can do so much. Why, look at old Peggy! Nearly 30, and sleek and hearty yet! Not one of the young horses will cultivate as much ground in a day. But I will keep an eye on Jack, since you think I ought." P. T. PRIMROSE.

A Chapter of Pickles

Pickled Peaches.—For six pounds of fruit use three pounds of sugar and a pint of vinegar. Rub the peaches with a flannel cloth to remove the fuzz, and place in each two cloves and several small pieces of cinnamon. Put the sugar and vinegar on to cook, and when it is boiling hot drop in a few peaches and cook until they are tender, but do not allow them to lose their shape. The peaches and syrup should be put in the jars hot, and sealed. Only ripe peaches should be used for pickling, otherwise the fruit will shrivel.

Chopped Pickle.—Six large cucumbers, one peck of green tomatoes, one head of cabbage, four large onions, three large bunches of celery, four small peppers, five cents' worth of mixed white mustard and celery seed, one gallon of vinegar and one-half teacupful of grated horseradish. Sprinkle one-half teaspoonful of salt through the above vegetables after they are chopped; let remain 24 hours. Heat up in a weak vinegar at first, drain, then boil 20 minutes in the clear, strong cider vinegar. Will keep well in crocks unsealed.

East India Pickles.—Remove the seeds from six green tomatoes and two green and one red pepper; slice the tomatoes and 12 medium-sized green cucumbers, and chop the peppers and two onions fine; sprinkle with one cup of salt and let stand 24 hours. Drain the vegetables, pour two cupfuls of vinegar and one of water over them; slowly bring to a boil and drain again. Make a smooth paste with a little cold vinegar, three tablespoonfuls of sugar, one teaspoonful each of cinnamon and turmeric and one-fourth teaspoonful each of cloves and allspice; bring one pint of vinegar to a boil, add two tablespoonfuls each of chopped mint and white mustard seed, the spices, and then the vegetables; bring to a boil, cook 20 minutes, stirring constantly; pour into pint-size glass fruit jars and seal hot.

Pickled Damsons.—This is a sweet pickle, and very good served with mutton or venison. Ingredients required: Three pounds damsons, one quart of vinegar, three pounds moist sugar, one-half ounce cinnamon, three blades of mace, one-quarter ounce allspice. The plums should be ripe, but not too much so; the bloom is rubbed off with a piece of flannel or a clean cloth, and they are pricked a little with a needle. The vinegar, sugar and spices are boiled together for 10 minutes, then strained and poured over the fruit, in a large basin. Next day the vinegar is boiled again, and again poured over the damsons, and on the third day the damsons themselves are simmered in the vinegar for exactly five minutes. They should be tied down while hot. A quicker method of pickling either plums or damsons is the following: Remove the stalks from the fruit; wipe it and arrange in layers in a jar with good brown sugar sprinkled between. Fill up the jars with cold vinegar, tie them down and bake in rather a slow oven till the plums are tender, then tie down for use.

Cucumber Pickles.—Wash the cucumbers clean and place them in a stone jar. Cover with a brine made of one pint of salt to six quarts of water. The water should be boiling hot. Place grape leaves on top, weight down and let stand until morning. Pour the water off, rinse, then place alternate layers of grape leaves and the cucumbers in the pickling kettle. Pour over them alum water made of one teaspoonful of powdered alum to each quart of water; dissolve the alum in the water cold. After pouring it over the cucumbers, allow to come to scalding point. Let the whole stand closely covered, on the back of the stove for two hours, then drain and place in ice or very cold water. Pour this water off, wipe dry and place in a jar a layer of pickles and one of salt until all are in; allow about a pint of salt to each 100 medium-sized pickles. Pour boiling water over and cover with grape leaves. Heat this brine every morning for nine mornings. Then heat gently in warm, weak vinegar, wipe dry and place in glass jars. Pour over hot spiced vinegar and seal at once. The vinegar is to be prepared as follows: For each quart of vinegar (not too strong) allow two teaspoonfuls each of cinnamon and cloves, one teaspoonful each of mace and celery seed, a few thin slices of horseradish, an ounce of mustard seed, a saltspoonful of black pepper, a pinch of red pepper and a cupful of coffee A sugar. Put the spices in a thin muslin bag. Bring the vinegar to boiling point, add sugar and spices and let boil for 15 minutes; then pour over the pickles. Pickles made after this method never shrink or grow soft.

Pickled nasturtium seeds are an excellent substitute for capers, and they, with radish pods, make a nice relish for meats. Select the seeds as soon as the flowers have fallen off; gather them on a dry day. Spread in the sun for a few days, transfer to a jar, cover with well-spiced, boiling vinegar. Radish pods should be soaked in salt and water for three days; drain and cover with spiced vinegar.

Mustard Pickles.—Two red peppers, two heads cauliflower, two quarts silver skinned onions, one-half peck small cucumbers (gherkins), one pound brown sugar, three-quarters pound best mustard, three quarts vinegar, one-half ounce celery seed, one-half ounce white mustard seed, one dessertspoonful turmeric powder, one teaspoonful each cinnamon and cloves, five cents' worth mixed pickling spices. Put the cucumbers, onions and (picked) cauliflower to soak in salt water over night. In the morning drain; mix turmeric powder with dry mustard, wet with sufficient vinegar to mix without lumps; put remainder of vinegar over the fire, adding thereto the sugar, seed, spices, etc., carefully stir in mustard paste and let boil up well. Then add the mixed pickles (the peppers and seeds chopped), and stir all together. After it begins to bubble let boil well for five minutes; remove from the stove and put in jars.

Ripe Cucumber Pickles.—Thinly pare six ripe cucumbers, cut in halves lengthwise and scrape out the seeds, then cut into half-inch strips. Lay on a platter, sprinkle thickly with salt and let stand over night. Next morning drain and dry on a towel. From six large red peppers remove the seeds and cut in fine strips; also cut one root of horseradish into small pieces. In a stone jar pack the prepared cucumbers, peppers and horseradish, sprinkling through them one-half of a pound of white mustard seed. Pour over sufficient boiling hot vinegar to cover and set away. On the third day drain off the vinegar and arrange the pickles in glass jars. Bring the vinegar to the scalding point, pour over the pickles and cover them. In another week they will be ready for use, but will be better if allowed to stand for a month.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

Giant Pansies *Almost Given Away!*

A. T. COOK (the Reliable Seedsman), of **Campton, N. Y.**, will send our readers his mammoth Pansy Collection, comprising seed of 50 Lovely Ever-blooming Prize varieties: Life-size Picture in 10 colors; Treatise on Growing Pansies; Useful Book on The Window Garden; and a 15c. Present—all securely boxed and postpaid for **ONE DIME**, or 12c. in stamps; 3 Collections for **25c.** This is special to our readers. The collection is a wonder, and really cheap at 5 times his price. Every wide-awake reader should order one. **Do not Get Left. NOW is the time to plant the seed.** Be sure and mention R. N.-Y.

No More Spoiled Fruit.

Canning made easy and sure by using my Standard Patent Self-Melting, Self-Sealing Wax Strings. Very economical and easy to apply. Valuable fruit information, and 100 Strings by mail, for 45 cents in stamps. C. C. FOUTZ, Middletown, Ohio.

BUSINESS BITS.

WE know of no farm implement that has worked its way faster or more securely in general favor than the low-down wagons. The longer one has them the more uses he finds for them. They simply save labor for man in loading and unloading, and their broad tires makes draft lighter for the team. We are just in receipt of a nicely illustrated catalogue of the Electric Wheel Company, Quincy, Ill., showing many of the uses to which the low-down wagons are put, and something of the construction of their particular make. It will be sent you free, if you care to see it, and are interested in it.

PROBABLY the most remarkable advance of late years in agricultural practice is the increased feeding value lately given to the cornstalk. It has long been known that the stalk contained nearly or quite as much nutriment as the ear, but it has been impossible to utilize it. Machines for harvesting, fining and baling the stalk were needed before its great value could be realized. Now the McCormick corn harvesters and huskers and shredders have solved the problem, and surely made corn the king of grains. It always was in beauty, and now it is in economy. "King Corn" is the suggestive name of a pamphlet sent free by the McCormick Harvesting Machine Co., Chicago, Ill.

FROM now on to the end of September visitors to the Pan-American Exposition at Buffalo may see one of the 1901 Ohio self-feed silage cutters and new metal backed swivel carriers at work. It is used to cut green cornstalks for the different breeds of cows that are there under official test. About the middle of September a new Ohio Monarch self-feed ensilage cutter and new direct blast blower elevator will be used to fill a Green Mountain silo at the same place. These machines are both new, and this will give those who expect to attend the Exposition an excellent opportunity to witness and examine these machines and see them running under actual conditions, and this has special reference to the 1901 Ohio Monarch and blower elevator, inasmuch as this is its first season. These machines are made by the Silver Mfg. Co., Salem, Ohio, and the superintendent on the grounds will explain anything in reference to their work.

Alfalfa in Western New York.

I would seed in the Spring alone if possible. Prepare the ground thoroughly as for oats, and seed early. Keep the weeds down by running the mowing machine over the ground from time to time as needed, the first year. Alfalfa is a success here in western New York. My plot of five acres, seeded in the Spring of 1900, has cut two crops thus far this reason, and is good for one more. The stand was not a good one owing to the dry season of 1900, but the crop improves with good care and is making a good showing for itself. I shall seed another 10 acres to Alfalfa as soon as the piece can be made ready. I am heartily in favor of it. See that the ground is well prepared and moderately rich. Then sow from 15 to 20 pounds of seed to the acre with a seeder, and after the first season, from three to four crops can be cut each year of the best kind of hay. Stock eat it freely. M. ST. J.
Orleans Co., N. Y.

BORDEAUX ON POTATOES.—I did not use Bordeaux Mixture this year; have used it a number of times in years past, and found that it paid about one time in 10. Other growers that have used it have come to about the same conclusion, and but very little spraying for blight is now done in this section. Almost every farmer has a spraying outfit run by sprocket chain with two horses, and could easily use Bordeaux Mixture with his Paris-green if he wished. I think the potatoe crop of this section will be short next Fall on account of drought, and the terrific heat. The Rural New Yorker is the only variety, and I might say the only green plant, that has not wilted and in most cases dried up, during the past three weeks of 96 to 106 degrees of temperature. The Carmans are wilting badly every day, but revive somewhat during the night. E. H. CURRIER.
Wisconsin.

Pulmonary Consumption can be cured in its incipiency with Dr. D. Jayne's Expectorant. Of that there is no doubt; indeed, numbers of persons testify to having been cured by this remedy after the disease had reached an advanced stage. IT HEALS THE LUNGS.—*Adv.*

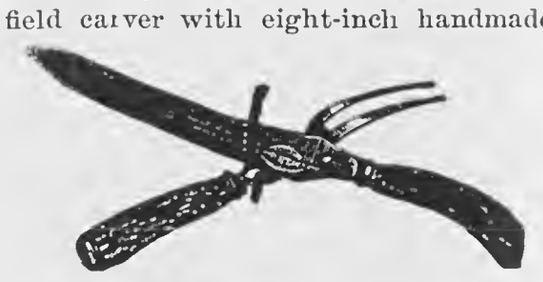
SWAMP OWNERS, **RAISE CRANBERRIES**
Properly prepared, the swamp becomes the most valuable part of the farm. Our long experience in this business enables us to supervise the construction of successful bogs. In pieces of 10 or more acres will take a small interest in part-payment of services. Terms on application.
F. A. MAKEPEACE, 8 Main St., Avon, Mass.

RAMS—A choice lot of Delaine and Black-Top Rams and Ewes to select from, will be sold cheap. Correspondence solicited. M. C. MULKIN, Friendship, N. Y.

A Carving Set.

Every family needs a carving set three times a day. This set consists of a Sheffield carver with eight-inch handmade



steel blade, buckhorn handle, fork and steel. Price, $1.90; or we will send it for a club of two new subscriptions at $1 each and $1.25 extra money, or free for a club of six at $1 each.

A Darning Machine.

This is the only successful darning machine we ever saw. We have tried others that were absolutely of no value. This one is little short of perfect. It enables you to mend underwear, stockings, curtains, table linens, clothing, and does an endless variety of art and fancy weaving better, easier and quicker than

by any other way. Full directions accompany each machine. When a lady has once used this little machine, she would not do without it for any consideration. We will send it postpaid for $1, or for two new yearly subscriptions at $1 each. All money returned if not satisfied.

Dietz JUNIOR Lantern Cold Blast.
For Kerosene.

A little smaller than the usual "Blizzard" Lantern, to supply a demand for a handy tubular lantern that shall give a good, full light and stay alight in any wind. But 12 in. high; weighs 26 oz., and holds enough oil for 13 hours continuous use. You fill, light and regulate the Junior without removing the globe, as the little lever at the side raises the globe to light, and locks the globe down on the burner. It is made with a round top oil pot, and is the handsomest tubular lantern made and absolutely safe.

Ask your dealer for Dietz Junior. If he hasn't it or won't get it, send us $1. and we will send you one all charges prepaid, safe delivery guaranteed. That illustrated Catalogue of ours will be sent you free on request.

R. E. DIETZ COMPANY,
(Established 1840) 87 Laight St., New York City.

BOOK BULLETIN

FOR SALE BY THE RURAL NEW-YORKER

FERTILIZERS, by E. B. Voorhees. The source, character and composition of natural, homemade and manufactured fertilizers, and suggestions as to their use for different crops and conditions. Price, postpaid, $1.

FEEDS AND FEEDING, by W. A. Henry. A discussion of plant growth and animal nutrition; feeding stuffs and their effects upon farm animals, rations for fattening and milk production; and numerous tables, giving complete results of feeding experiments; 657 pages. Price, postpaid, $2.

CUT-PRICE BOOKS.—Any of these 20-cent pamphlets sent postpaid for 10 cents:

How to Plant a Place.
Accidents and Emergencies.
My Handkerchief Garden.
Chemicals and Clover.
Country Roads.
Fruit Packages.

THE RURAL NEW-YORKER,
409 Pearl St., New York.

MARKET NOTES

BOOM IN CANNED GOODS.—One of the effects of the drought in the West, which cut short fruits and vegetables, is the unprecedented demand for canned goods, and their consequent rise in price, 25 to 40 per cent in some cases. The New York market for canned goods is more active than for eight or 10 years. This is because western dealers are buying so largely, not only for present, but future delivery, as there is no sign of any let up in the demand this season. Tomatoes, corn and apples are the goods most affected.

FRUIT NOTES.—Southern peaches are at their best and selling well. I have noticed a few from Jersey and nearby, but they were mostly small, green and inferior, and stand but little chance in competition with the flood of fine southern fruit. Anyone having early apples of fair quality to ship will do well to send them on, but by all means leave the worthless little gnarly ones at home, for there are too many of this kind here now, that no one wants. The continued warm weather has made a good season for watermelon men, and prices remain high. From noticing those piled up in front of the stores day after day, I judge that more small melons than usual have been received. Muskmelon receipts are light, and the better grades are selling well. Grapes are of such inferior quality that they go slowly. I noticed Niagaras offered at 25 cents per four-pound basket, but few people will buy poor grapes at a high price while there are plenty of good peaches. A great variety of pears are seen. A few nearby Clapp's Favorite are bringing $3 to $3.50 per barrel, but for any except prime pears are not selling nearly so well as apples.

POTATO PRICES.—The figures at which potatoes have sold in some markets during the past week are surprising. From Boston and other large New England cities come reports of $5, or even more, per barrel. At New York prices remain about the same as last week, and at this writing the demand is slow. There appears to be no doubt that the crop in the East and Central West, with here and there local exceptions, is light, but whether it is short enough to sustain extravagant prices is a question. There is a limited number of people who will have potatoes anyway, no matter what they cost, and with them the same is true of any other necessity or luxury. But they form only a small fraction of the potato eaters of this country. A great many have to do close figuring in order to make income cover expenses, and it is doubtful if they will say yes to a retail price of $5 or $6 per barrel for potatoes for very long. They are quite likely to eat more bread and to substitute rice and other cereals for the tubers. Of course, one who has a fair quantity of potatoes for sale in a season of scarcity naturally wishes to get all he can out of them, but there is a chance of getting his ideas up too high. There is no doubt that some of this class will dream of $7 or $8 per barrel, carry the crop through until Spring, with all the extra trouble of sorting and handling, and then sell at a figure, which, taking the shrinkage into consideration, will be less than could be had now. Holding a perishable product for high prices is uncertain business, and the man who practices it year after year will find that loss as well as gain enters into the transaction.

Beautiful Watches for Boys and Girls.
Easily obtained. Particulars and outfit is included in the 10c. Pansy Col. offered on p.587.—*Adv*

PAN-AMERICAN EXPOSITION NOTES.

Some of the Agricultural Exhibits.

PART II.

MICHIGAN has a very handsome display, especially of cereals, seeds and forage crops. It is got up in beautiful style, these different products having been used with good taste, and anyone who passes by will feel well pleased with the effect. There is also a fine display of wool.

MISSOURI has one of the best exhibits in the building. There are cereals in abundance, both in the straw and in the grain. There are a number of farm baskets, each filled with large ears of a variety of corn which is characteristic in the size of the ears, depth of grain, etc., a part at least of one ear of each kind being shelled to show the proportion of grain and cob. The wools of Missouri are shown to good advantage. The Angora goat industry is shown by illustrations, and there is also a nice display of mohair taken from several of the flocks. There is quite a nice display of cotton, which is grown to some extent in that State.

OREGON is represented with a very fine agricultural display. One thing which may not at first sight seem very attractive is a relief map made by Prof. Shedd, one of the best scientific scholars in the West, which shows all of the mountains, lakes, rivers, valleys, table lands, in fact, the entire State just as nature has made it. From this map one can get an excellent idea of the proportion of mountain lands to those of the valleys and plains, and the different elevations of each, and in some degree can form an idea of the soils and other physical characteristics. There are cereals, both in the straw and in the sack and in manufactured forms, and also an extensive exhibit of the same in the straw showing hundreds of varieties of wheat, oats, barley, etc. Corn does not appear prominently, although it is grown to some extent in Oregon. Macaroni and other like products made from wheat are shown in excellent condition—the wheat of that State being very suitable for this purpose. The display of wools is not only very extensive, but beautiful, especially the scoured wools from the mills at The Dalles. One of the statements made in connection with the wool exhibit is that Oregon has 2,500,000 sheep, which produce annually 28,000,000 pounds of wool and furnish 1,000,000 pounds of mutton annually, which is shipped to eastern markets. There is a beautiful display of hops from the famous Willamette Valley, where hop growing is carried on extensively. One rather peculiar product is pine-needle fiber, which is made into pillows, mattresses, etc., making an excellent substitute for hair and other material of this character. It has a peculiar fragrance which is very pleasant, and in addition to this there is an essence made which is shown in bottles, in condition to be used for inhaling, and also in the bath tub, as it has medicinal properties, as well as giving forth a delightful fragrance. The clams which are so abundant along the sea coast are shown in jars, and also the famous salmon from the Columbia River. There is also a beautiful painting of Mount Hood and its surroundings, placed conspicuously, which is a delight to every one who visits the Oregon exhibit.

ILLINOIS has mainly a corn exhibit. There are 42 different articles shown as being made from this grain, including hominy, grits, meals, starches, syrups, dextrine, etc. There is a corn oil which is used in making salads as a substitute for olive oil. It is also used in the manufacture of paints the same as flaxseed oil, to which it is said to be superior, although it is also somewhat more costly than the latter. Another product is a gum, like gum arabic, which is used for the same purpose. There is a rubber which is quite elastic, but not equal to the tropical rubbers. It requires mixing with these in order to make a good manufactured article of rubber goods. Another very remarkable product is called saccharine, which is 300 times sweeter than sugar. The whole arrangement of the Illinois exhibit is very fine, although it is made principally from corn. There are two large pictures showing farm scenes, which are made from the natural products of the farm. Illinois has done well in the Agriculture Building.

RHODE ISLAND has an exhibit such as we might expect from that little State, there being nothing whatever of agriculture, but only the oyster, clam and fisheries industries. It is well got up and instructive to anyone who will give it attention.

WISCONSIN has a very plain display of seeds and cereals in jars, with no attendant to explain things to the visitors, and they must judge for themselves about the exhibits. This is in great contrast to nearly all the other exhibits in the Agriculture Building.

MINNESOTA has a beautiful and picturesque display of grains and grasses principally. There is an old-fashioned corn crib, reminding one of old times on the farm. This State has not only a comprehensive farm exhibit, but one which is very pleasing to the eye.

NORTH DAKOTA has grains and grasses well displayed in their different conditions. There are many beautiful characteristic photographs of farm scenes, and a very large painting of some of the giant reapers in operation in one of the great wheatfields.

NEW HAMPSHIRE has an extensive display of the old-fashioned Yankee corn in its different varieties. There is also an extensive collection of popcorn, which is very attractive and instructive. Maple sugar and maple syrup are prominently shown, perhaps better than in any other State exhibit.

H. E. VAN DEMAN.

APPLE SHIPPERS' CONVENTION.

The annual meeting of the National Apple Shippers' Association was held at Toronto, Canada, August 7. J. W. Robertson, Canadian Commissioner of Agriculture, spoke on apple growing in the Dominion, and following are extracts from his address:

"Apple culture requires special knowledge and training. Many of the ignorant resort to books for their knowledge and purchase all sorts of varieties of apples. I have heard of one man who has six hundred varieties on his farm. From 12 to 20 varieties are all that should be grown in any particular district. They could then be grown to advantage, would speedily make a name and secure a better market. Canadians have been losing in the English markets by having too many varieties, and shippers might do much good by talking to the farmers and informing them what varieties are required. Too often the education of the grower is left to the college professor, whose pride it is to tell 150 varieties at sight and whose information is of no use to the grower in making money. The apple shipper should give exact information to the grower. The apple business in Canada has suffered severely from the faults of packing. 'What a thundering set of rogues you must be in Canada,' was once remarked to me in England, in reference to the practice of facing the barrels at top and bottom with good apples, and filling in with rubbish. Two special commandments for the apple man should be: 'Thou shalt deliver goods as they are represented to be,' and 'Thou shalt deliver them in the best possible condition.'"

George T. Powell, of New York, spoke on the possibilities of apple culture in the United States. He said that "Experience has shown that certain varieties are adapted to certain localities, and should be confined to them. The finest flavored apples are found in the belt extending from Nova Scotia through the New England States, reaching to Michigan, and taking in New York and north Ohio and a part of Illinois. The Northern Spy does not grow to perfection outside New York, Canada and Michigan. Growers should depend upon the varieties originated in their own soil and climate."

Charles Forster, of New York, read a paper on apple exportation. He showed that the past year was an exceptionally heavy season for the export shippers, the trade having shown an unusually large increase over the previous year. Canadian exporters shipped about 700,000 barrels of apples to the European markets, 280,000 barrels of which were exported from Nova Scotia. In the United States the New England States have become the leading center for exporting apples to the English markets. The total exports from New York, Boston and Portland were 805,000 barrels. Other addresses were made by D. S. Beckwith, of New York; C. H. Williams, of Illinois, and W. H. Barnes, of Kansas. The press committee reported the following as the indicated percentages for this year's yield: Ontario, 35 per cent; Nova Scotia, 75; New England, 25; New Jersey, 25; Pennsylvania, 40; New York, 20; Maryland 50; Virginia, 65; West Virginia, 65; Kentucky, 35; Tennessee, 35; Ohio, 40; Michigan, 30; Indiana, 40; Illinois, 40; Missouri, 45; Arkansas, 50; Kansas, 45; Nebraska, 45; Iowa, 25; Colorado, 85; Wisconsin, 15; California, 90; Oregon, 80; Washington, 80; general average, all sections, 46.

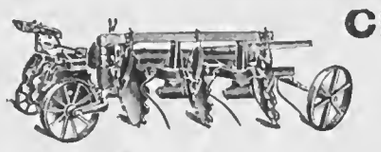
A USE OF MANURE.—Director Thorne, in a recent bulletin from the Ohio Station, mentions one use of manure not understood by all: "When a piece of marshy land has been drained it is often found that the crops planted upon it fail to thrive, although it seems to be very rich in nitrogen. The remedy here is to add barnyard manure, something which savors strongly of carrying coals to Newcastle; but the explanation is that the semi-aquatic vegetation which formerly occupied the land decays so slowly that cultivated crops cannot get nitrogen rapidly enough for their needs. When the manure is added, however, it sets up a fermentation which converts the nitrogen-bearing materials into a more soluble, and hence available form."

DR. PIERCE'S GOLDEN MEDICAL DISCOVERY

"I have been thinking of writing to you for some time," writes Mrs. W. D. Benson, of Maxton, Robeson Co., N. C., "to let you know what a wonderful thing Dr. Pierce's Golden Medical Discovery did for my little boy. He was taken with indigestion when he was a year and a half old, and he was under the doctor's treatment for five long years. We spent all we made for doctor's bills, and it did no good. He could not eat anything only a little milk and cracker, and sometimes even this would make him sick, and he got very weak; could not sit up all day, and I gave up all hope of his ever getting any better. Looking over one of your books I noticed Dr. Pierce's Golden Medical Discovery recommended for indigestion. We bought some and gave to our boy. Two bottles of Dr. Pierce's Golden Medical Discovery cured him. He is well as can be, and can eat anything that he wants and it does not hurt him. He has not been sick a day since, and it has been three years since he took your medicine. I pray that God will always bless you and your medicine."

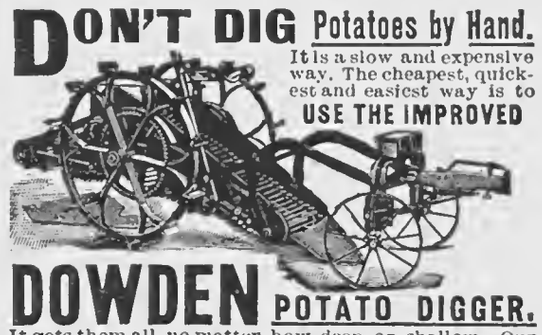
FOR DISEASES OF THE STOMACH, BLOOD, NERVES AND LUNGS.

FENCE WIRE AT WHOLESALE
Send for price-list and free catalog of Wire Fences & Supplies. W. H. MASON & CO., Leesburg, Ohio.



CLARK'S DISK GANG PLOW
Sizes 2 to 8 feet wide or more for horse or steam power. TRASH CUTTER, perfect turner, light draft, strong, durable and cheap. *Made Only by*
THE CUTAWAY HARROW CO., Higganum, Ct.
Send for Circulars.

DON'T DIG Potatoes by Hand.
It is a slow and expensive way. The cheapest, quickest and easiest way is to
USE THE IMPROVED



DOWDEN POTATO DIGGER.
It gets them all, no matter how deep or shallow. Our book explains how. The book is free. Write for it now
DOWDEN MFG. CO., Box 22 Prairie City, Iowa.

WELL DRILLING Machines
Over 70 sizes and styles, for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.
WILLIAMS BROS., Ithaca, N. Y.

SHOO-FLY The Animal's Friend
Kills every fly it strikes; keeps off the rest. Harmless to man or beast. ½ cent's worth saves 3 qts. milk and much flesh. Send $1.00 for Improved Sprayer and enough Shoo-Fly to protect 100 cows, or 25 cents for liquid alone. Guaranteed.
SHOO-FLY MFG. CO., 1005 Fairmount Ave., Philadelphia, Pa.

Gold-Shell Rings.

Most people like a nice ring. We show three styles. These are made by drawing a shell of gold over a rod of composition metal. They are better and will wear longer than solid gold rings of a low carat. The retail price would be from 75 cents to $1. We will send one of these rings postpaid as a reward for sending one new subscription at $1. Cut a slip of paper the size of finger and send for size.

Live Stock and Dairy

Ailing Animals.

ANSWERS BY DR. F. L. KILBORNE.

Colic Mixture for a Horse.

Will you advise a good safe remedy to keep handy in the barn in case of colic in a horse? We had a horse die last Summer from colic, and we have one now that I think is subject to it. A. M. H.

Flemington, N. J.

One ounce each of sweet spirits of niter, sulphuric ether and extract Jamaica ginger, to be given in a pint of cold water, and repeated hourly until relieved, or the veterinarian arrives.

Cow Suspected of Tuberculosis.

I have a cow that coughs a good deal; one side of udder cakes sometimes. She has a good appetite and is in good flesh. What can I do for her? T. J. B.

Beverly, W. Va.

The brief symptoms you describe are strongly suspicious of tuberculosis. Have the cow examined by a qualified veterinarian, and if necessary, submitted to the tuberculin test for tuberculosis.

Lice on Pigs.

I have two sows (one with pigs) running in an orchard, and they are covered with lice or ticks. The insects are round flat things, and very lively. I have tried insect powder, but it did no good; also tried alcohol, which killed some, but does not seem to clean them out. What can I do to get rid of them? C. B. H.

New Haven, N. Y.

Sponge the pigs all over with a mixture of kerosene emulsion, or of kerosene in six to eight parts of water. The emulsion is preferable to the kerosene alone, on account of its mixing more readily with the water. However, when you have but a few animals and do not wish to go to the trouble of making the emulsion, the kerosene can be used, if it is kept well mixed with the water. Repeat the application every five or six days until the lice disappear. Two or three applications should be sufficient.

Warts on a Heifer.

I have a Holstein heifer that will be two years old this Fall. She has a great many warts on her body, also a large one on the udder that may interfere with her being milked. Is there any remedy for them? She is in fine condition and a hearty feeder; not a wart on her dam.

Ancram, N. Y. C. L. B.

Rub the warts freely twice daily with pure vegetable castor oil (to be obtained of your druggist) and continue for at least four weeks. Any large warts that have a well-marked neck can be more quickly removed by tying an elastic band tightly around the base of the wart and allowing it to slough off. As soon as the wart drops off cauterize the raw surface with a stick of nitrate of silver, after which dust daily with iodoform, oxide of zinc or other antiseptic powder until healed.

Calomel for Lice on Calves.

Last Spring a druggist recommended me to use calomel to remove lice on calves. It was dusted on the two calves, and in a few weeks one died bleeding at the nose—feces like tar. In a few weeks more the other one died and its internal organs were examined. Its stomach and bowels were ulcerated. I asked the druggist whether the calomel could have caused the deaths, but he said it could not possibly have done so. The only directions he gave were: "Dust this on them and work it well into the hair." What is your opinion? If the calomel caused the loss, would the druggist be responsible?

Pennsylvania. H. C. Y.

The mercurous chloride or calomel is a powerful drug, and not a safe remedy to use freely on calves for lice. They would be liable to lick off too much of the drug, and might become poisoned. If the calves died within two or three weeks after the use of the calomel, or if they were sick within this time and died later, it is quite probable that the calomel may have been the cause of death. But if they died later, without being ill in the meantime, death was probably due to some other cause. Even if the calves were poisoned by the calomel, it would be very difficult to prove it so as to make out a case for damages, unless the organs were submitted to a chemical examination, showing the presence of the calomel in poisonous quantities. Your experience shows the necessity of using or administering powerful medicines only under the direction of a competent practitioner. It was either inexcusable ignorance or gross carelessness on the part of a drug clerk to prescribe the use of calomel on calves for lice, without advising you of the danger of using it too freely.

BETTER QUALITY OF MILK.

Will It Pay the Farmer?

There seems to be a growing demand, at a slightly increased price to the producer, for a milk richer in butter fat. This tendency is felt most in those places producing milk for retail trade, but is by no means confined to that part of the business. Our correspondence, which is mainly with milk producers, clearly indicates that something beside the satisfaction incident to owning a purebred bull is impelling farmers to buy that sort of animal to head their herds. Indeed, we have sold a great many of our best bull calves to farmers and creamery men to grade up their herds. CHAS. H. ROYCE.

Dutchess Co., N. Y.

Nearly all of the creameries in this State are buying milk on the basis of the per cent of butter fat, and the producers of milk are therefore paid according to its value. The policy of recognizing the distinction between good and inferior milk has become almost universal. At the college creamery, where we purchase between 15,000 to 25,000 pounds of milk daily, the price is governed not only by percentage of butter fat, but by its condition as to wholesomeness, freedom from taint, and other qualities as well. There is then every encouragement to the milk producer to select, breed and feed for good milk; at the same time keeping economy of production prominently in mind.

[Prof.] C. F. CURTISS.

Iowa Exp. Station.

"Farmers and dairymen are advised to grade up their herds of cows in order to produce a better quality of milk." I hold that this is good advice. I believe it is the universal custom of all creameries to purchase milk on the basis of the butter fat contained. The general proposition is, whether a farmer sells his milk direct to consumers or to the creameries, or makes butter for sale, that it is good policy to produce his milk from purebred dairy cattle, for the reason that he gets a larger product with the greatest economy of feed, and by reason of the increased secretion of butter fat gets a higher price for his milk. I believe the time is rapidly approaching when no dairy farmer can succeed with scrub cows in combination with purebreds. GUY C. BARTON.

Nebraska.

We do not think that dealers are willing to pay a fair price for rich milk, but have found that the consumer is willing to pay a better price for milk of a superior quality. We have had frequent remarks made about the sweetness of our Jersey milk over ordinary milk, as well as commendation for improved quality of cream as well as the richness. A bottle of my milk taken out of that which had been prepared for morning delivery without selection for quality, showed by analysis (of our State College) butter fat 4.8 per cent and solids of nearly 14½ per cent. We believe that if milk is properly handled, aerated and cooled, customers will pay more money for rich milk than they will for milk of poorer quality. Personally, we believe that there is not enough attention paid to the percentage of solids in milk, and also to the feeding of the cattle for digestibility of milk. Certainly milk can be changed to a certain extent in that particular. R. F. SHANNON.

Pennsylvania.

Is it practicable for dairymen to sell rich milk at an improved price? Yes, if the price is enough in advance over the ordinary to repay for the extra quality of cattle kept and extra cost of the best feeds to insure the best quality of milk. Eight cents per quart at least should be received for a better quality of milk than the present standard demands. As to whether milk dealers are inclined to pay for milk on the basis of per cent of butter fat, when the milk is flush they drop the milk of the one furnishing the poorest quality. In this way the producer of the best milk has the best of it. The question is asked whether there is practical inducement for the average milk farmer to improve his herd by the use of good Jersey or Guernsey bulls. If he is peddling milk direct from his own farm there is, as he is brought in direct contact with the consumers, some of whom are willing to pay for quality, and he can in time pick a route of such, but it takes time and costs money. Milk buyers are recognizing the fact that there is a great difference in the quality of milk, but they are not going to pay for it if it can be avoided, preferring to force it by State laws, and pay as little as possible. The wholesale milk dealer will not offer cash or practical inducements for an improved quality of milk if he can avoid it. J. B. B.

Massachusetts.

A Talk About Milk Handling.

We who ship our milk to New York are very careful and cleanly in our milking, and strain through patent strainers that are set in the top of our 40-quart shipping can, and to insure thorough straining we put on the bottom of strainer, fastened by rim made for the purpose, three thicknesses of fine cheesecloth, which takes out every particle of sediment. A simple wire strainer, no matter how fine the wire, will not remove all of the dirt. As soon as a can is full we place the can in ice water, each and every one, and keep it as low a temperature as ice will make it until the hour for daily shipment arrives. Milk should be stirred at intervals three times, say 10 minutes apart, to take out animal heat as soon as possible, which makes it sweeter and better.

Most farmers keep 16 to 20-quart coolers in addition to their cans, enough to use for one or two milkings, but these are seldom used, only as temporary receptacles for milk in case cans are held back, as sometimes happens by delay of trains. Regarding your question whether the Milk Producers' Association had any effect in the methods of milk handling, I think not, only as in their advised judgment that all milk can be better handled and cared for through cooperative creameries where every facility is used to make a superior article. Each and every farmer who ships milk has a milk room fitted up inside barn or adjacent thereto, with water vats and ice tanks. Some do not have to use ice, as water that stands at 42 to 44 degrees Fahrenheit is cool enough for shipment. Water that stands at 42 to 44 degrees is better than a lower temperature made with ice, unless milk is submerged in ice water in transit to New York. Train hands who handle our milk are not always careful to keep it well iced in transit. All cars that haul milk to our cities should be fitted with tanks in which the cans be placed and kept submerged to the necks in ice water. Many thousands of dollars could be saved to the farmers of the five States shipping milk to New York if their milk could be kept at an even temperature of cold until it arrives at its destination, through having refrigerator cars for the purpose, as every farmer loses by sour milk all because it is not properly seen to on trains and kept iced as it should be. I should think that liquid air would come in play for refrigerating purposes on trains handling milk, butter and all perishable products sent by shipment to our cities. A. B. M.

DAIRY AND FARM NOTES.

Facts About Silos and Silage.

SILAGE CORN.—I wish there was a sure and easy way to tell just when corn contains the right amount of water for the silo. Formerly the plan was to get the corn in as soon as cut, without regard to its water content. I am convinced that this method is not a safe one for our locality. Five or six years ago we unfortunately put a hammer wrench through our cutter, with the result that a delay in cutting of four days followed. Ten acres of corn were already cut, and the weather was exceedingly hot and dry. One can easily imagine how the leaves would rattle and have every appearance of being too dry. I felt much anxiety and uncertainty about the result without wetting, but it was inconvenient to wet the stuff, and we took the chances. To our surprise the following Winter we had no better silage anywhere in four silos than this same apparently overdried corn. I was rather shy about giving the experience until the following Winter, which gave an opportunity to repeat the experiment, without the expense and bother of a smashup. The results were the same. I then felt quite free to advise it in institute work, that is in years like the present, when corn did not fully dry out before cutting. In many meetings men would indorse the idea, not usually from a well-planned experiment, but from feeding corn that had for one cause or another become dry to the eye. I do not suppose outside of our more northern latitudes that this scheme will have any value, but for the parallels of central New York and north of them, the problem is certainly worth studying. Even here one must take the advice with good judgment (not unlike all advice). In 1899 and 1900 corn was sufficiently dry for best results, and often the addition of water was advantageous.

LIGHTER STALKS.—I find another advantage aside from better silage, the corn is much lighter to handle, and our men appreciate the change. We have approximated odorless silage since adopting the drying method, which we did not get before with certainty. I have repeatedly said that one could not tell whether we fed silage or not, except at feeding time. The corn plant is unlike other forage plants, in that the stalk retains its water a long time. Although the leaves may be dry and rattle when the whole is mixed together and trodden down it feels wet to the touch. We are fast approaching a certainty of producing good silage without having "good luck." Air-tight pits, or nearly so, and fine cutting are largely responsible. We have practiced the extreme of weighting and tramping, even putting horses into the pit, and the other extreme of neither weights nor treading. It is my experience that we need a bit of Samantha's "mejumness," which means fine cutting and even distribution and some treading, not on the sides alone, but over every part alike. The excessive treading near the walls means putting more corn there; when the center settles most, as it will, the silage is consequently drawn from the sides, allowing just enough air to produce a white mold and a sticking together of the fodder. No silo question so often comes into the institute question box as this one. I do not now remember working out a single case in which the side walls were tight without finding this excessive treading the acknowledged cause. I have changed my mind in regard to a fine cut. The quality of silage, all other things being equal, is due to our ability to keep out the air and stop fermentation, and coarse fodder will not do it.

SILO TEMPERATURE.—Our scientific friends have not given us sufficient data on silo fermentation. By the time they get it worked out, I am in hopes we shall have succeeded in putting the corn away so free from air contamination that there will be no ferments at work to break down and destroy the feeding value. I observe that our good silage of recent years is cool. I had to confess ignorance last Winter to a question as to what degree the thermometer will register in a silo in the Winter a foot below the feeding surface. I answered by saying it should feel cool, much to the discredit of institute work as then determined, but I know our silos were not near to blood heat. The next morning a man came to me very quietly and said his silo registered 72 degrees. I went home the following Saturday and found in three silos then opened a temperature ranging from 62 to 75 degrees. These silos were filled with corn fairly dry, cut very fine, and packed as previously mentioned. We used last year a cutter with blower attachment and liked it so well that we shall use a similar machine again. The power required to elevate a ton during the same period of time is fully one-half more. Of course this latter statement is guesswork, because I had no means of accurate measurement, but the saving in bother with a chain carrier would more than balance the extra cost of power. One year's experience often fails fully to establish the right or wrong of a plan, and I shall take the liberty of giving the experience again after silo filling, which is so near at hand. With a good harvester, 12 willing men, and good power and machinery, silo filling has lost its dread of former years.

ALFALFA VS. CLOVER.—We have again changed feed from Alfalfa, all they would eat, to Red clover all they will eat. For the first few days the milk showed a gain, the last three days a shrinkage. I am not quite able to account for it. I don't know that they are getting enough dry matter. The growth is very rank. We had measured off a piece which was to be weighed August 15. While I don't care to exaggerate, our foreman says it will cure out two tons of hay to the acre, and he is a man who is always conservative.

ESSENTIAL THINGS.—"Do you always do the things most necessary to be done?" I find that to answer the above question in actual work is not easy. I like to see things nicely done, but a man can easily spend too much time oiling his harness or blacking his shoes. I know a farmer who would in plowing strike out his lands by stake, so straight and true that the last furrow in a land always had full even width through its whole length, but the amount of cultivation done was so meagre that he never grew a maximum crop. I have heard long arguments about milking, should the front teats be milked together and the hind teats the same, or should the milker cross, one front and one hind teat, when I knew by observation that the cows on their farms had never been fully and judiciously fed. I have spent time and money working for a fancy trade for our butter and cheese, and then taken milk into the factory that injured the quality of the whole day's output. I have always been opposed to job work in construction of buildings because of the great tendency to ignore this question. We built a large barn in 1888 and found it quite expensive, about $3,000. A year after a barn was built near us, smaller in size, yet at one-half the cost. I felt somewhat chagrined at our inability to get a good deal. To-day the difference is apparent—in more than one spot, the essentials were not attended to. There is a foundation wall to everything we do, but it requires a good mechanical eye to build it and have no cracks appear when the strain comes. The strain, the wear and test come sooner or later to every piece of work we do, and while we may "cut and cover" for a time, eventually the "paint and putty" will crop out in field or home, in constructive work, animal breeding, or plant growth. H. E. COOK.

Building a Round Silo.

I have a square silo, but will build a round one in Spring. Will you give me plan of best silo (round) to hold 125 tons? I would like to know how much lumber and hoops and what kind of foundation—if any—and anything else regarding the construction. J. H. M'D.

No. Bridgewater, N. Y.

Without doubt the best form of silo for you to construct is the round stave silo. If you desire a silo large enough to hold 125 tons of settled silage it will be necessary to construct one which will have a total capacity for about 150 tons. This is necessary because of the fact that the silage settles considerably, and the 150-ton silo would have a capacity for only about 125 tons of settled silage. It is not possible to fill a silo with settled silage. The silo should be 30 feet high and 18 feet in diameter. If it is desired to have silage for Summer feeding it will be better to construct two silos, 24 feet high and 14 feet in diameter. In making the foundation for a stave silo many have made the mistake of constructing expensive stone walls upon which to set the staves. A stone wall is unnecessary, and better not constructed. All that is necessary in the way of foundation is to scoop away the surface soil to a depth of six or eight inches over a space a little larger in diameter than the proposed diameter of the silo. Begin the foundation by paving this space excavated. Place at the bottom the larger stones, and work in smaller stones near the top, and top with a layer of coarse gravel. Make a thin mortar, using water lime one part to four parts of sand. Make this mortar so thin that when poured over the stones it will run down between the stones, filling all the interspaces. With a maul or pestle pound the stones firmly down, so there shall be no open air spaces in the foundation. Much of the success depends upon the thoroughness of the pounding. After the water lime has become fixed finish off the top with a layer one inch thick made of Portland cement one part, good sand three parts. This will give a firm solid foundation, and the staves may be set directly upon the Portland cement that forms the topping.

To construct a silo 30 feet high and 18 feet in diameter there will be required 108 staves six inches wide, two inches thick and 30 feet long, or they may be used in lengths of 20 feet, making joints at 10 and 20 feet from base. Eight hoops will be needed to hold the staves together. They should be of ⅝-inch round steel, and be joined by cast iron lugs. It would be cheaper to use some form of woven wire in place of the steel hoops. The Page Woven Wire Fence Co., Adrian, Mich., makes a wire on purpose for use on stave silos. In Bulletin No. 167 of the Cornell University Experiment Station, Ithaca, N. Y., you will find many valuable hints about the construction of stave silos. The bulletin will be sent you free upon request.

L. A. CLINTON.

SHOULD HORSES FACE THE LIGHT?—When I built my barn I made boxstalls for my horses, and on the one side there is a window to every stall, on the opposite is the feeding alley and no windows. The horses are loose in the stalls at all times, and whenever they are not eating they face the light or stand sideways to the light. It hardly ever happens that I see them facing away from the light. As a rule, they face the windows, but, of course, the sun does not shine in their eyes. It would be cruel to hitch a horse so as to compel him to face the glare of the sun, but were I to build a stable I would face to the light if I could avoid the direct sunshine because that is the verdict of my horses, and that I call "horse sense." Leg and Body Wash.

Race horses often become sore and stiff from continued strain on the hard tracks. Nothing takes out this stiffness and soreness like a wash compounded of diluted

Tuttle's Elixir

apply to the legs and put on light bandages. Sponge the body and put on light blanket. Guaranteed to produce desired results or money back.

Readville Trotting Park, Mass., March 23, 1900.

Dr. S. A. Tuttle, V. S.

Dear Sir:—I have used your Elixir for the past ten years, in the diluted form for a leg and body wash. I consider it the best wash for keeping horses from soring up. Horses done up with this wash are much less liable to take cold than when done up with witch hazel or any other wash I ever used. J. H. NAY.

Our 100-page book, "Veterinary Experience," FREE.

Better than Hay!
SHREDDED FODDER
PREPARED BY McCORMICK MACHINES
When properly cured and shredded, corn fodder is better than hay. Owing to the partial failure of the hay crop and the injury corn sustained by reason of the drouth, it will be necessary for farmers to save all of their corn crop,—the fodder and stalks as well as the ears. To do this effectively machines will be required. The McCORMICK Corn Binder and McCORMICK Husker and Shredder are the best machines for handling corn. They enable the farmer to double the value of his corn crop. They pay for themselves.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LX. No. 2692. NEW YORK, AUGUST 31, 1901. $1 PER YEAR.

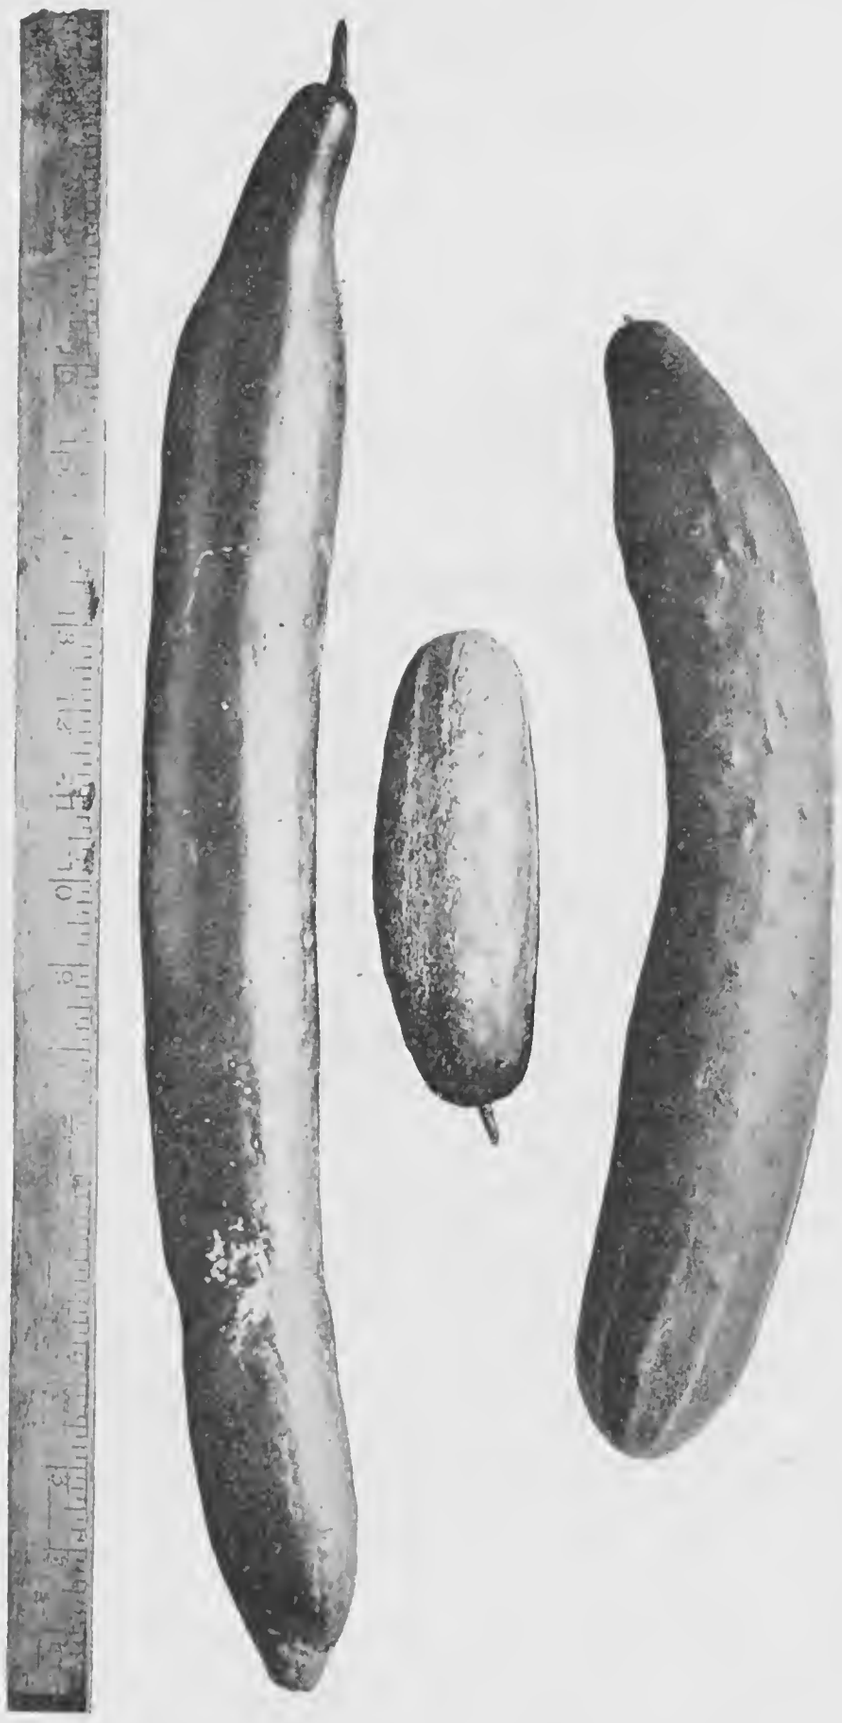
SOME EARLY HISTORY OF THE GRANGE.

SMALL BEGINNINGS OF A POWERFUL ORDER.

How Some of the Pioneers Worked.

The Order of Patrons of Husbandry was an outcome of the Civil War. President Johnson and Mr. Newton, the Commissioner of Agriculture, sent O. H. Kelley on a trip through the South in the Winter of 1865-66 to see what could be done to help restore the farmers and planters to prosperity. Mr. Kelley was a Minnesota farmer, who had been connected with the Department of Agriculture a short time. The depressed condition of the South suggested the idea to him that a secret society of farmers through the whole country, both North and South, might not only promote a brotherly feeling, but help the farmers in many ways. When he returned to Washington he talked with several friends regarding the matter, especially William Saunders, Superintendent of the Department garden and grounds; J. R. Thompson, of the Treasury Department, and William M. Ireland, of the Post Office Department. The four invited the Rev. John Trimble to criticise their work. Later, Rev. A. B. Grosh and F. M. McDowell, a fruit grower of Wayne, N. Y., helped them in some way. These seven men are generally called the "seven founders" of the Order. Mr. Kelley's niece, Miss Caroline A. Hall, suggested that women be taken into the Order on terms of equality with men. She also wrote songs for the Order and helped in many ways. During the 12 years Mr. Kelley was National Secretary, Miss Hall was his assistant and cashier. Nearly half a million dollars passed through her hands during this time. Anson Bartlett, of Ohio, also helped Bro. Kelley a good deal in preparing the ritual, but in reality Bro. Kelley was the man who did the hard work and took all the responsibility when there was no money in the treasury, which was often the case. Bro. Trimble used to say to him: "Go ahead, and if you make it a success I will hold up both hands and say, 'didn't I tell you so.'" December 4, 1867, the National Grange was organized with William Saunders for master; Anson Bartlett, overseer; J. R. Thompson, lecturer; William Muir, of Missouri, steward; A. S. Moss, of Fredonia, N. Y., assistant steward; William M. Ireland, treasurer; O. H. Kelley, secretary; the remaining offices left vacant because there were no members to fill them. Rev. A. B. Grosh was made chaplain a little later. In this humble yet bold way these five men began this now great society.

April 3, 1868, Kelley went to bid Saunders good-bye, previous to starting west to organize Granges. "Have you got any money?" "Yes, about $2.50." "Well, you are a fool." "Can't help that. I'll make the Order a success or bust." He tried to organize at Harrisburg and at Penn Yan, but failed; then went to Fredonia, N. Y., where he organized the first working Grange in the world, with N. E. Dodge as master, with only 10 members, all men. It is impossible for us of the present day, who are used to seeing the Granges in good working order, to imagine the trouble and difficulties Kelley met and overcame. It was a new and untried experiment, and required an endless amount of thinking, talking, planning and experimenting to get the thing in working order, but Kelley had so much faith in it that he threw up his clerkship and salary, and with a family to support and his Minnesota farm mortgaged worked his way west, trusting to the $15 fee for each Subordinate Grange dispensation issued by him to pay his expenses. These founders of the Order were mostly Free Masons, and sometimes he met a Mason who let him have some money, which was all returned later when money began to pour into the National treasury. It may be well to say that Fredonia Grange No. 1 lapsed or became dormant as we say after a little while. Bro. McKinstry, its first lecturer, says it was because it at first attracted mostly village people, who cared nothing about farming; that most of them did not have either crops or stock. He says: "We had no more idea of making it practical in the farming line than a Free and Accepted Mason has of laying brick." But to-day Fredonia is a large and prosperous



TELEGRAPH. WHITE SPINE. CROSSBRED.

CROSSBRED CUCUMBER AND PARENT TYPE. FIG. 260

See Ruralisms, Page 598.

Grange, composed of farmers. Kelley went on to Minnesota to his farm, organizing a few Granges on his way. From there he wrote to his associate, McDowell: "My wife has a block of 20 lots in a town in this State, intending to keep them as an investment for the children, but we must have funds to set this Order ahead. If you can raise any money by mortgaging these for 18 months you have full power to do so." Thus closed the month of July, 1868, the darkest in the history of our Order. He then went on starting Granges in Minnesota, one in a living room 12x16, with a stove, bed and other kitchen furniture in it. February 23, 1869, he organized the first State Grange, Minnesota.

The first annual session of the National Grange was held at Washington, April 13, 1869. Those present were Bros. Saunders, Grosh, Ireland, Trimble, Thompson and Kelley. D. Wyatt Aiken, of South Carolina, General Deputy for the Southern States at that time, says: "At the third annual session Worthy Master Saunders with marked dignity delivered his inaugural in the presence of Secretary Kelley, his entire auditory, and when he concluded asked leave to print in the next morning's daily papers, that the two might buy a few extra copies each, and thus be enabled to circulate their proceedings. Of course leave was granted. The printing was done, and 200 copies of the morning paper were distributed at private expense." It was not until January 8, 1873, that a real National Grange (a delegate body) met in Washington with 17 delegates from 11 States. More than half of the Granges were then in the States of Iowa and South Carolina. Then began the rush into the Grange; 1873 added 8,668 Granges, and 1874 brought 11,941 more Subordinate Granges into the Order. Brothers Kelley and Trimble are the only survivors of the "immortal seven."

S. W. COX.

Caledonia, N. Y.

FARMS IN THE SHENANDOAH VALLEY.

What a Farmers' Club Has Done.

I read in your issue of August 3 the letter of S. H. McK., of Gerrardstown, W. Va., relative to conditions in the Shenandoah Valley. I live near the old town of Winchester, Va., right in the heart of the Valley, a spot renowned in song and story. Being rather inclined myself to take exception to the tone of S. H. McK.'s letter, as being likely to convey a wrong impression of the exact state of things here, I had the same read to-day before our farmers' club. I might say of this Mutual Farmers' Club of Frederick Co., Va., as it is styled, that it is a body composed exclusively of farmers; was organized about 30 years ago, and still counts among its members about a half dozen charter members. Although the footprints of Father Time are plainly visible, yet these gray-haired sires still take a lively interest in all matters that pertain to farming. The club meets monthly at the residence of one of its members, making the round about once a year; has its officials elected annually, holds two sessions at each meeting, discusses subjects and exchanges ideas relative to our business, eats a good dinner prepared by our hostess, views the premises of our host, and offers timely suggestions if such are deemed necessary; then we return to our homes and feel highly benefited by our day's outing. As our club has taken upon itself to see to it that our farming interests are fairly represented, I have been appointed in behalf of same to send a line in reply to the letter of our worthy friend. He tells you that, had your question been as to the value of land now, as compared to 40 years ago instead of 20, he "could readily tell you that there has been a great slump." To voice the opinion of this club, lands are really higher now than they have been at any time during the past 40 years. Of course, immediately after the Civil War prices of land as well as all other commodities were higher, but it must be borne in mind that these prices were inflated because of cheaper money. This latter fact being taken into consideration, one has but to search the records in the clerk's office to verify the statement I have made as to comparative prices of land. The letter also states that very little land is changing

hands, and I might add that very little is offered for sale, both of which facts seem to point to the conclusion that farmers are pretty well satisfied with their condition. Another fact which has an important bearing upon this subject is, that our banks are at a loss what to do with their money. Bank officials say that while a few years ago farmers were their principal borrowers, they now cut no small figure as depositors. This would seem, at least, to be a contradiction of the rather gloomy view of the farming industry here as the writer puts it. Perhaps I ought to say that our location is about 20 miles farther south, and what he says with regard to the enhancement to double its former value of his own farm by the planting of fruit trees, applies also to much of the land in our own immediate section. The fruit industry is assuming large proportions. Large commercial orchards are quite common, and the area is widening with each successive year. Several have sold their peach crops, and about all the apple crop, consisting of thousands of barrels, has already been purchased by New York and Philadelphia firms at paying prices. L. M. BOYER.

ABOUT A RURAL TELEPHONE ASSOCIATION.

Two years ago, when H. W. C., of THE R. N.-Y., was in Ohio, he was greatly interested in the construction of a small rural telephone line, and the more so from the fact that he saw the president of the company digging holes for the poles. He remarked that it was a sight to see the president of a telephone company in a hole. That little company is now a pretty lusty rural line, and of it, and its connections, I wish to write. By reference to the accompanying map of Geauga County, O., a rude sketch is made to show something of the system that now covers completely not only Geauga County, but the north part of Portage, and east section of Cuyahoga counties, including the small city of Chagrin Falls, having its connections with all of the large independent lines east, west and south. About 18 months ago the five small companies represented that were doing business in Geauga Co., Chardon, Burton, Staffords, Bainbridge and Chagrin Falls, formed an association for mutual benefit and protection, and fought out to a finish an attempt of the "Bell's" to put them out. Then it was shown that the toll that each company levied upon the other for service, was practically an even-up affair, and the five companies established a system of free transmission of messages, so that now a subscriber in one company has the free call of any other box, in the association, although each company maintains and equips its own lines independent of the others. This proved a great feature, and the lines were, and are now being extended with great rapidity. There are from 40 to 100 'phones in each of the townships, and including the Garrettsville company, which is to become a part of the association, the total number of 'phones reaches something over 1,500. Of these, fully 1,000 are in the homes of farmers. In addition, the companies are connected with all of the great independent lines, with the Lake Shore lines to Erie and Buffalo to the northeast, the Mahoning Valley lines to Pittsburg and the east, on the south with the United States lines, and Citizens', and to the west through Cleveland with the great Cuyahoga company, the greatest of the Bell's rivals, the connections with Cleveland giving about 8,000 subscribers there alone that can be called from any 'phone in the association.

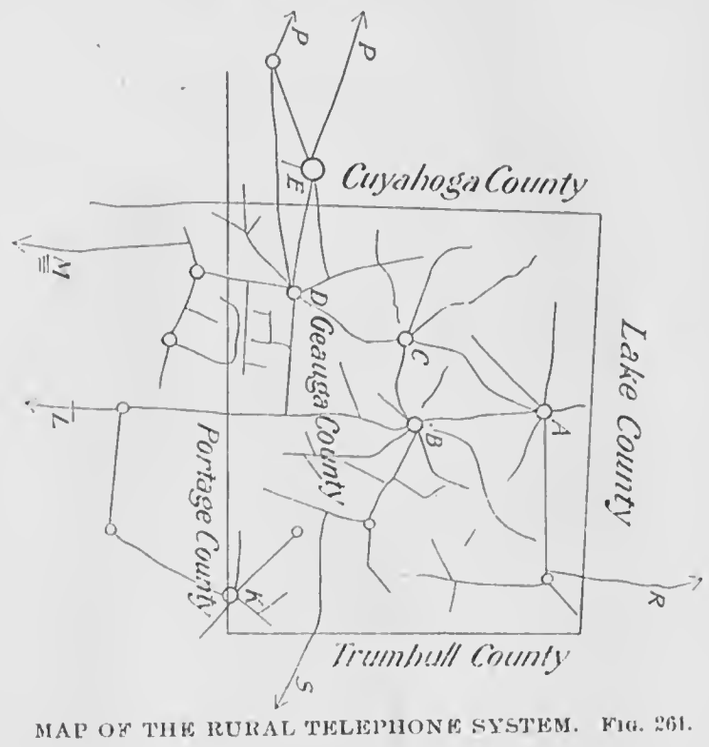
In this Geauga Association a uniform charge is made of $12 per year per 'phone, and no extras, when transmission is made over outside lines, and a minimum rate is then secured. In the territory covered it is said that there is not a firm, store, physician's office, or stock dealer's office but what has its 'phone, and the amount of country business done over the wires is a surprise. Often it is small and commonplace, but all the more reason that it should not take hours of time to transmit it when the 'phone helps do it "in a minute." The construction of these lines is thorough, the best of North long-distance 'phones are used, metallic circuits, and the exchanges are put up, and maintained as well, and with as prompt service as the city lines. The Bell lines cross the county, but are not allowed to maintain exchanges. While reports come that in places mutual and other forms of companies are giving satisfaction, there is no desire here from any quarter to question but that the proprietary lines are the best plan, leaving the renter of a 'phone free of concern, and giving him at really a nominal sum the best of service possible, and without unknown costs and expenses to be met. All of these company lines are owned by a few persons, and the stock is very hard to buy. One line—the Stafford—is the individual property of the constructor, and is, for the capital stock, a very valuable piece of property.

It is useless to write of the advantages of the 'phone to the country dweller, and how a 'phone once put into a house, is rarely ever taken out. The social life over the wires is a great feature to break up the far-apart element of farm life, and brings all the people into acquaintance, and often friendships, that would have otherwise been unknown. JOHN GOULD.

Ohio.

FARM NOTES FROM NEW JERSEY.

STRINGFELLOW PLANTING.—About four years ago I set a few trees of apple, pear, plum, quince and cherry, after trimming them severely, both root and branch, but they were not trimmed as much as Mr. Stringfellow advised. I was afraid to follow his instructions implicitly. They were set in the Spring, and all grew the first year. The next Spring one of the two cherry trees (both sweet varieties) failed to come out in leaf, and the other one died before Fall. All the other trees are still living, and have borne fruit. Not all of the apple trees nor all of the pear trees have borne, but the quinces and plums and some of the pears and apples have borne. Since I set these trees I have tried other trees, mostly of forest varieties, that came up where not wanted, with the genuine Stringfellow method, and they have invariably grown. I have set a walnut tree that was two inches in diameter in a hole made by a crowbar. It came up in the garden and grew there three years. Then its immense tap root and all of its surface roots—some of which were 10 feet long—were cut off, the trunk cut off below the branches and the stub jabbed into a crowbar hole. It is growing. A year ago I ordered six apple, three dwarf pear, three plum and three cherry trees through a nursery agent. They were delivered early in October. I trimmed them as closely as Mr. Stringfellow would have done, and set them in the ground without so much as watering them. The entire Fall was extremely dry, the Winter was dry cold, and the ground bare nearly all the time. One apple tree did



MAP OF THE RURAL TELEPHONE SYSTEM. Fig. 261.

not live through the Winter. All the others started to grow, but the two sweet cherry trees have since died. The sour tree (Montmorency) is still living, and has made a fair growth. The pear trees have made great growths and the other trees have done well. I believe this is the way to set dwarf pear trees, but doubt whether sweet cherries will do well by this method of planting.

CORN CULTIVATION.—I planted one-half of a nine-acre field with corn May 24, and was driven from the field by a shower. Rains continued so frequently that it was two weeks before the ground was again in good order for planting. I planted in rows, furrowing but one way. When we went to plant again the corn that had been planted was not yet up, but the weeds were making a fine start. Much of the ground was literally purple with young black-heart. Last year I used a steel-toothed horse rake as a weeder, and was well pleased with the results. I tried it on this field, but the rains had packed the ground so much that the rake wheels would not sink in the soil, and the rake did no good. Those weeds must be killed, or there could be no corn, and I plowed the field for corn. I hitched the team to a six-beam, spike-tooth harrow, and harrowed across the rows just as though it had not been planted. In a few days I gave it another harrowing. The corn first planted was then mostly up, though uneven and pale in color. It was next gone over with the horse rake, which now did a little good. A week later it was again harrowed with the spike harrow and the cultivator started. It was cultivated twice and plowed twice with a one-horse plow. I now have a very fine field of corn, but with all the "tormenting" I have given it there are still a few ragweeds and black-hearts in it. Had it not been for the harrow the corn would have been swamped by the weeds, for I know of no other practical method by which those corn rows could have been approximately cleaned. Not one hill in a hundred was injured by the three harrowings.

New Jersey. G. G. GIBBS.

THE STORY OF PLANT GALLS.

J. T. Roberts, of Syracuse, N. Y., recently sent us samples of a grapevine on which the curious growth shown at Fig. 262 had developed. Prof. Slingerland gives the following interesting account of the work of this gall insect:

Abnormal growths are not uncommon on many plants, and often they are of curious shapes. They may occur on the roots, trunks, branches or leaves of the plant, and they are often called "galls." In many cases insects are the cause of these galls, inside of which they live and develop. Children are familiar with the ball-like enlargements common on the stems of goldenrod, and one can scarcely find a leaf on an oak tree that does not bear one or more kinds of little galls; dozens of different kinds of these galls may be found on almost any oak tree. Usually the galls are named from their peculiar shapes, thus we have a curious "pine-cone" gall on willow, "bullet" and "star" galls on oak, and "trumpet," "filbert," "apple" and "tomato" galls on the grapevine. These grapevine galls are among the most striking and peculiar of insect galls. The galls found near Syracuse and shown in Fig. 262 are the "filbert" galls of the grapevine; from 10 to 40 of these galls may be found in a single cluster from one to two inches in diameter. These "filbert" galls are woolly, greenish growths, which have a fleshy, juicy, subacid interior. The mass of these galls springs from a common center at a point where a bud would naturally be found, and are thus an abnormally developed grape bud. Cut open one of the galls and a single elongated cell or cavity will be found in the center, containing a solitary orange-yellow maggot about one-eighth of an inch long. This little maggot will eventually transform into a minute gnat resembling a mosquito.

It is a remarkable fact that each species of gall-making insect infests a special part of one or more particular species of plants, and the gall produced by each species of insect is of a definite form. Hence, when an entomologist who has studied these insects sees a familiar gall, he knows at once what species of insect produced it. Naturalists have speculated much as to the way these galls are made to grow. It has been supposed that at the time the egg of the insect is laid there is deposited in the tissue of the plant with it a drop of poison which causes the abnormal growth. By this theory the difference between the galls of different insects was explained by supposing that the fluid produced by each species of insect had peculiar properties. There are certain kinds of galls which may be produced in this way. Thus it is said that the wound made by a certain sawfly in the leaves of willow causes an abundant formation of plant cells, and the gall thus formed attains its full growth at the end of a few days, and before the larva has escaped from the egg. But with gall-flies the gall does not begin to grow until the larva has hatched; but as soon as the larva begins to feed the abnormal growth of the plant commences. In this case, therefore, if the gall is produced by a poison, this poison must be excreted by the larva. There exists in many kinds of gall-flies an alternation of generations; that is, the individuals of one generation do not resemble their parents, but are like their grandparents. M. V. SLINGERLAND.

SOWED CORN FOR FERTILIZER.

On page 389 Prof. John Craig gave the inquirer, H. W. M., a very unsatisfactory answer in regard to plowing down corn. He says: "There might be difficulty in getting it well incorporated with the soil and well packed down if the season should be dry," neither of which is the case on either clay or sandy soil. I have brought up the poorest kinds of land with corn. Plow the poor land in the Fall; as soon as dry enough in the Spring lime it very heavily. Then harrow thoroughly from May 10 to May 25 (according to latitude). Sow your corn, not less than three bushels, using 200 or 300 pounds fertilizer to the acre. I prefer four bushels if sown by hand. Roll it and let go until about August 20. If it gets too large get at it sooner. After trying the usual way of getting down big clover I tried the roller same way as plowed. This put it down flat; all went under slick as a whistle. I then put it in rye and fertilized it, 200 pounds to the acre, sowed four bushels, plowed it down the last of May, plowing the same as I had the corn. My neighbors said I must be crazy for plowing down such nice rye, but it went down. I put it in potatoes; had a good crop; fertilized potatoes. Next Spring I put it in oats and seeded it to Timothy and clover, 15 quarts to the acre. We had 40 bushels of oats per acre, and the next season (the present) we cut close to three tons of good hay per acre, and the sod looks well, nicely matted all over. I wondered for years before why the plan had not been more generally tried. I intend trying another plan, practically the reverse, but I expect the same results. I have a poor field which will be put in rye this Fall, limed and fertilized; will plow it down in May, put it in sowed corn, plow it down in August, put part in wheat, and seed it. The other I may try Clark's system of seeding to grass; will know the system by that time, as I am going to try it this Fall. S. B. ARTHURS.

Pennsylvania.

WHEAT AFTER SILAGE CORN.

Where the farm land is to be kept busy all the time, and all farm land should certainly be so kept, one of the great advantages of the silo as an adjunct to the farm is in the ability of the farmer to get the corn crop off the ground in time to sow to wheat. If a clover sod is manured and plowed down for corn, or better, the manure applied after plowing and worked in with a disk harrow, a very fair start is made toward a good wheat crop. The good farmer will, of course, plow his land well for corn and work it thoroughly, giving his corn frequent cultivation and keeping the land free from weeds, so when the corn is removed for the silo, he has a clean, well cultivated surface for wheat and an ideal seed bed, after he has loosened up the ground with a good cultivator that does not disturb the corn stubs and roots being run to a depth of about two inches. Then he has the solid ground under his fine shallow surface. This is a much less expensive operation than plowing the ground after the removal of the corn, and more favorable for the wheat. The corn roots, not being torn up, are not at all objectionable in the harvesting of wheat, as the corn is cut so low to the ground that the stubble of it does not reach up to the wheat harvester knife. If we care to roll the wheat in the Spring much of the corn stubble will be entirely pressed into the ground.

When the wheat is drilled the corn rows are simply "straddled" between teeth of the drill. It is the practice here to use a drill with fertilizer attachment, and from 200 to 500 pounds of commercial fertilizer is drilled with the wheat. Frequently no Timothy is sown, and the ground seeded to wheat a second time. I think a much better plan, and one I have followed successfully, is to sow Timothy with the wheat, and clover in the Spring. I keep the young clover and weeds clipped after harvest, mow twice the following Summer and put corn in the ground the next Spring. The wheat is covered with manure during the Winter and another dressing given the young clover after the wheat is harvested. Another application of manure for the corn gives an application for each crop in the tri-rotation. This method allows active use of the land, and at the same time improves its fertility.

Pennsylvania. W. F. M'G.

A TALK ABOUT ASHES.

We are cutting pine, hemlock and cedar logs in our sawmill, and burning the refuse in our large iron burner. Could the ashes be used as a fertilizer on our garden, and would they be as good as manure? We have a large quantity, in pile outdoors, uncovered from last season. Could this be used, or has it lost its goodness?

Ford River, Mich. F. R. L.

We have so many questions about ashes that we will try to cover them in one answer. One of the best pamphlets dealing with the subject is Bulletin No. 74 of the Maine Experiment Station, Orono, Me. Ashes, as we all know, contain the indestructible parts of vegetable matter. Sometimes the combustion is not complete, so that the ashes contain small bits of charcoal or unburned wood, which add little to the value. There is, of course, no nitrogen in a well-burned ash, since that element is a gas, and is driven off by heat. The three valuable fertilizing elements found in ashes are potash, phosphoric acid and lime. The value of a sample of wood ashes was formerly measured by the amount of potash it contained, but now that the value of lime is more generally recognized, that element is considered. The value of any sample of ash will depend on the wood which was burned to produce it, and on the way it was burned. The director of the Maine Experiment Station makes the following classification:

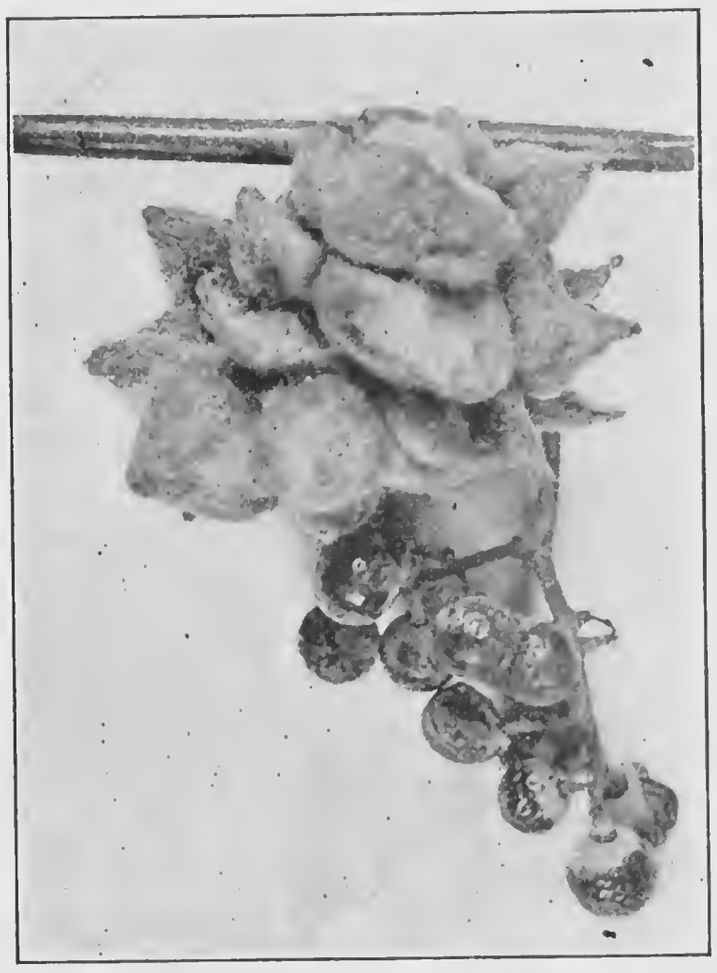
Kinds of ashes.	Potash.	Phosphoric acid.	Lime.
Unleached hard wood	8.0	3.3	36.5
Unleached soft wood (household)	2.6	1.8	23.6
Unleached soft wood (dump)	1.5	1.1	34.3
Unleached soft wood (mill furnace)	3.5	1.7	42.8
Unleached Canada	5.0	...	....
Leached mixed wood	0.7	1.7	26.5

This gives the amount of potash which is soluble in water. According to the table the hard-wood ashes are worth more than those from soft wood, but this is due largely to the way the wood is burned and the way the ashes are kept. This is shown by some experiments in Canada reported by the Ontario Agricultural College. Different kinds of wood were burned under the most favorable conditions—so that all the ash was saved and not mixed with sand. The following table shows how some of these woods compared:

Kind of wood.	Potash.	Phosphoric acid.	Lime.
Sugar maple	9.31	2.03	45.24
Oak	9.39	1.69	43.54
Birch	8.58	1.47	37.10
Beech	7.58	1.39	41.21
Apple	4.84	1.81	44.93
Poplar	10.42	2.98	28.38
Hemlock	8.73	2.76	45.83
Pine	11.22	4.03	20.28
Cedar	3.30	.98	49.06
Spruce	8.98	4.00	25.82

In actual farm practice it would never be possible to obtain pure ash, but these figures show that soft-wood ashes average well in potash, but vary in the amount of lime. Why then are soft-wood ashes, as sold, lower in potash? They are not always so, but many of them come from furnaces or mills where slabs are burned. These slabs are often covered with sand, which mixes with the ashes. The fires are usually very hot and part of the potash is actually driven off and lost, as is the nitrogen. Such ashes are not usually well kept. They are dumped outdoors in the dirt, and more or less exposed to the weather. With heavy rains some of the potash is leached out. It is probably safe to assume that the average ton of leached ashes, kept under cover, contains five per cent of potash, 1½ per cent of phosphoric acid and 33 per cent of lime. The phosphoric acid in ashes is insoluble, but the potash and the lime are both in good forms for plant feeding. As a fair basis for figuring values we may call the potash worth four cents a pound, the phosphoric acid two cents, and the lime a little less than half a cent.

Do wood ashes have any value in addition to what they give as plant food? They have a mechanical effect on soils. They bind the lighter sands more closely together, thus making them better able to hold water. The lime acts on clays to open or crumble them. The potash lye from the ashes, in solution, has power to dissolve organic matter and thus make nitrogen in the soil available. Wherever land is burned over a very rank growth is sure to follow. This is not all due to the potash left in the ashes from the burning, but because that potash helped to make nitrogen available. In direct answer to the question it will be seen from all this that the sawmill ashes will be useful on the garden. They cannot fully take the place of manure, for the latter contains nitrogen, while the ashes do not. Most garden spots are rich, and for a year or two the ashes might give good crops if used alone.



FILBERT GALL ON A GRAPEVINE. Fig. 262.

NITRATE OF SODA ON GRASS.

On page 463 of THE R. N.-Y., for July 7, 1900, Prof. Phelps advocates the use of 100 to 200 pounds nitrate of soda on grass lands, in connection with 150 to 200 pounds muriate of potash and 200 to 300 pounds S. C. acid rock. In a recent number of THE R. N.-Y. you state that Mr. Clark is now using about 266 pounds nitrate per acre. The question at once presents itself, how much nitrate of soda can be used on grass without losing a portion by leaching? Nitrate costs us 2½ cents per pound, and with hay only $10 to $12 per ton one does not like to use more of such an expensive fertilizer than the crop will assimilate, and have the remainder wasted. Would such a heavy application last until the second or Fall crop? For seeding in the Fall, is not cotton-seed meal preferable? The United States Department of Agriculture states that it lasts in the South about a year, and probably a longer period in the North. Again, Prof. Phelps states that the grass, when not grown for seed requires relatively small amounts of phosphoric acid, but does not the grass which blooms and is just forming the seed when cut for hay have practically the same demand upon it as if it were allowed to remain a few days longer to ripen the seed? F. C. C.

Maine.

ANSWERED BY PROF. C. S. PHELPS.

Nitrate of soda should always be used as fertilizer with caution. Unless there is a crop on the soil ready to take it up soon after it is applied, much of it may be lost by leaching. This again depends on the weather. Heavy rains, which soak down two or more feet, will probably carry away much of the nitrate, but many seasons the early Summer rains are light, and only wet the soil to the depth of about one foot. Nitrate is often profitable on such crops as potatoes or corn, which make little growth for a month or more after planting, but it is safer to use on grass or oats which are growing vigorously when the fertilizer is used. With hay worth only $10 to $12 per ton it is doubtful whether over 125 pounds of nitrate per acre would prove profitable. This would cost at 2½ cents per pound $3.13. We have found that nitrate of soda is often profitable on grass, especially when used on land that has been cropped several years without manure or fertilizers, and is soon to be plowed and reseeded. When land is in a comparatively low state of fertility it responds greatly to the stimulus of nitrate.

It is generally true that plants of the grass family which produce seed, such as corn, rye, oats and barley, use larger quantities of phosphoric acid than others which are not allowed to seed. When grass is cut before the seed begins to form it needs less phosphoric acid than the cereals. If cut late after the seed is fully grown more phosphoric acid is used, but even then not as much as is used by most of the cereal crops. It is generally believed that plants take up plant food from the soil as long as growth continues, and that only a part of the nourishment of the seed comes from the translocation of matter from the stems and leaves. Nitrate of soda, however, should not be used on grass in the Fall. Cotton-seed meal, fish, or tankage, with muriate of potash, are better for use when seeding grass lands.

HANDLING THE SILO CROP.

This is now one of the most important jobs of the dairyman's yearly work. It is hard work, from the cutting of the corn to the feeding of the cutter or properly packing the corn in the silo. A feeling of thankfulness comes over one when the work is well done and completed, for there is no more satisfactory food in the dairyman's bill of fare. Winds may blow, snow, rain or sleet cover the earth; there is no husking to be done with cold fingers, no moldy, wet fodder to haul in Christmas Day; no corn butts to clean out of the cow's manger or to bother one in the manure pile. It is hard work to handle silage, but who is not willing to work hard when he is accomplishing something? It is more satisfactory if one has his own cutting outfit, but this is not always practical, as silage machinery is rather expensive, and has but few days' use during the year. If one has his own outfit more time can be taken with the filling, which is sometimes quite a convenience.

Corn is late this year, and a good many will want to wait as late as possible, so if you have to hire an outfit it will be wise to watch your corn and make arrangements early, so that the corn will neither be frostbitten nor too far matured. We prefer to cut when in the milk stage. If beyond that period too much of the grain will harden and pass through the cow undigested, which is worse than wasting the best part of the food. Corn 12 to 16 feet long is heavy stuff to handle, and we should plan as far as possible to avoid all unnecessary lifting. Have low riggings on the wagon. Set the cutter or build platforms so that everything will work down rather than up. By lifting the rear end of the ordinary cutter and extending the table so it is 14 to 20 feet long the feeding will be accomplished much more easily. We tried cutting the whole field one year before starting the cutter, but did not like it. The top leaves will dry up and break off; it is more unpleasant to handle, many of the ears will get too ripe. If left in large bundles they will heat in the center. If rainy weather sets in the corn will be dirty, and decidedly unpleasant to handle. It takes more help to keep just ahead of the cutter, but it is more satisfactory.

If you are short of teams and have an extra wagon, as most farmers do, two teams will take the place of three by hauling the load to cutter and changing wagons. Pulling out the evener pin and changing to the other wagon will take but a minute. Care should be used in loading to have butts all one way, and even across the load. Begin loading at front or hind end of wagon, whichever way is most convenient for unloading at the cutter, and load as high at one point as you expect to load, then work backwards. Loads properly put on can be unloaded quickly and easily, and in at least half the time of those improperly loaded, and with much less exhaustion of patience. Feed the cutter evenly, spreading the corn from one side of table to other, so that there is a continuous uniform stream going into the cutter. Some men will require more power, and not cut over half as much corn by uneven feeding. It wants about the best man on the job at the feed table, as he can help or hinder greatly. The ordinary carrier doesn't deliver the corn in the best manner; ears will roll one way, with the heavier butts and the tops and lighter parts another. This will cause uneven settling and poor silage. One can make an A-shaped board apparatus to put under the end of carrier that will help greatly, or cutting ends of bran sacks and sewing together makes a swinging chute that can be swung all around the silo. Keep the sides well filled and tramp them hard; no fear of getting it down too much. If you have any dry corn fodder don't put it all in in one place, as it will be likely to firefang and spoil. Mix in a load with two of the green, and don't have any of it near the top.

There lies before me as I write a catalogue of a corn harvester. Every cut of the machine at work (and they are photo-engravings) shows the corn cut from a foot to two or more above the ground. This would be thought sinful waste in our section. Why throw away a good many tons that the cow will eat clean and with relish, besides making the field harder to get into shape for its next crop? We cut just as close to the ground as possible. Corn knives are cheap, and it is better to wear one out on the stones and earth than to top the corn. Don't leave the field bare all through the Winter. As soon as the corn is off we go over the field with hayrake, which picks up all the rubbish, then follow with the disk harrow, sowing rye, and finish off with the weeder. This makes good pasturage and prevents washing on our hilly soils.

Connecticut. H. G. M.

Farmers' Club.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

BEET TOPS IN THE SILO.

J. O. S., Oconomowoc, Wis.—Can you tell me what kind of feed the tops of sugar beets would make if put into the silo, and what should I pay for them for that purpose? The beet fields are from three to four miles from silo. Feed is very high here this year, owing to the drought; tame hay worth from $12 to $15 per ton; bran, $17; other feed in proportion.

We are unable to find anyone who has actually tried the tops, in this way. Here are the opinions of practical men:

It is a common practice in the old country to throw beet tops together in heaps, cover them with a little earth, and feed them as they are needed, but I can give you no definite data as to the feeding value of the tops, or in regard to the quality of silage which might be made from them. For myself, I should not venture to place a very large quantity of them together in a silo where other silage material was to be placed above them, as I should expect the pressure to force out the juices and thus greatly lessen the feeding value. There would be little risk in finishing the filling of a silo with sugar beet tops; but I should not be willing myself to haul the tops and put them into the silo for feeding purposes, or pay more than 30 to 50 cents per ton at the outside. It would not be necessary to cut them, but if they could be put into the silo easier by running them through the cutter elevating the carrier, this could be done. They probably could be handled as hay is handled, either with the hay or with rope slings. [Prof.] F. H. KING.

Sugar beet leaves may be preserved in a silo like any other green material that will settle compactly together and exclude the air. There is no need of running them through a cutter. In feeding value they would not be very different from corn silage. While containing considerably more protein than green corn they contain less total nutrients. To feed with corn fodder or straw they would be worth more than corn silage. The objection to using them for silage is the difficulty in gathering them together in large quantities without mixing with the soil, and getting them fast enough so that those already in the silo would not take harm from exposure to the air before others are added. It is doubtful whether under ordinary conditions it would be profitable to put them in a silo, but under exceptional conditions and where the distance necessary to haul them is not too great it may be advisable. [Prof.] I. P. ROBERTS.

If I was short of feed and had nothing else to put in the silo I would try the beet tops. I would not think it necessary to cut them, but should keep the outside the highest while filling the silo, and well tramped, especially around the outside. I should want the tops as green as possible; that is, not partially dried, and free from dirt or other substances, and should want to fill as fast as possible. If I could not arrange cheaply for power to elevate them to the silo I would have two large baskets, holding two or three bushels, and with a pulley and rope they could be hoisted quite rapidly; one basket could be filled while the other was going up and down. Many of the farmers near me pay from 40 to 50 cents per ton for sweet corn husks and refuse for feeding purposes, and I should think perhaps the beet tops might be worth half as much, and perhaps more, to the man who wants them. If I had no silo I would put them in pits the same as potatoes, only make the pit long, and if the soil is dry, that is where no water could get in, dig down two or three feet or more, according to the situation. Commence at one end, fill and tramp, like putting in the silo, and cover with straw or swale hay enough to keep out the dirt; then cover with soil, and when wanted for feed open at the end and uncover as needed. I am not sure that, if it was not easy to get them in the silo, the pit would not be preferable. The tops would make succulent feed, thereby giving one a chance to use more straw and other roughage. As all feeding material is to be high the coming Winter, one must resort to every available resource to procure feed rather than to sacrifice valuable stock.

Seneca Co., N. Y. A. D. BAKER.

Rye to Follow Potatoes.

C. I., Rochester, N. Y.—Have any of your readers had any experience with sowing rye on potato ground after the potatoes are dug in the Fall, then plowing it under for oats in the Spring? We have about 15 acres of potatoes on land that is inclined to be gravelly, with a very little clay in places, but not heavy. It is gently rolling, sloping mostly to the north and west. Some claim that should it be a dry Spring the rye will do more damage than good; that it will absorb moisture from the ground. My idea is to sow rye just before digging the potatoes; that this operation would cover the grain in good shape as we dig with a digger. The ground is free from weeds. We do not like to have the ground bare all Winter, and it would seem that the rye should benefit the land.

ANS.—We would like to hear from any who have tried this. We have frequently sown rye after digging potatoes, and plowed it under the following Spring before planting corn, or potatoes again. Who has tried it for oats? In a wet Spring we feel sure that the growing rye will make the soil lighter and easier to work. In a dry Spring it should be well rolled after seeding, so as to pack the rye down hard. We should not seed before digging, but dig first and then smooth the soil down with a harrow, before sowing the rye. Unlike clover, the rye will add but little to the soil. It will, however, save considerable soluble nitrogen, which would otherwise be washed from the soil during October and November.

From Raspberries to Rape.

T. S., Camden Co., N. J.—1. What is the best way to care for red and black raspberries, blackberries and Lucretia dewberries, that is, when and how to prune? They are now tied to a wire 18 inches and four feet from the ground. 2. I desire to form a herbaceous bed at side of house that will take about 14 shrubs. Will you advise what to plant for succession of bloom? I would like the foliage to be evergreen or nearly so. I could supply bloom with lilies, Cannas and Phlox. 3. I wish to plant a clump of grasses either circular, half circular or three-cornered. Arundo donax and Arundo donax variagata I would like to form the background or center. Will you advise what other grasses to use and how far apart they should be planted? 4. I have considerable outbuilding covered with tar roofing paper that requires recoating. Would gas tar do for the purpose, or would it be better to use roofing paint at 75 cents for two gallons? 5. Would it be good to give horses Dwarf Essex rape? I see it recommended for hogs, sheep and cattle, but horses are not mentioned. 6. My peaches and Abundance plums rot as soon as they commence to turn color. Can anything be done to help them for another season? 7. What do you consider a good second early smooth tomato? Stone is all right, but something is wanted earlier, and a good cropper.

ANS.—1. Cut away completely all old canes soon after fruiting. The new growth should be topped as soon as they clear the top wire. Early next Spring the canes may be thinned to two or three to a plant, and all branches cut back to two or three buds each. 2. If evergreen shrubs are desired other than coniferous varieties the choice is limited to the various kinds of box, Kalmias, Rhododendrons, the Mahernia or ashberry, and the hardy laurel, Prunus Laurocerasus Schipkænsis, though the common privet, Ligustrum ovalifolium, may be added, as it retains its foliage until January in the inquirer's latitude. If some conifers are wanted there are varieties of dwarf Thuja and arbor vitæ and the native hemlock, which can be kept compact by frequent pruning, though conifers as a rule look better when planted in a group by themselves. 3. The Pampas grass, Gynerium argenteum, the various kinds of Eulalia, and Erianthes Ravennæ, which resembles the Pampas grass, but has the advantage of being hardier, would do well with the Arundos in the grass bed. Eulalia gracillima univittata is the best of the Eulalias, and should be freely used. The above varieties may be planted three or four feet apart. 4. From our own experience with gas tar we would prefer to buy the roofing paint. 5. We have fed rape to horses as a green or soiling crop. They do not eat it readily at first, but soon become used to it. Feed little to begin with and increase the quantity slowly. We would not pasture horses on it. Of course the rape cannot be made into hay. 6. The only treatment for fruit rot, giving practical results, is to spray the trees just before the buds swell with Bordeaux Mixture, five or six pounds each of copper sulphate and lime to 50 gallons of water, again after blossoming and finally as the fruit begins to color. All applications after the leaves come out should be reduced to half strength—three pounds each lime and copper sulphate to 50 gallons water. 7. The Combination tomato catalogued by W. Atlee Burpee & Co., Philadelphia, Pa., should meet your wishes under ordinary cultivation.

Pruning the Potato Vine.

S., Barnstable, Mass.—I have a field of potatoes which show very fine tops. I am advised to cut these tops off, leaving about eight inches above ground, on the theory that such pruning will cause the plants to set more tubers and mature them. Is this sensible?

ANS.—I have never tried the effects of cutting off tops of potato plants, and so can only tell you what I believe would be the effect. It is that it will reduce the yield and size of the tubers—the amount of injury depending upon the time when it is done. The potato tuber is a storehouse of starch. The starch is formed by the green leaves. The growth of stems and leaves during the early part of the Summer is preparatory to this manufacture and storage of starch which occurs naturally during the latter half of the life of the plant. Every green leaf that is killed by bug or blight, or removed by such pruning as is proposed, during this later stage in the plant's entire development, means a proportional loss in starch production and consequent decrease in yield. I am of course discussing the potato plant as it grows under Vermont conditions. It is conceivable that these might be different in the South or Far West, but I doubt it. L. R. JONES.

The Trade in Apple "Chops."

P. E. L., Lee, Me.—There are about here quite a quantity of natural fruited apples which I could buy cheap. What is the best way for a man of limited capital to render these apples salable? Describe the apparatus and method of making the form of dried apple known as "chops?" What price per ton does the producer usually get for "chops?" Do you think there would be a demand for what "chops" I could produce?

ANS.—What we call "chops" are apples of any size, kind or color, sliced into five to eight slices (without being peeled) by hand or with machine, and dried artificially in any kind of a drier—stove, hophouse or evaporator, but to sell for full value they must be bleached with sulphur before being dried, a process now well known in every community. We can procure the chopping machine for anyone desiring to make these goods who will ship them to us for sale, or will furnish one or more to responsible persons who will pay for them with chops. Last year the price went down to $20 per ton delivered here in bags, but they are now worth $40, and may bring more in September, October or November, but they may be lower in the Spring, as the crop of wine in France is so great that the demand may be small after New Years.

THE cost by the pound or gallon is not the true measure of paint economy. Considering the cost of material and labor necessary to paint a house, *Pure "old Dutch process" White Lead* is the cheapest and, durability considered, by far the most economical, and is the only paint that will give permanent satisfaction.

The brands named in the margin are genuine.

By using National Lead Co.'s Pure White Lead Tinting Colors, any desired shade is readily obtained. Pamphlet giving valuable information and card showing samples of colors mailed FREE to all applicants.

National Lead Co., 100 William Street, New York.

The New Horticulture

BY H. M. STRINGFELLOW.

We do not hesitate to say that this is one of the most interesting books on horticulture that ever was printed. Most reading farmers have heard of the now famous "Stringfellow Method" of planting trees, but few understand clearly what it is. This book tells the whole story in clear-cut, forcible style, which all can understand. Not only is the theory of close root-pruning carefully explained, but the general principles of gardening and fruit-growing are discussed. Mr. Stringfellow is a practical gardener, and he gives his own experience. We commend the book to all without reserve. New Edition, paper covers, 50 cents.

THE RURAL NEW-YORKER, New York.

Pollenizing Northern Spy.

F. H., Ludlow, Vt.—I am grafting over some old apple trees to Northern Spy. I wish to put in buds of some other late-blooming variety for the purpose of fertilizing the Spy. What shall I use?

ANS.—I am not sure that Northern Spy is not self-fertile, but of the contrary opinion that it does not need another variety to pollenize it. However, there might be some benefit in providing other pollen than its own. Genet is one of the latest blooming apples, and its season is practically the same as that of Northern Spy. It might be a good one for the purpose desired, if its pollen proved to be potent upon the flowers of the other variety. H. E. V. D.

Setting Apple Trees.

L. B., Tallula, Ill.—Would it pay in planting an apple orchard to set the trees 45 or 50 feet apart, and plant dwarf trees between them one way, or are dwarf apples a humbug? After a man is past 75 he does not like to wait 10 years more to taste the fruit of his planting if there is anything that will bear earlier.

ANS.—It is a good plan to give apple trees plenty of room, and where they grow to very large size 45 or 50 feet is none too far apart for them when full grown. But I would plant standard trees of early bearing varieties as fillers, and not dwarfs. It has been quite well proven that dwarf apple trees are too costly and unsuitable for American orchards, but in Europe they are quite popular. In Illinois there need be nothing to discourage one who is quite aged from setting apple trees with a hope of seeing them bear. Most varieties will begin to bear within less than 10 years after planting, and some will produce profitable crops at five years. Among the latter are Missouri, Oldenburg and Wagener. These are the varieties that I would use as fillers between the permanent trees. H. E. V. D.

Fruit Questions from Virginia.

H. J. W., Pearisburg, Va.—When would be the proper time to bud peach trees in the southwestern part of Virginia? Can peach trees be successfully budded that are about the size of a lead pencil, or a little smaller? Can peach trees that are budded this Fall be successfully transplanted next Spring? If they were transplanted in the Spring, would they not be more likely to form a better system of roots, as they could be dug without cutting the tap roots? If this were done, should the stocks be cut off just above the bud at the time of transplanting? I set out some peach trees last Fall, and wrapped the bodies of them about the middle of June with newspapers to protect them against locusts. I have not removed the paper yet, as it will prevent borers from getting into the trees. Will the paper injure the trees? When should it be taken off? I have a young quince orchard that seems much affected with blight. Would it be advisable to sow the same in clover and mow for a few years? If this is not advisable, what would you consider the best treatment for said orchard? Do you think that Japan plums would succeed in southwest Virginia?

ANS.—August and the early part of September is the proper time to bud peach trees in any part of Virginia. It is better to have peach seedlings for budding, a little larger rather than smaller than a lead pencil, but almost any size will do if the work is done by very skillful hands. Small buds should be used for small stocks. 2. Yes, it is entirely practicable to transplant peach trees that have their buds in the dormant stage, and this is sometimes done by orchardists. It can be done in Virginia any time between the time the leaves fall until the time for them to start the next Spring, but I do not like late Spring planting. I do not think that it would make any material difference in the future growth of the roots, whether the trees are transplanted at one or two years old. My plan has always been to cut off budded stocks close to the bud early in the Spring, whether left in the nursery, or set into the orchard. Some leave a stump above the bud to be cut off after a few months, but this has always seemed to me only a trouble. I prefer to have the healing of the wound begin in the Spring. Paper will do no harm when wrapped about the bodies of the peach trees if left on indefinitely. It will be a benefit in keeping out borers to a considerable extent. The blight which affects quince trees is the same that is so prevalent on pear trees, and there is no known remedy for it other than to cut off and burn the diseased parts. The cutting should be well below where the disease is observable. Seeding to clover and mowing instead of cultivating would not be likely to prevent the trouble in any material degree, although it would not harm the trees in the least. Clean cultivation is usually the best course. Japan plums are now grown to some extent in many parts of Virginia. Rot is the worst fault they have there and in many other sections H. E. V. D.

Bing and Napoleon Cherries; Virgalieu Pear.

M. W. F., Bryn Mawr, Pa.—1. Will the Bing and Napoleon (Royal Ann) cherries that have won so much favor in the West and on the Pacific coast, be likely to do equally well in eastern Pennsylvania? 2. Is the old-time Virgalieu pear—the most delicious pear ever grown—still to be had of fruit tree sellers? I never find it catalogued in their booklets. At what age does it come into bearing? I only know now of old trees in very old gardens.

ANS.—1. Yes, The Bing and Napoleon cherries do very well in those parts of the Eastern States where the other sweet varieties succeed, and Pennsylvania is included within that territory. 2. Virgalieu is a synonym of the pear properly White Doyenne. It is offered for sale by some of the nurserymen, although not by the majority of them. It is indeed a very delicious pear, but it is rather more easily affected by the fungus disease that causes the fruit to crack than most varieties. H. E. V. D.

What Killed the Tree?

W. H. W., Malden, Mass.—This year we were pained by the death of a fine cut-leaved birch, which had been growing vigorously for seven or eight years. We could assign no cause. This year, another five or six years old, looks very much discouraged and we are anxious about it. It is far away from the first, 75 or 100 feet. There is no possible gas leak, and we have had plenty of rain. Can you prescribe any treatment which may save a valued life?

ANS.—It can only be guesswork to assign a cause for the death of the birch trees without careful examination. In some localities death from root rot, caused by fungus attacks, is known to occur, but trees in built-up sections usually die from the effect of gas or water about the roots, or downright starvation from poverty of the graded soil.

EVERYBODY'S GARDEN.

SWEET CORN AND SMUT.—Experience seems fully to demonstrate that smut is a serious hindrance to the profitable growing of some of the first early sorts of sweet corn. It is also pretty clearly shown that the trouble is much more prevalent with some varieties than with others. As little has as yet been done to remedy the difficulty, it is best thing to grow the varieties least affected. The Early Cory, with all its newer strains, as the White Cob, the Mammoth and Giant, while very desirable as to earliness and table quality, are all, in so far as my experience goes, particularly liable to the disease. Of all the first early kinds tested here, the Sheffield Sugar seems nearest the ideal. It withstands the cold of early Spring better perhaps than any other variety, while the table quality is second to none. It is the best cropper of all the early varieties tested by me, both as to yield of ears and fodder.

VARIETIES FOR SUCCESSION.—For a succession, which will give an unbroken supply the entire season through, the following list for most localities will be found very satisfactory: Sheffield Sugar, Early Minnesota and Old Colony, in the order named, with Stowell's Evergreen for the finish, or what is equally satisfactory, the Old Colony planted from two to three weeks later than the first planting. These varieties planted at the same time will follow each other in very close succession, and their table qualities cannot, I believe, be improved upon.

OUT OF TIME.—Our sewing machine got to playing all sorts of antics; in fact, it utterly refused to do its work at all. We could see nothing wrong, but it just wouldn't work at all. The adjuster down at the office, after looking it over, said it was "out of time," i. e., some part of the machinery failed to work at just the proper instant, with the result that it threw everything else out of joint, or disabled every other part. Applying this to the garden work, there is no more fruitful source of leakage in the profits of the work than doing things out of time, or rather, behind time. Crops planted and tended out of season, in the majority of cases, prove a snare and a delusion. Give the weeds a few days to start, and the check to the crop will never be overcome, while the soil has been robbed of moisture and fertility sufficient to have added much to the growth and profit of the crop. Success in its highest sense is only attainable by the closest possible attention to details, and keeping a crop in the best condition for growth from start to finish. The only attainable success is through setting the mark just as high as possible, and continually and earnestly striving to reach it.

HARVESTING ONIONS.—For best results, the onions should be harvested just as soon as mature, and this condition may be easily told by the necks or stems. When the tops turn yellow and wither up is the proper time for the work. Do not wait for all the tops to reach this condition, as the main crop will suffer if left standing until all fully ripen. Many of the onions will remain green and grow on indefinitely; but if pulled with the main crop, will mature perfectly. At present, harvesting machines throwing two rows together are used by some growers, but in ordinary operations the work is still done by hand. By some growers, the topping is done previous to pulling, by going through ahead of the pullers and twisting off the tops. Ordinarily, however, onions and tops are pulled and thrown four rows together and left thus to cure, and the tops are removed by sheep shears or knife when the onions are gathered. In favorable weather, the onions will cure in from eight to 10 days, but this process will be hurried by carefully stirring with a wooden rake or other implement which will not bruise the onions. In wet weather it is safest to cure under cover, on the barn floor or covered scaffolds, but always where the air will have free circulation. Large operations, of course, require special facilities for storing and curing, and lacking these and experience in the work, it is safest to market the crop as soon as possible, leaving the Spring markets to those who have experience in storing for the Winter, as the work is particular, and at best, is usually attended with considerable loss.

Why Not Add to the Certainty of Growing a Good Crop of Winter Wheat by Sowing Our "Turkish Red"

THAT always produces a good crop wherever Winter wheat can be grown? It is iron-clad and the hardiest wheat in existence; has proven of strongest vitality, given the biggest yield and best wheat in the world at every Experimental Station where tried. It has a record of 55 bushels at Iowa Experiment Station, and an average yield of 45 bushels for the past 10 years. Hundreds of farmers grow from 10 to 20 bushels more per acre this year from our seed than from best common sorts. Price, $1 per bushel, bags free, f. o. b. here. Write for **Free Catalogue** and descriptive circulars. New crop choice home-grown Timothy seed, $2.50 per bushel, sacks free. Address, mentioning The Rural New-Yorker,
J. R. RATEKIN & SON, SHENANDOAH, IOWA.

Ruralisms

NOTES FROM THE RURAL GROUNDS

A Cross-bred Cucumber.—The long, smooth cucumbers known as English forcing, grown so extensively under glass in northern Europe, have never been popular in our markets. They can be grown in frames here to great perfection on account of our high percentage of sunlight, but are too late and slow in development for field culture, even if wanted in the markets. They are so large and handsome in color and form that many attempts have been made to cross them with our popular field varieties, but so far without results of practical value. The hybridization is, of course, readily effected, as both forms belong to the same species, Cucumis sativus, notwithstanding the wide horticultural differences, but the resulting mongrels do not seem to possess the needed characteristics. Fig. 260, first page, shows a type resulting from pollinating Telegraph, one of the best foreign cucumbers, with a selected early-bearing White Spine; together with the parent forms. The specimen shown in the cut is not as shapely as the average, but was in fine eating condition when it reached the length of 14 inches. It is very dark green in color, with a few scattering spines, well filled with immature seeds, which insures it the crisp sweet flavor so much desired. The cross was made last year on the Rural Grounds, and the resulting plants grown both under glass and in the garden. They are extremely vigorous and productive, setting almost as many fruits as the ever-popular White Spine, while they attain three times the size, as reference to the cut will show. This season they are fully as early as the White Spine parent, and bid fair to outlast it in bearing. The foliage is very large and heavy, giving the vine much the appearance of the foreign seed parent. Whether these useful features will be kept up in future generations remains to be seen, as hybrids between varieties of cucurbits are notoriously unstable. The quality of the English cucumbers grown in this country is very good, but the texture of the flesh is less brittle. It is well known that they can be grown without pollination, and the resulting fruits are seedless, but most people find the juicy crispness of our own varieties, with their immature seeds, more agreeable.

Border Spiraeas.—Systematic botanists are so mixed on the genera Aruncus, Astilbe, Hoteia and Spiræa that a layman may be excused for ignoring all technical differences and clinging to current catalogue designations which have become familiar by long usage. We may conveniently call the herbaceous species Border Spiræas in distinction to the permanent shrubby kinds, no matter to what particular species they may be assigned in the latest check-lists. There are several very handsome varieties which can be grown to great advantage in any partially shaded nook in the garden. The native species, S. Aruncus, goat's beard, and S. Ulmaria, meadow sweet, particularly the double white form, are always desirable. The former has creamy white flowers, and grows about four feet high when established; the latter is pleasantly fragrant and seldom grows higher than two feet. Both flower in June. S. Japonica is the feathery Japanese species, so abundantly forced for Winter decoration. It has beautiful glossy foliage, but does not last long in perfection. It is entirely hardy, and is grateful for more moisture than it generally gets. There are several highly improved varieties, varying in the number and density of the panicles or flower heads. The varieties Astilboides floribunda and Nana compacta multiflora are very fine, and much more satisfactory than the type. The latter is especially dwarf and free-blooming. Spiræa astilboides is a fine species growing two feet high, with large plumes of white flowers. A new foreign variety, Silver Spray, claimed to be a hybrid between Astilboides and S. Thunbergii, is attracting much attention from the density and brilliancy of its flower heads, which are white, slightly tinged with pink. Palmata, the crimson meadow sweet, is still common in old gardens, where its dark red stems and crimson-purple broad panicles of bloom make a great show. S venusta is also a showy red-flowering species, not so generally grown. Both kinds grow three or four feet high in congenial situations, and are of easy culture. S. Chinensis, a beautiful species from eastern Asia, has just bloomed on the Rural Grounds, and we regard it as much the handsomest of the colored kinds. It has bold and handsome foliage, which resists heat well and sends up branching flower stems three feet or more high, covered with heavy plumes of rosy pink flowers. It is beautiful in the garden and does finely for cutting. It is quite new to horticulture, and is sparingly offered by plantsmen. S. Aruncus Kneiffi, also from Asia, has been described as superior to all known kinds, but is disappointing to us. It grows three or four feet, and has finely divided fern-like foliage, which burns and blights badly on the Rural Grounds. The feathery blooms are a dingy white instead of the pure color indicated by the descriptions. It is new, and offered at a comparatively high price. Our specimens have died after blooming each season. Probably the handsomest of the genus is the very dwarf S. filipendula, especially the form known as Double-flowered dropwort. It has very pretty dark-green fernlike foliage and numerous plumes or corymbs of double milk-white flowers. It is an exceedingly attractive hardy plant, and if we were confined to a single Spiræa it would be our choice.

August Strawberries.—By means of constant irrigation and abundant fertilization we have induced our Saint Joseph strawberries to bear a fair midsummer crop, but find that the berries, though really of good flavor, are not wanted at this season. In comparison with choice bush and tree fruits they are rather insipid. W. V. F.

APPLES FOR SOUTHERN NEW JERSEY

I wish to plant an apple orchard in southern New Jersey, and want early bearers. Is Bismarck worth planting here? What about Yellow Transparent and Starr, and are Paragon, Mammoth Black Twig, Stayman and Arkansas synonyms for the same apple? Is it an early bearer?

May's Landing, N. J. J. T. B. S.

ANSWERED BY IRA J. BLACKWELL.

Bismarck is a very dwarf grower, and would not be profitable unless planting very close. I would advise to plant only as experiment. Yellow Transparent is a fair grower, and not a tardy bearer; may be one of the best. My knowledge of this is favorable. Starr is highly recommended; personally, I do not know the apple. Paragon, Mammoth Black Twig and Stayman are seedlings of Winesap. Paragon has often been planted for the Mammoth Black Twig; very few of the latter have been disseminated. They are a stronger or heavier grower than Paragon, quite distinct in wood and growth. Stayman has fruited in central New Jersey, is larger than Winesap, and I think would be safe to plant for trial at least. Arkansas belongs to the same class. I think it synonym of Paragon, but am not sure. I would advise the planting for market, of first early, Primate, not usually a heavy bearer, but an annual bearer and sells well; Early Ripe, not so good quality as Primate, a little later and much surer to bear. Alexander is likely to be the most profitable apple; may be called second early; tart, red in color on white ground, a fine-looking apple that sells high. Must be gathered as soon as ready, as it rots fearfully when left too long on tree. At present time I find this one of the best. Haglce comes in next, a little late for an early apple, yet it grows nicely, a good bearer, and usually sells. Peaches are by this time in the market, and apples are not usually very salable.

Williams Early may precede peaches, also Garrettson. Cornell's Fancy and Maiden Blush are fine fruits. In Winter apples there is nothing that I know that will bring the quick returns so well as the Smith, generally known as the Cider apple, and it not only brings returns quickly, but it keeps right on bringing in the cash, if half taken care of. Have known this tree to bear 14 bushels at one crop 14 years planted. Nero is a very mild sub-acid fruit that is safe to plant, provided there are no cedar trees near the south side of the orchard. It is very liable to be host to the Cedar rust when near a cedar grove on the southern side of orchard. Fall Flat-top has some claims, particularly for the family orchard; good bearer, large size, best quality for every use, but it ripens a little unevenly; keeps into November here. Smokehouse, September to October, needs no one to speak for it. Rebel is a fine apple, ripens in October; color red. Hawthorndon ripens with the Maiden Blush; considerably larger, sells best, bears well; poor grower. York Imperial will outkeep the Smith. An uneven bearer—that is, bears so heavily that it has to have an off year or two. Cooper's Market will have to be left out on account of tardy bearing. After 25 years of growth in the orchard, it begins to bear the finest of apples, that keep and sell well. For a Winter apple the Smith takes the lead in early persistent bearing, and has the ability, when broken down by over-bearing, of sending up shoots to form a new top that in two years will begin to produce apples.

Grape and Rose.—Several years ago you sent us a grapevine, the name of which is forgotten. Last year it bore its first grapes. This year it is quite full, but our severe drought is keeping them very small. Last year we sacked some of them, and, when fully ripe, we thought them better than the Concord. Our Ruby Queen rose was very full of bloom. It must have had at least 40 roses on it, but they did not last as long as our other roses. We planted it near the grapevine, but must move it to some better place, as it is too fine to lose. L. B.

Illinois.

R. N.-Y.—The grape was probably the Carman. It has not been very satisfactory in most parts of the North.

Strawberries and Lime.—A few years ago I tried the experiment on an acre of strawberries on low land (muck and mud land), the kind of soil people say needs lime to sweeten it; on half I used stable manure (horse manure), the other half equal value in money of Canada wood ashes and bone. There was but little difference that I could see; if any the stable manure was best, but with my 50 years' experience, I would rather rely on stable manure for all kinds of land to grow strawberry plants and fruit. I never used common brick lime, only the lime contained in the wood ashes.

Massachusetts. S. H. WARREN.

Bordeaux on Potatoes.—Just a word on the Bordeaux Potato-blight question. We have a small piece of potatoes, about three-quarters acre, near the house. The last time they were sprayed, about a month ago, when in full bloom, Bordeaux of the 4-4-40 formula was used (four pounds lime, four of copper and 40 gallons of water), in addition to the Paris-green. The last nine rows on the upper side of the piece were sprayed *with Paris-green only*. The tops on all the rows remained green and thrifty till last week, when I noticed indications of blight on the rows not sprayed with Bordeaux. It was three days before I observed any blight on the other rows; gradually, however, the disease has spread, and now the whole piece is affected, and the tops are rapidly turning brown. In this case one rather hasty spraying seems to have been of some avail in protecting the leaves from blight. Potatoes hereabouts generally reported a poor crop. R. W. R.

Millbrook, Conn.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

HOPE FARM NOTES

STRAWBERRIES.—This season has been a hard one for most farm crops, but there never was a season yet that did not suit something. Our strawberries have made a fine growth. When at last we had a few weed-killing days in succession I told the boys to let the corn go and clean up the yellow turnips and strawberries. It was too late in the season to clean up everything, so we will take the things that have the most promise. Our Marshall strawberries are fine, great stocky plants with thick green leaves, and not a trace of blight. They have been cultivated five times and hoed three times. We got down on our knees to them the last time and pulled out the weeds by hand. They will respond to that sort of a prayer. We are leaving only two or three runners to each plant. Small families for pedigreed plants or pigs! I want big rich berries, for most of our local growers seem to have the pins set up for smaller-sized fruit. Better four good, stocky plants to the square yard than a dozen! We shall put on more fertilizer the last of August, and let them go.

SPREADING OUT.—We set 2,000 plants last Spring. We plan to leave about 7,000 good ones and to transplant 4,000 more. These transplants will be set between the late cabbage, and in or after the early sweet corn. They will be the best plants we can find. If the soil is moist or wet we shall cut around the plant, and with the fingers squeeze a good-sized ball of dirt around the roots. If the soil becomes dry the Richards transplanter will be used. This cuts down into the ground and brings up the plant with a bunch of dirt around the roots about as large as a tomato can. When this is set out in a new place the plant never stops to wink. The point is to keep the roots from the air if possible. It is, of course, nonsense to expect a full crop from these transplants next year. They will give some good fruit, however, and the following year they will be ready for a full job. As they grow between the cabbage their bill for rent of land will not amount to much before coming into bearing.

FERTILIZING IN FALL.—I believe in feeding the strawberry heavily in late Summer and Fall. The fruit buds which are to produce next year's crop are started and formed usually during September or October. Some growers believe that the crop is completed—from bud to berry—in the short Spring season. That is an error, I am sure. The fruit buds will be formed in the next 60 days, and the plant must truly "work like sixty" to produce them. It will need potash and phosphoric acid in particular. I shall use corn fertilizer on all the small fruits. Last Spring, we found, on one of our back fields, a small patch of early wild strawberries. They were unusually large, and far ahead of anything around us in ripening. Whether some bird dropped the original seed, or whether this patch ran away from cultivation, I do not know. I think, however, that there is something in that lonely patch that may mend a hole in the strawberry supply, and I shall try to sew it on. We are digging up good plants and setting them in the rich soil at the lower end of the farm, where they will be fed and tended. Perhaps civilized food will give more power to their fruit buds. What other plants should be fertilized in the Fall? The Fall grain should be fed. Where one is using chemicals I think most of the potash and phosphoric acid might well be spread in Fall or Winter provided some green crop is left to grow. On our hilly farm it would be folly to use much nitrogen in the Fall. If I were to use stable manure in the Fall I should plow it in and not leave it on top of the ground. On level land, or that with a gentle slope, this advice would not be entirely sound.

POTATO NOTES.—The potatoes are slowly gaining. The tops have been satisfactory all Summer, but the tubers would not set and grow. They are now gaining, and may make a small crop yet. I think that the chance for a large crop has passed. Still, prices this year are such that a yield of 100 bushels per acre would give as much clear money as 200 bushels in a year of plenty. . . . As to future prices I am satisfied that most estimates are wild guesses and little else. The early crop is short, and many people who often hold until September have dug too early—tempted by the tremendous price. On the other hand, good reports of late potatoes are often based on the appearance of the vines which, this year, is the poorest possible guide. Again, people will eat turnips, cabbage and boiled rice in place of potatoes when the price goes to about $3.50 or $4 per barrel. It is true, on the other hand, that thousands of barrels which in an average season would be made into starch will this year be sold as food. With all these conditions who can tell? I expect to sell all I can spare this Fall as soon after digging as possible. . . . The most promising potatoes I have to-day are those planted in a naturally wet field which was covered with stable manure. They were planted very late in June, and while the field has been flooded again and again the vines are strong and vigorous. That is a little rough on the theories of a man who has said as much as I have about stable manure and potatoes. However, digging time is a good way off yet. The actual tubers may be so smooth and large that they will stamp on every corn on the feet of my theories—or they may be so small and scabby that they will pat it on the back. It is not safe, though, to turn a theory loose without putting some sort of hobble or halter on it.

NATURAL VS. TRAINED.—I have never cared much for fast horses, but the speed locked up in the legs and lungs of our lively colt has started a new interest in trotting records. Last week a horse trotted a mile in 2:03¼. The point of interest to me is how much of that speed is natural and how much is due to training and perfect conditions. Take the same horse on a farm. Let him earn his living like any other farmer—with a turn at the cultivator or plow, or hauling a good-sized vehicle over rough country roads. As a *farmer*—without race-horse training, what would be his *natural* speed? Charlie spent several years in caring for such horses, and he says that under these natural conditions The Abbot and the other flyers could barely squeeze the mile inside of three minutes. From all I can learn that is a fair statement of what human skill can do to hasten the passage of 5,280 feet through a watch. Much the same thing probably holds true of a cow, a hog, a tree or a field of corn. There are forces at work in all of them which are capable of doing a certain amount of work when left to do it in a natural way. They will do better when given the care and training which is common among men, but their highest excellence is not natural, but a human attribute grafted or budded into them by a trained and patient mind. No, I don't imagine that I am capable of trimming 40 seconds or so off Maria's natural record. I am not going to try it, for I feel sure that the mortgage would fatten at the race track. I shall, however, try to work out the same idea in the apple and peach orchards.

FARM CROPS.—The wet weather continues. August is crowding full of dark and cheerless days, with a deluge of rain at intervals, which keeps the ground well soaked. What a growth of weeds we have! We have mowed them down on the stubble fields, but still they come. It will make a fine lot of "humus" to plow in, but I am not quite in the humor to enjoy the appearance of the farm plate when cleaned up with ragweed. I call this a poor year for the Clark system of grass seeding, for with these cloudy days and constant showers it is next to impossible to kill out the weeds. . . . I realize how hard it is to clean ordinary land of weeds before seeding. Last year we worked one field again and again, until it seemed as though every separate grain had been exposed to the sun and air. Yet, with the second growth of grass the ragweeds are coming in as if all that culture was a mere scratch on the back. . . . . The corn which was sown broadcast late in July is making a heavy growth on the field; where the Crimson clover was plowed in it is already nearly shoulder high, and of a dark green color. That will give us good horse feed this Winter. At the top of the hill we planted Evergreen sweet corn on August 6. It is growing well, and should the frost hang off as long as last year it will make ears. . . . The Crimson clover and Cowhorn turnips are up and doing. No, I do not expect Cowhorn turnips so long that a yard will not hold them. Half that length will satisfy me, though of course I shall want to know why other folks can grow longer ones. . . . . Our pear crop is fair, and picking has begun. Two years ago I put a heavy coat of hog manure on the pear orchard. Experts predicted blight, but there has been little of it, but rather a very fine growth of new wood. I must say that last year we had cultivated crops and this year rye in that orchard. These other crops must have taken the curse out of that hog manure, so that what was left proved a blessing to the pear trees.

H. W. C.

THE SHORT POTATO CROP.

The following statement, taken from the New York Sun, will interest potato growers. The views of the consumers have much to do with the demand for food:

"If the reports from various parts of the United States, notably from New England and the South, are trustworthy, the people of this country may soon have to economize in the use of potatoes or pay extravagant prices for them. It is alleged that the southern potato crop this year is a failure, that the western yield is poor, and that throughout the Middle West and in all the States north of Maryland the crop is much below the average. Indeed, of all the States prominent as potato growers, Maryland appears to be the only one expected to maintain its average of former years. It has been estimated that the total potato crop of the country for 1901 will not yield over 100,000,000 bushels, or about one-half the quantity of other years. Of course, those figures represent all the domestic potatoes that will be available for export and home consumption. Persons who in the past have heard reports similar to these regarding a scarcity of potatoes may be inclined to discredit those now current; but the prices quoted for the staple in several cities of the Union tend to show that the foregoing statements are, at least, approximately correct. In a single day of last week the price of potatoes in Providence jumped from $3 to $3.75 per barrel as the result of a large purchase by dealers in Massachusetts, where the price per barrel has reached $6. On the day following this deal potatoes sold in Rhode Island at $4.50 a barrel and $1.60 a bushel. The market for this vegetable has advanced no less strikingly in other places. In New York the wholesale price per barrel for Long Island potatoes ranges from $3 to $4, with a strong tendency upward; in Chicago and Cleveland it is from $3.50 to $4; in Pittsburg from $4.50 to $4.75, while the prevailing quotations just now in and about Buffalo are such as almost to incline intending visitors at the Exposition to carry a limited supply of potatoes with them for personal use. The only explanation of the shortage given thus far is that the weather conditions throughout the regions where the yield is most affected have been unfavorable to a good crop. These adverse conditions appear to have extended over a vast area, which includes not only a large section of the United States, but also parts of Canada which, hitherto, have produced this vegetable in abundance. Briefly, excessive heat and not enough rain when needed seem to have put the crop in a bad way; and, strangely enough, no blame whatever has fallen on the Potato bug, despite the fact that for several weeks past that little fellow has been extremely active. It is possible, therefore, that, instead of exporting large quantities of potatoes, as in former years, we shall be forced to seek foreign markets for enough of the article to supply our own tables."

How to Drain Land Profitably.
On every farm there is probably some land that could be made more productive by underdrainage. Properly drained land can always be worked earlier, and more profitably. The best and most economical way to drain is explained in the book, "Benefits of Drainage and How to Drain," which is sent *free* by JOHN H. JACKSON, 76 Third Avenue, Albany, N. Y.
ROUND TILE

IMPERIAL PULVERIZER, CLOD CRUSHER & ROLLER.

Leads Them All.
SEND FOR CIRCULARS. The Peterson Mfg. Co., KENT, OHIO.

It's Almost Past Believing
the amount of time, labor and money this machine saves you, say nothing of increased crops its use will produce.

It spreads all kinds of manure, lime, salt, ashes, compost, etc., rapidly, evenly and better than it can possibly be done by hand.
It makes no difference how hard lumpy, caked, coarse, strawy or stalky the manure is,
THE IMPROVED KEMP MANURE SPREADER
will tear it apart, make it fine and spread it just where you want it and in any desired quantity per acre. Greatly improved for 1901. Send for our new illustrated catalog, which describes improvements in detail, and tells about "How to Grow Big Crops." Catalog mailed free.
Remember that the only original and genuine Kemp Manure Spreader is the one made by ourselves.
KEMP & BURPEE MFG. CO., BOX 38, SYRACUSE, N. Y.

THE BUSINESS FARMER'S PAPER.

A National Weekly Journal for Country and Suburban Homes.

Established 1850.

HERBERT W. COLLINGWOOD, Editor.
DR. WALTER VAN FLEET, H. E. VAN DEMAN, MRS. E. T. ROYLE, } Associates.
JOHN J. DILLON, Business Manager.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, AUGUST 31, 1901

NEXT week we expect to begin a series of articles on nature study by Prof. F. W. Card. By "nature study" we mean an intelligent interest in some of the simple and common things in nature. Too many of us simply take these things as a matter of course, and never try really to understand them. We believe that Prof. Card's articles will prove a feature of THE R. N.-Y.—but they will speak for themselves.

*

As usual, THE R. N.-Y. will open headquarters at the New York State Fair. During the entire week our tent will be open, and we shall be glad to greet old friends and make new ones. The tent will be located in one of the most conspicuous corners on the Fair Grounds. It will be a good place to sit and eat your dinner, or to rest and observe the crowd. Come right in and make yourself at home. You will be welcome.

*

THE papers are well filled now with accounts of "epidemics of malaria" which are traced to mosquitoes. There is no more malaria than there ever was, and mosquitoes are no more dangerous than they used to be. We know more about them—that's all. Knowledge plunges down below the surface, and drives all sorts of disagreeable things into view. It is a good thing, for then we can fight them better. All this talk about mosquitoes will result in a sure thing—fewer of them!

*

A READER in Kansas sends us a list of 10 new subscribers and adds the following pithy postscript:

These names, except one, were secured in a few minutes by telephone. Blessed is the rural telephone!

We feel like saying amen to that! There is no doubt as to the value of the rural telephone. Some people think that they have good grounds for complaint at the way the free rural mail service is administered, but the rural telephone is always a blessing except perhaps when some creditor or unpleasant truth-teller gets on the other end. We welcome subscribers whether they come by telephone or ox team. Now that farmers are getting closer together in club or Grange we find that they are discussing and criticising the agricultural papers as never before. That suits THE R. N.-Y. exactly.

*

A FEW years ago we began to talk about the southern cow pea as a valuable manurial plant for northern farmers. Many people were at first prejudiced against this plant which, they said, is useful at the South but not suited for the North. On our own farm the cow pea continued to work like an inspired hired man, and we have kept on talking about it. Now, all of a sudden, we begin to receive good words for the cow pea. Here is a sample letter from Connecticut:

I do not wonder that you are a cow-pea crank if the plant will always get up and hustle as it has for me on this, my first trial of it. I rather think it will make me cranky, too. On July 10 we sowed a part of our lower orchard with Early Black. At this time (August 19) they stand about knee high, and look as though they were well fed and enjoying life. The soil is very deficient in nitrogen, the poorest spot on the farm, but fairly well supplied with potash and phosphoric acid. I feel sure that they could be plowed in in 45 days from sowing, and equal a good coat of manure, as every plant has on its roots from 15 to 40 of the little globules of nitrogen from the size of fine shot to that of a medium-sized pea.

A. C. I.

In Wayne County, N. Y., we found apple orchards and vineyards sowed to cow peas, and in every case farmers were high in their praise of the crop. The true value of these crops will not be realized until next season, when the surprising manurial effect will be evident. We believe now, more than ever before, that the cow pea, when its strong and weak points are well understood, is destined to change the plan of fertilizing and cultivating many orchards. By planting it in drills or hills it will permit the necessary surface cultivation, and still give a heavy yield of vegetable matter for pasturing or plowing under.

*

IN the end the short corn crop will not be such a calamity after all. Through many parts of the West the stalks and fodder will be carefully saved as never before. On some farms where, in former years, not a stalk of corn was cut for feeding, 40 acres or more of fodder will be bound and cured. If this is done once it will be done again, for the stalk, properly handled, will go a long way towards providing a substitute for the grain. In the East we feel safe in predicting that more corn than ever before will be planted next year. Hundreds of back fields and old pastures will be broken up and planted to corn with fertilizers. We have always believed that most eastern farmers should raise more corn than they now do, and if the present high prices for the grain drive them to an increase in their acreage they will be better off in the end.

*

IT hardly seems possible that there can be any apple grower in the country who does not now understand something of the situation. There is a demand even for the wild or natural fruit when made into "chops." Let no man give his apples away this year. In the East a good share of the credit for spreading this knowledge of the situation belongs to the New York State Fruit Growers' Association. It has made several accurate and thorough investigations, and has kept its members well informed. This has interested and benefited thousands of farmers who are not now members, but who ought to be. This Association has made a wonderful growth. It has already nearly 400 members, representing over 20,000 acres of bearing orchards, and new members are constantly joining. These members are live, working fruit growers who are close to the farm. The Association is organized for *business*, and it will make a vigorous effort to win the first prize offered for best collection of fruit at the New York State Fair.

*

A NEW YORK bee keeper kept 15 hives of bees in his yard adjoining the highway. They had been kept in the same situation for eight or nine years without injury to passers-by. One day they attacked and stung a team of horses which were passing. One horse died, and the other was greatly injured. A justice's court awarded damages for $70.25, but the county court reversed this decision. The case was carried to the supreme court, which has just upheld the county court. In a long and able decision the judge reviews the law covering such matters, and decides that the owner of bees is not necessarily liable for an occasional injury done by them to others. Such liability, he says, depends upon the propensity of the animal to do mischief. The bee, he says, has become almost as completely domesticated as the ox or the cow. It does not cause serious injury to persons or property from its attacks in a ratio more frequent certainly than injuries arising from the kick of a horse or the bite of a dog." This decision and others along the same line show that the bee has to-day fuller rights before the law than any other domestic animal in common use.

*

THE last Congress voted $20,000 to be used by the Secretary of Agriculture in promoting the interests of American fruit growers. The Secretary is a business man, and his idea is to increase the export trade in American fruits. As is the case with butter and cheese, he wants agents of the Agricultural Department to inspect fruit and send it abroad under a Government certificate. This certificate, he says, and we think rightly, will give a character to the fruit which it could not obtain in any other way. In order to obtain such fruit for shipment the Secretary guarantees to protect the shipper against loss. If the shipment fail to bring in the foreign market, what it would have brought here, the Department agrees to make up the difference. Some of the New York papers condemn this plan, because they say it amounts to an export bounty on fruit paid by the Government. This strikes us as a petty objection that will not stand. Naturally such shipments are more or less of an experiment. If successful in increasing our export trade it will be a National benefit. No one can expect a private shipper to stand the loss in an experiment to determine whether the Government stamp of merit on the barrel has any value. It seems to us that the Secretary is justified in offering the guarantee, and we hope that he will obtain the fruit needed to test the plan.

A FEW weeks ago we printed a discouraging letter from Virginia in which the writer told of the great depression in farm values and the general discontent of farmers. It was probably a true picture of conditions which prevail in that neighborhood. Yet, this week, we have a letter from a place about 25 miles distant which describes an entirely different state of affairs. Instead of depression and discontent we hear of prosperity and good feeling—a hopeful outlook and fair values for farm land. What makes the difference? We believe that the thing most responsible for it is the fact that in one place a live and progressive farmers' club has been maintained. It is next to impossible to measure the good which may result from the friendly intercourse and rivalry which spring up in such a club. Such organizations make better neighborly feeling, lead farmers to take more pride in their calling, and lighten the burden of life in a dozen ways. We think that Virginia farmers' club is chiefly responsible for the hopeful conditions named in the letter on the first page.

*

AT the Pan-American Exposition a company of United States regular soldiers gave a startling exhibition of battle drill. Advancing from one side of the great plaza they threw out skirmishers and slowly advanced upon an imaginary enemy. Part of them would run forward a few steps and then kneel or lie flat and deliver their volley, while another body of troops ran to their support. Thus slowly but surely, perhaps a rod at a time, they fought their way across the open field in open order, and presenting as small a target as possible to the enemy. It was a thrilling and interesting spectacle. One old soldier who stood watching it said: "If the British soldiers had known how to do that at Bunker Hill our Republic would have been set back half a century." There is much truth in what he said. The blind, stupid obstinacy of the British prompted them to march against the American sharpshooters in solid ranks, presenting a target which a blind man could hit! Had they spread out and employed modern tactics the rifleman would have lost half his power and Bunker Hill would have gone into history as a mere skirmish. There is a lesson here for farmers. Most farm organizations must spend their first years in learning to mass or act in concert. For a time they can only show a solid unbroken front, but sooner or later they must learn to work in open order, carrying the work of the Grange or farmers' club to the home and farm, and working in full sympathy with their brothers, though separated from them.

*

BREVITIES.

Ah there, Sir Thomas Lipton!
You have come across the blue
To "elevate the saucer"
With your Shamrock No. II.
Before *you* came Dunraven,
There are others yet to come
We've naturalized the cup, sir,
And America's its home.
Your boat's all right, Sir Thomas,
She is trim from mast to keel,
But our own Constitution
Has a very lively heel.
For Uncle Sam's her builder,
And his jack knife whittles close;
We're much afraid, Sir Thomas,
That you'll get another dose.
Yet win or lose, old fellow,
Here's a hand across the sea,
Let English-speaking sailors
Ever keep the ocean free.

SAVE every apple.

THE corn crop is gaining.

OH, what a season this is for flies!

POTATOES bring more than peaches in some markets.

THE vegetarian says that both fish and flesh are foul.

SOME folks are always "in hot water," and still never clean.

"AYE, there's the rub!" says the housekeeper on wash day morning!

CLOVER and turnips are popular this year for fertilizing orchards.

THOSE who shout loudest against sinners appear to be those who are without temptation.

GOD help the man whose hair becomes so gray that he's ashamed to drop his care and play.

WE hear on good authority of dealers buying apples which will cost, with cold storage, $5 per barrel by Christmas.

WE have been advised not to sow Alfalfa in the orchard, yet western New York fruit growers are putting it there. Are they right?

A NEW HAMPSHIRE reader writes: "Say, that article on plowing, page 563, is about as good an exposition of fool writing as I have seen."

WHAT a struggle the early Patrons had in trying to organize the Grange! It was years before results were visible. Then they came with a rush.

SOME large vineyardists in western New York have bagged grapes this year. One man alone used 48,000 bags. This is one of the seasons when it may pay.

THE old question comes up again this year. Is the shredded or torn silage equal to that cut squarely off with a cutter? We should say that the shredded corn is gaining in favor.

Events of the Week

DOMESTIC.—A great hurricane swept the Gulf of Mexico August 15. It struck the coasts of Louisiana, Mississippi, Alabama and Florida, from Pensacola to Grand Isle, La. In New Orleans the storm was first felt at Lake Pontchartrain in the rear of the city. The wind was from the southeast; accompanied by the highest tide ever known, 7½ feet, raised the lake 10 feet or more above the levee, and a wind blowing at the rate of 70 miles an hour drove the water over the lake shore and rear protection levees. At West End the waters were driven over the protection revetment intended to keep out the lake water. From there inland to Metairie Ridge, a distance of four miles, the water was from two to eight feet deep. Mobile, Ala., suffered severely. In spite of the great property loss, no loss of life is reported. . . . . Two men were killed and four injured by the wreck of a Canadian Pacific train at Ingolf, Manitoba, August 14. The victims were harvesters from New Brunswick and Cape Breton. . . . . At Chicago, Ill., August 17, five persons were killed outright and many others injured in a collision between a trolley car and passenger train. The motorman lost control of his car, which ran through the safety gates and crashed into the second coach of a rapidly-moving train on the Fort Wayne road. The motorman is said to be among the dead. The scene of the accident was a dangerous grade crossing, where many previous fatalities have occurred. . . . . Severe floods occurred in the vicinity of Allentown and Danville, Pa., August 17, the result of heavy rains. Half the town of Danville was under water, but no loss of life was reported. . . . . The steamer Alene ran down a pilot boat off Sandy Hook, August 17, and four men lost their lives. . . . . Three men were killed and 11 injured August 18, by an explosion of molten metal in a blast furnace at Youngstown, O. . . . . The steamship Islander, the flagship of the Canadian Pacific Navigation fleet, and the largest and fastest passenger steamer on the Victoria-Skagway route, collided with an iceberg off Douglas Island, Alaska, August 15, while on her way south with the largest number of passengers that she has carried since she was replaced on the run a few months ago, and sank within 15 minutes after striking. Her boilers exploded as she went down, killing many who were struggling in the water. The captain and 65 others were drowned. The steamer had on board $375,000 in gold, of which a small portion was taken off. . . . . Two men who were imprisoned under Lake Erie by the fire in the water-works crib, two miles out in Cleveland Harbor, were rescued alive August 19, after six days of darkness, and they will survive. . . . . The steamer City of Golconda, plying between Paducah, Ky., and Elizabethtown, Ill., was struck by a tornado at Crowells, Ky., August 19, and turned over; 16 persons were drowned. . . . . Five tons of dynamite, stored in a railroad round-house at Herkimer, N. Y., exploded from some unknown cause August 19, killing six men who were sleeping in the building The explosion caused much damage through the town. . . . . August 19, a large oil tank at Point Breeze, Philadelphia, Pa., was struck by lightning and set on fire. The fire continued to spread the following day, extending to other oil tanks, and becoming beyond control, until it threatened the whole river front. The property loss amounted to over $1,000,000, and three men were killed.

PHILIPPINES.—The annual report of Major-Gen. MacArthur, dated July 4, 1901, the day that he relinquished command of the military division of the Philippines, has been received by the War Department. Gen. MacArthur says that in the interval from May 5, 1900, to June 30, 1901, there were 1,026 encounters between American troops and Filipinos, and that the America loss was 225 killed, 490 wounded, 118 captured and 20 missing, while the Filipinos lost 2,854 killed, 1,193 wounded, 6,572 captured and 23,095 surrendered. Gen. MacArthur contends that there is no church question in the Philippines, and that under conservative procedure there need not be any trouble in disposing of the friars. He thinks that Chinese laborers are not at all essential, and that the Filipinos will work when properly paid. He recommends the gradual decrease of the Chinese in the Islands, but whether they are to be deported or not he does not say. According to Gen. MacArthur, the outlook for the future is exceedingly hopeful. He thinks that the Filipino people will, under republican institutions, become warmly attached to the United States through motives of self-interest and gratitude, but meanwhile he contends that "the molding force in the Islands must be a well organized army and navy." At a banquet in Manila on August 11, Governor Taft, speaking of the development of the Philippines, said that satisfactory legislation dealing with tariff reform must be passed at the next session of Congress, and that laws were imperatively required allowing grants of franchises and mining rights, providing for the incorporation of American banks, and prohibiting the sale of public lands and timber.

CUBA.—Chief Surgeon Havard announced August 18 that the experiments in the investigation of the propagation of yellow fever, so far as these involved the mosquito test, will be discontinued. This decision was taken because one of the non-immunes who was recently bitten by an infected mosquito died of yellow fever. The man was a Spaniard, desired to become immune, and therefore allowed himself to be bitten by an infected mosquito. Another man who was bitten is also suffering from a very bad case. Both were bitten by insects which had been set apart for the experiments of Dr. Caldas, the Brazilian expert, who has been arranging to demonstrate the alleged efficiency of a serum as a preventive against yellow fever.

FARM AND GARDEN.—The American Pomological Society will meet at Buffalo, September 12-13. It will be an unusually interesting meeting. September 12 the evening session will be held jointly with the National Bee-Keepers' Association.

The annual Summer meeting of the Wisconsin State Horticultural Society was postponed to the last week in August.

Prof. L. R. Taft has ordered the materials for three new greenhouses for Michigan Agricultural College, a rose house, a carnation house and a propagating house, which will be respectively 19 by 53 feet, 24 by 53 feet, and 7½ by 18 feet. They will be constructed with two-inch gas-pipe posts supporting iron gutters. The roof will consist of cypress sash bars and 16x24-inch double-strength glass. For growing the plants in the rose and carnation houses both solid beds and raised benches will be used. Effort will be made to have all the houses models of their kind.

The report of the census bureau shows that Alaska's total farm wealth, June 1, 1900, was $15,686, of which $2,196 was invested in live stock, $690 in implements and machinery, and $12,800 represented the value of buildings and other improvements. Buildings have been erected on nine of the twelve farms in the territory. Preparing the soil for cultivation has been the chief item of expense in opening farms, being in some instances $120 per acre. The 12 farms have a total area of 159 acres, and vegetables are the principal product. Five of the farms are only small market gardens of less than three acres. The total value of domestic animals and poultry was $2,196. Potatoes and turnips furnished the principal income from vegetables. Next to vegetables grass cut for hay and silage is the most important agricultural product. From the standpoint of income upon capital invested poultry raising in 1899 was relatively the most profitable branch of Alaskan agriculture.

The flood which followed the storm of August 18 covered 1,000 acres of onion land near Chester, N. Y., with four feet of water, and swept away 15,000 bushels of onions, which were gathered and ready for market. In Orange County the floods destroyed at least 35,000 bushels of onions. The peach crop also suffered by the tornado, fruit being blown off and trees uprooted.

All National live stock associations are requested to send three delegates each to a convention to be held at the Lindell Hotel, St. Louis, Mo., on Friday, August 30, at 11 o'clock A. M., for the purpose of conference as to the best methods to pursue to ensure the success of the live stock exhibit at the St. Louis World's Fair, which will be held in 1903.

The annual meeting of the American Oxford Down Record Association will be held at the Pan-American Exposition, Buffalo, N. Y., Tuesday, September 24; W. A. Shafor, secretary, Hamilton, O. The great sheep show at the Exposition will be held September 23 to October 5.

ODD NOTES.

During the past year Georgia farmers used over 478,000 tons of fertilizer, an increase of 66,000 tons over the previous year.

A consignment of ivory, said to be the largest single lot ever brought to New York, was recently unloaded from an Anchor Line steamer. There were 331 tusks in all, from four to six feet long. The ivory came from Africa, and is now worth about $3 per pound.

"A MODEL FARMER."—In THE R. N.-Y. of July 20 I see that S. W. Allerton poses as a practical and very successful farmer. I believe this is the same Mr. Allerton who has a large farm in this State of Nebraska situated about 120 miles north of the Kansas line, and nearly the same distance from the Missouri River, in Boone County. I have a son who lives on the east and in plain sight of a part of that farm. I usually go out there in July or August, and sometimes cross the Allerton ranch on my way to Cedar Rapids and note the method of farming. There is a great deal of Summer feeding for beef on this ranch. The pastures are extensive, the native grasses are rich, and self-feeders dot the pastures. The self-feeders are filled with shelled corn, and the cattle help themselves and grow fat. The feeding steers are brought in by the trainload, and the live beef is shipped out in the same way. I have seen some very choice beef in Mr. Allerton's pastures. Mr. Allerton is a success as a Summer feeder, but as a crop raiser Mr. Allerton is the most conspicuous failure it has been my fortune to see, and I am in my sixty-eighth year. Climate good, land new and extra rich, good crops raised all around him, I did not want anybody to tell me where the neighbor's crops stopped, and the Allerton crops began. The ranch is extensive. I have not seen all of it. What I have seen the most is at or near headquarters. The last visit to the ranch was in 1899. When the neighbor corn crop was too big to work, and was laid by, the Allerton corn was little wee stuff not much higher than one's knee. All the corn I saw on the ranch was listed in. The ground was scratched a little on each side of the corn, but the middle ground had not been touched. The middle was growing a fine crop of Foxtail grass. I don't think I should stretch the truth if I say that I saw hundreds of acres of corn crop that would not give back the seed planted to raise it. Other people raised a medium crop that year. I saw some good-looking small grain stubble that I judged had yielded a respectable crop. Some grain in the shock was more sunflower than grain. When passing through this ranch I said to my son: "This man is a success as a Summer beef maker, but a miserable failure as a farmer, and after his help is paid, the cost of tools counted, horses provided and fed, and taxes paid, then there will not be a penny for interest on the investment, and the land is growing poorer." What impudence, what stupidity, yes, dishonesty, for such a man to pose as a model farmer!

Palmyra, Neb. W. Y.

DRY IN ILLINOIS.—The past Spring was late and cold, but with about the right quantity of rain in this section. Oats were put in late; corn in good time. There was plenty of rain up to June 20; none since worth speaking of. Right here we have a fine hay crop of excellent quality, now selling at $11 to $14. Oats seem to run very uneven, good preparation of the ground having been a very great advantage this year. Corn was promising up to the time it began to "shoot," when we had a series of hot winds which killed very many of the tassels, and left but little pollen, so that the grains will, I fear, be very scattering on the cob. There is a great demand for corn binders to save the fodder, and more will be cut than ever before in this region. On this farm we shall cut 50 to 75 acres, where we generally cut none. The wheat crop was a large one, and both grain and straw promise to be a good price. Bad as the drought is here, a few miles west it is far worse. Beginning not more than 10 miles west, from there to St. Louis, 80 miles, the country is almost a desert. They had good wheat and nothing else. About July 10 I took a little trip to St. Louis over the "Big Four." Oats were four to six inches high, and too thin for a rake to get them, even if mown. Meadows were not worth cutting; pastures were eaten, roots and all. Wheat was in shock and burning up from the fires set by the railroad engines. In a run of about 30 miles I saw the marks of at least 30 fires on one side of the line. From a dozen to 100 or more shocks had been burned in each case. In many places the farmers were out watching and ready to fight any fires starting. Many thrashing machines were running, although it was Sunday, and with all this was the terrible heat, such as has never been known here before, 109 degrees at the Government station near here. For many days the hot winds blew and the heat continued, until now there is not feed enough nor water enough for the stock. I hear of one man near Alton who is killing his stock, as he has no feed and cannot sell, while feed will be so high as to cost him more to feed his cattle than they will be worth. On the other hand, from this point east, I am told things are in much better condition. A large fruit grower told me yesterday that his peach crop was cut three-quarters and other fruits much the same. Those here who held on to their corn last year will get 75 cents or more, I think. Oats are selling up to 34 cents, but wheat remains low, 60 to 65 cents. Stock is almost unsalable. Here we still have plenty of water in our wells, but cisterns are dry. We are hoping for rain. GEO. W. BLISS.

Christian Co., Ill.

CROP PROSPECTS.

In the past few weeks I have traveled over a large part of Oswego, Onondaga, Cayuga and Madison counties, N. Y., also over a portion of Oneida County, and have talked with quite a few of the fruit growers. I think that an estimate of 10 per cent of a crop of apples is high, and would estimate the pear crop at 25 per cent. Plums are also light. I think that the one thing that has impressed me above all others this Summer is the success of Alfalfa in New York State, especially in the vicinity of Fayetteville. Farmers were cutting their second cut the latter part of July, and I was in several pieces that were almost hip high, and was told that it would be cut once more in some instances. It does not seem to me that there is any other crop that can take the place of it on New York dairy farms, especially on upland. B. D. V. B.

AUGUST 14.—I have sown Alfalfa in Spring and in July; both started well, but the July-sown nearly all heaved out, and the Spring-sown did not heave much. I would not advise sowing in the Fall. Nearly everyone is crying "poor bean crop." We have about 30 acres planted early that promise now 30 bushels per acre, but some of our best farmers who raise red kidneys report in some instances a great loss from some insect or worm that cuts the stalk off. Hessian fly is working in the beans; rust and blight and the rain hurt a good many. In some fields about one-half of the vines have not a pod on. Red kidneys are in bad condition; something seems to girdle the stalk and they break over. One man here said that anyone who would give him his seed back could have his crop. CLARK ALLIS.

Orleans Co., N. Y.

AUGUST 15.—Many crops of potatoes are a disappointment. A good many are being dug and shipped at from $1 to $1.10. We have dug about seven acres, and as near as I can tell, we have averaged about 125 bushels per acre. Now they will give us 140 bushels per acre. We have sold $900 worth from less than seven acres, which means over $130 an acre. My judgment is we, or, rather, this locality, will have about half a crop. It would appear that all the later planted potatoes will not give a crop. D. C. LEWIS.

New Jersey.

AUGUST 19.—We are able to report one whole week without rain. Mornings have been foggy, but "burned off" as the sun got higher. Everybody now hopes for a fine Autumn, with sunny days and drier atmosphere. Crops are now where one can either "bank" on them or report failure. Corn is looking well as regards color and growth of stalk, and ears have set well; but there is plenty of smut to offset the good features. Still it seems that there must be more than an average yield. Late planted corn for silage is rank and fine. The potato crop now promises a very fair yield, and late planted and late sorts are still green and "toppy." Many farmers say, "All tops and few tubers," but if blight does not strike them there will be potatoes yet. Early potatoes have been marketed and the prices have ruled high—record-breaking, in fact. First diggings brought $1.75 and $1.60 in local markets. For two weeks price remained at $1.50 with good demand, and $1.25 is present price, with steady demand. Rye is mostly thrashed, with less than usual yield reported. Fields and pastures of emerald hue and good Fall feed assured. Many have cut latter crop of clover. No apples worth mentioning, and a big crop of early pears. Grapes heavy. Beans promised a good crop, but rust will dampen expectations. More Hungarian grass was sown this year in this section than ever before, and the yield has been good, but much of harvest has been wet. Prices for all sorts of garden produce are unusually high. It is a bad season for tomatoes here. Very few ripe ones, and rust has stopped further growth. Weeds are striving to smother all crops, and there will be some good bonfires this Fall. Wise farmers are buying barrels now for another year. Price is low. D. L. P.

Dover Point, N. H.

Crop and Weather Report.

During the past week the heat on the north Pacific coast has been excessive. The Middle and South Atlantic States have had heavy rains, with high winds in the South. Texas, parts of the Missouri and Upper Mississippi valleys and the upper Lake region, are still suffering from drought. Conditions are favorable in the Rocky Mountain region and California. In the corn belt the late crop has greatly improved, but nearly all of September will be required to mature it. The Spring wheat harvest is about finished. The North Dakota crop is disappointing, owing to poorly-filled heads and shrunken berry. Cotton in the eastern section of the belt has suffered from the excessive rains and wind, causing rust and shedding. Peaches in the Middle and South Atlantic States are rotting badly. The apple outlook is slightly improved in Ohio, Indiana and Illinois. Fall plowing is in progress in most of the Central States east of the Mississippi, the soil being in good condition for this work.

Woman and Home

From Day to Day.

AN AWFUL THREAT.

I won't ever live in this house no more,
And I'm goin' away, 'way off somewhere
In the dark woods! And mebby a bear
Or something nobody ever saw before
Might come and eat me up! And then,
I bet you, when
My pa has no little boy, he'll be
Sorry he punished me!

And I'm goin' to starve and not
Ever eat anything again at all.
And when I'm up with God and got
Wings and can look at my pa, and he
Comes home and sees my coat in the hall
And looks all around everywhere,
And I ain't there,
I bet he'll be sorry he punished me!

And when I'm far away
And nearly starved and can hardly stand
They might be a big, bad man come along
and say
He'd take me off to some strange land!
And then, when the people told my pa
How cruel he was, I bet he'd be
The saddest person you ever saw,
And sorry he punished me!

And when they had no little boy no more
Mamma would cry all day.
And when no little boy would open the door
For pa, at night and say:
"Hello," I bet
That's when he'd be
The saddest yet—
And I'll stay this time, but he
B-b-b-b-etter quit punishin' me.
—S. E. Kiser in Chicago Record-Herald.

*

ONE-pound baking powder cans make very good molds in which to pack ice cream for freezing. The slices cut from such a mold are of convenient size, and pretty in effect.

*

BROILED green peppers form a very desirable accompaniment to beefsteak. The peppers are cut into quarters, the seeds removed, and then broiled over a hot fire until the edges curl. A tiny bit of butter and dash of salt are put on each piece. The broiled peppers are very appetising served with corned beef hash.

*

ONE of our friends suggests that during the hot weather fruit may be cared for by simply canning it, making it up afterwards into preserves if desired. If canned with an abundance of juice some of the superfluity may be poured off and made into jelly by the use of additional sugar at any time. If canning is done according to modern methods it is the easiest of all ways of preserving fruit, involving less labor than jellies or preserves, and if possible to defer any of the extra labor until colder weather it would be a decided saving of strength.

*

MEDALLIONS of fine Hamburg with an initial in the center can now be bought for use on bed and table linen or underwear. The initial is embroidered, and the medallion is appliquéd on the article where it is to appear, by the embroidered edge. For more practical use in marking garments initial letters come on fine cambric tape, easily stitched in place. They are a decided convenience, for an up-to-date laundress who is unable to remove stains of writing ink seems to find no trouble in obliterating indelible marking ink at any time without apparent effort.

*

YEARS ago we used to apply cretonne flowers upon various articles of fancy work, sometimes with good effect, but the cretonne appliqué was often used upon felt, which was unsuitable, and therefore ugly. This work has been revived, and some of it is very pretty. Sofa pillows of denim decorated with cretonne flowers are effective, especially green denim with big pink roses or poppies. The cretonne is also used upon thin white curtains sometimes with really good effect. Straight valance window curtains of white muslin woven in stripes are finished at the bottom with bands of cretonne, with a very pretty old-fashioned suggestiveness.

*

AN Indiana man is suing a railroad for $20,000 damages to console him for the loss of his bride. The complaining citizen feel asleep on the train when on his way to be married, was carried past his station, and did not wake in time to get back the same day. A telegraphic explanation was received by the bride with scorn and contumely; she canceled the engagement by wire, and declines to be placated. If the case comes to a trial the Indiana jury will be confronted by a problem to which the wisdom of Solomon would be sadly inadequate. Not only must they decide the amount of monetary consolation due a man thus bereft of his bride, but they must also decide whether such a slumberous soul is really within the pale of legal sympathy.

*

THAT the sensible short skirt is here to stay is proved by the new Fall jacket suits now seen in the shops, which have skirts clearing the ground by about two inches. They are not golf or rainy day skirts, but are designed for street and walking costume. In addition to serge and cheviot, which are always in style, all the suitings used for men's clothes are considered desirable for these walking suits. We are threatened with a return of the plain habit back, which is the ugliest thing possible for a walking skirt; let us hope that its horrors may be mitigated a little. The postilion, which made its appearance rather shyly last Winter, is being urged again; it is a decided improvement to a very long-waisted or hollow-backed figure. There is also a tendency towards basques coming below the waist line, which have been pushed into the background for several seasons. If they come in again we must inevitably return to seams in the back of the waist, which are always something of a trial to amateur dressmakers; they have such a maddening habit of coming out crooked after being fitted.

Rural Recipes.

He ate pork chops and sausages,
And candied sweet potatoes,
His soups were full of onions and
Of garlic and tomatoes.

He ate salt mackerel and cheese,
And pastries and bananas;
And after having finished these,
He smoked a few Havanas.

And yet he oft, in mournful tones,
Was heard to ask this question:
"Why is it that I just can't find
A cure for indigestion?"
—Credit Lost.

Blackberry Pot Pie.—If you have bread dough on hand, use that, if not make a soft baking powder dough with two cupfuls flour, two eggs, one cupful sweet milk and two teaspoonfuls baking powder. Butter a deep dish, put in a thin layer of the dough, cover with the berries, then sprinkle with sugar; add another layer of dough, then more berries and sugar and a top layer of dough. Make a small, round hole in the center of each layer of dough, except the bottom one. Set the basin in a steamer and steam three hours. Serve with cream. Cherries or peaches may be used instead of the blackberries and are delicious. Bits of butter added to the fruit are an improvement.

Grandmother's Cherry Pudding.—Beat three eggs very light without separating them; add to them two cupfuls of milk. Measure 3½ cupfuls of sifted flour; add to this three teaspoonfuls of baking powder and half a teaspoonful of salt, and sift thoroughly. Make a hollow in the center and slowly pour in the liquid; mixing in the flour until you have a smooth batter. Then add two level tablespoonfuls of melted butter and two cupfuls of stoned cherries, well drained and dredged with flour. Stir well into the batter and then turn into the pudding dish or mold, cover closely and steam for three hours. The water in the steamer or boiler must boil continuously and if more must be added replenish with boiling water.

Apple Pan Dowdy.—Butter a deep, brown earthen pudding dish; peel and slice apples enough to fill it; for two quarts of apples, use a teaspoonful each of powdered cinnamon and salt, half a pound of brown sugar, half a pint of cider or water. Thoroughly mix the spice, salt and sugar upon the apples and pour the water or cider over them. Cover with a plain pie paste, place in a moderate oven and bake slowly for three hours, taking care that the oven is not hot enough to burn the crust. This may be eaten hot or cold, with sugar and cream.

Meat and Potato Pudding.—Boil the potatoes as for mashing, rub through a colander or put through a press; make into a thick batter with milk and beaten eggs, cut underdone roast beef or steak into rather large pieces, and lay in bottom of the dish; then a layer of batter; then more meat; seasoning well; more batter, and so on until all is used, having top layer of the batter. Bake a nice brown in moderately hot oven.

Stewed Beefsteak.—Cut a round steak weighing two pounds into pieces the size to serve. Dredge each piece well with flour; put into a stewpan with a little vegetable oil and brown on both sides; then add two dessertspoonfuls of good vinegar, sprinkle each piece with salt and pepper, cover closely and place the stewpan where the meat will cook at a gentle simmer for one hour. Remove cover, add one small onion sliced, a small carrot, a small turnip and one cupful of hot water. Cover and let simmer for two hours longer. Take up the meat and keep hot, skim off any fat that may appear on top of the liquor; add to the gravy such sauces and catsups as you may have that are suitable, Worcestershire sauce and mushroom catsup preferred. Rub all the vegetables you can through a sieve, add to the gravy and thicken with a little browned flour. Season to taste, let boil up and pour over the meat. A pretty border for this may be made by pressing plain boiled spinach into small cups or molds, filling about two-thirds full, then turning them out, flattening the tops and placing a slice of hard-boiled egg or sliced beet, cut into fancy shapes, on each mold.

Cabbage au Gratin.—Remove without breaking six of the outside leaves from a head of cabbage and cut up the remainder in small pieces. Put on to boil in cold salted water and when the whole leaves can be pierced with a broom straw strain them from the pot and arrange them around the sides of a baking dish as a shell to receive the creamed mixture. When the rest of the cabbage is thoroughly tender drain well and mix with one pint of cream sauce to which has been added one-half cupful of grated cream cheese. Turn into the baking dish, sprinkle the top with a little grated cheese and bread crumbs and put in the oven long enough only to brown lightly. This mode of preparing cabbage is delicious and will be found quite as delicate as the more expensive cauliflower.

HARLOW N. HIGINBOTHAM Of Marshall Field & Co.

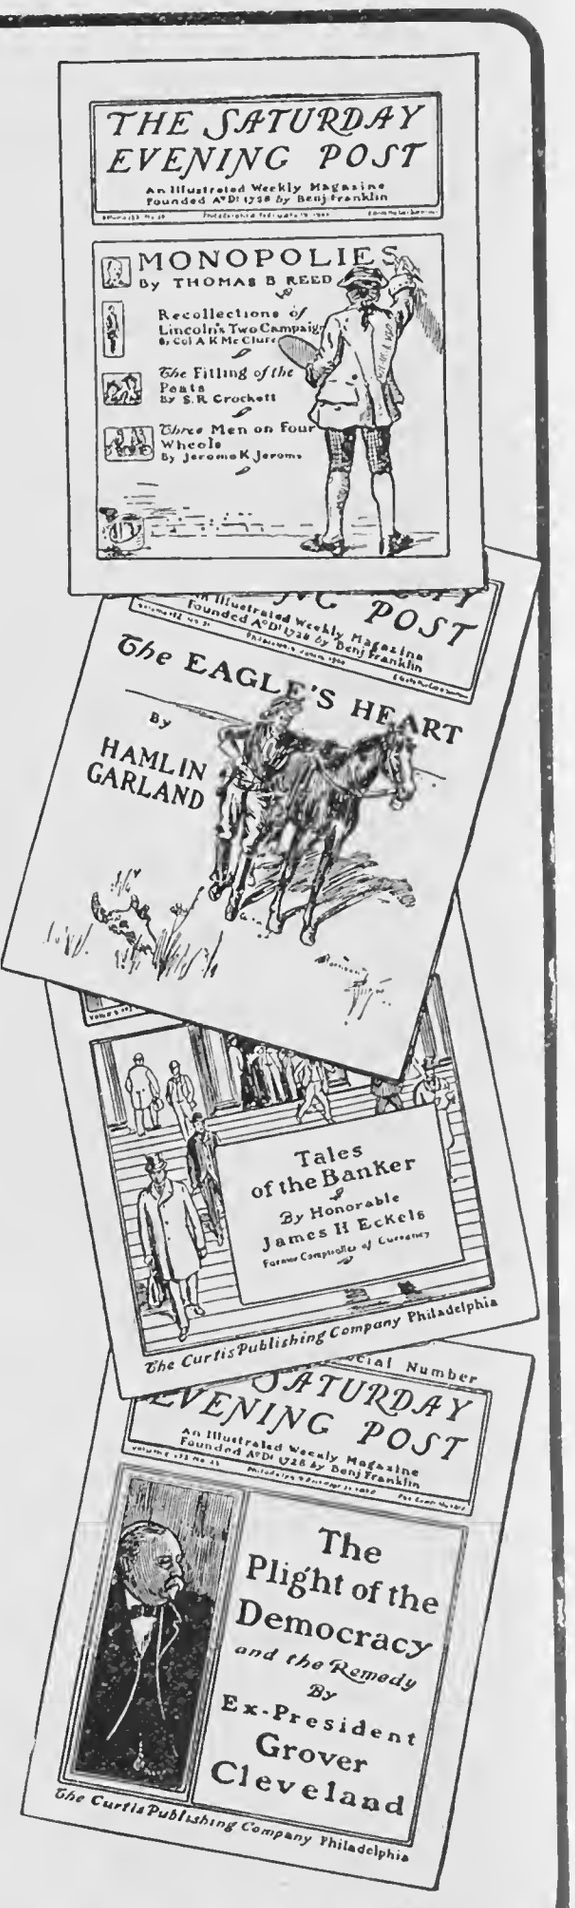
The End of the Deal, by Will Payne. A story of love and business which vibrates between the Chicago wheat pit and an old broker's pretty daughter.

A Most Lamentable Comedy, by William Allen White. A four-part novel dealing with the game of politics in Kansas.

The Fire-Fighters, by H. E. Hamblen. An exciting series of stories of the life of the old volunteer firemen who ran with the machine before the war.

Tales of Old Turley, by Max Adeler. Six new stories by the author of "Out of the Hurly-Burly"—the first humorous work he has done for twenty-five years. A country town just before the war is the scene.

The Diary of a Harvard Professor, by C. M. Flandrau. A new series of deliciously clever little tales in which the author of The Diary of a Harvard Freshman views college life through the spectacles of Professor Fleetwood.



The Curtis Publishing Company, Philadelphia

The Cow Cure.

I was so surprised that I actually tumbled off my wheel and stood staring like an idiot till Elsie brought me to my senses by asking if I could not speak to her. You see it was three months since I had seen her, and since we had broken off our engagement. It wasn't any lovers' quarrel, you understand. We thought just as much of each other as ever, and it almost broke our hearts, but her health gave out, and she thought, and in fact I did too, that she was going into a decline. She had doctored and tried this, that and the other, till finally we both gave up in despair, and she declared that she could never marry me. Well, at about that time her uncle Jason, who has a farm out about 50 miles, wrote her to come and visit him and he'd undertake to cure her. It was nearly June, and the thought of the country was very inviting, and she decided to go. I know she did not expect to come back alive, and I didn't have much hopes, either, so our parting wasn't cheerful. She told me not to write to her, as the sooner I forgot her the better, and all that. Well, the next few months were not very happy, I can tell you.

One day I got a letter from Uncle Jason. In it he said, "I think if you can come out within a week, Elsie will be able to see you." You can imagine what a state that put me in. I expected I'd find her dying. Uncle Jason went on to tell me how to come, and I'd better bring my bicycle and ride from the station on that, and he gave me minute directions about roads. Well, I started early the next morning, and it was a little after 10 when I was spinning along the road towards the farm. Then, all at once, as I said, I tumbled off my wheel.

There, by the side of the road, sitting on a camp stool with a book in her lap, was Elsie. Near by was a big red cow lying down and chewing her cud. She had on a halter with a long rope, and Elsie had the end of the rope in one hand. All this was surprising enough, but the change in Elsie was the most surprising of all. The last time I had seen her she was a thin, pale, nervous wreck, but now she was the picture of health, with her eyes bright and a healthy, sunburnt color in her face. I didn't ask her then what had made the change, for you see we had more important things to discuss first. In about two minutes we were engaged all over again, and we even began to make some plans for the wedding.

Just then that cow got up and began to move off, and Elsie, in the most matter-of-fact way in the world, gathered up her camp stool, put her book in the Boston bag she had beside her, and started to follow the cow. They went along to a new piece of grass where the cow began to eat, and then Elsie opened the camp stool again and sat down. I had watched the performance in amazement, and when Elsie looked up at me, she laughed.

"Do you see any difference in my looks?" she asked. "Do you remember what a wreck I was before I came here, with 'nerves', insomnia, dyspepsia and all sorts of aches and pains? Why, now I am as well and strong as anybody. I sleep nine hours every night, I can walk 10 miles and not get overtired, and just see this," and she drew her sleeve tight and doubled up her arm to show the biceps muscles.

"I see," I said. "It is wonderful! But what has done it? Uncle Jason ought to start a sanatorium."

"It is the cow cure," said Elsie soberly, "and it is a great discovery." Here the cow moved on again, and Elsie followed.

"There!" she said. "I'm going to tie her to this tree while I tell you about it I don't think Uncle Jason will care just this once, and she does interrupt so." When the cow was tied, she began.

"I had been here a week, and I was as miserable as ever, for all that I could see. Uncle Jason watched me closely, and seemed to be worried, but he didn't say a word. Finally one night at the supper table, I said, 'Well, Uncle Jason, I don't seem to have improved under your treatment. I've been here long enough to show some improvement, but I'm not a bit better. I haven't any appetite, I don't sleep, and I'm tired all the time.'

"His face had been troubled and he appeared to be thinking deeply, but he didn't answer. Pretty soon he looked up and his face cleared suddenly. 'I have it,' he said. 'You see I didn't understand the case thoroughly at first,

3880 Girl's Sailor Suit,
4 to 12 yrs.

and I thought that just simple country living would be all that was necessary, but I see now that you need something more radical, and I'm going to try the cow cure on you.'

"'The cow cure?' I said. 'What do you mean?'

"'Wait till to-morrow,' he said, and I couldn't get another word out of him, except that I must go to bed early and get all the rest I could."

Elsie paused and looked at her watch. "Why, it is dinner time," she cried, and she immediately opened the Boston bag. She seemed surprised. "Do you know?" she said, "I have been worrying almost ever since you came about dinner. I knew I should have to divide with you, and I didn't see how I could stand half rations with my desperate appetite!"

"Well, if that isn't a compliment!" I said. "I guess I'll go home."

"No, don't," she cried, her face coloring deeply. "I know I'm horrid to think of such a thing, but you know, Fred, I'd share my last crust with you, and I never would have let you know, only, don't you see, Aunt Lucy has put in twice as much dinner as usual, so there's plenty for us both. I wonder how she happened to do it. She must have been thinking of something else."

"She knew I was coming," I said, and then I told her about Uncle Jason's letter.

Elsie's eyes filled. "Isn't he lovely?" she said. "He knew that you were all that was necessary to my complete recovery."

"Now go on about the cow cure," I said, when we had eaten our dinner. The cow was chewing her cud, now, so Elsie went on without interruption.

"The next morning after breakfast, Uncle Jason said it was time to begin the new treatment. He took me out in the yard. 'Here,' he said, 'is a cow, and here is a camp stool. Along the road is plenty of feed which is going to waste. The cow is gentle, so you need not be afraid of her. Let her feed along as she pleases, but don't let her get into anyone's fields if you can help it. Oh, and here's some lunch for you. If you can't manage to bring her back, I'll come and get you towards night.'

"With that he set me adrift. The cow took me along at her own sweet will. I'd sit awhile on the camp stool, and then I'd have to get up and follow wherever she choose to lead. Once I had a hard struggle with her, trying to keep her out of a field. A boy happened along and helped me. He looked at me curiously, and asked if that wasn't one of Torrey's cows, and I thought he regarded me as either a thief or an escaped lunatic.

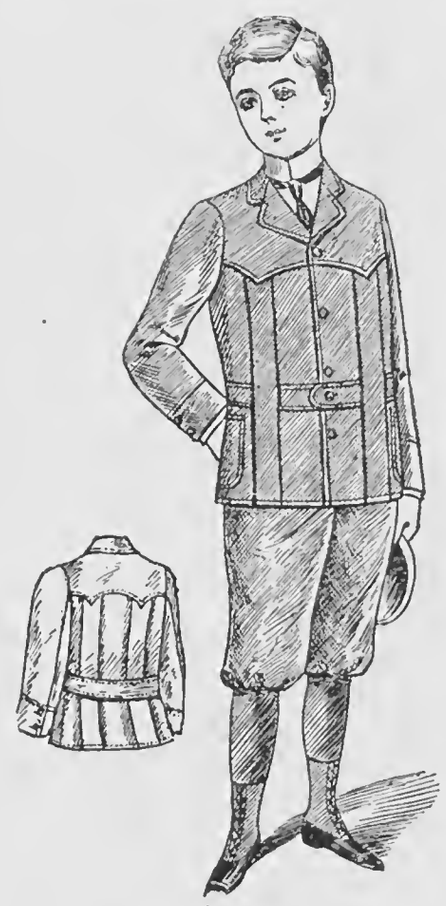
"Well, somehow, watching that cow eat gave me a fearful appetite, but the parcel of lunch was so small that it didn't seem as if it would be a drop in the bucket. I didn't have time to open it, the cow kept me so occupied, till she lay down and began to chew her cud. Then I undid the paper and found—what do you think? Four rather small, hard, oatmeal crackers. I felt so hungry and abused that I could have cried. I began to eat, and then it struck me that I would chew each mouthful as long as the cow chewed each mouthful of her cud. It worked beautifully, and made the crackers last a long time.

"Well, that was an awful day. I couldn't get the cow home. She would start in the right direction, and then her mood would change and she would go the wrong way in spite of my pulling with all my strength.

"Finally, at about five o'clock, Uncle Jason came and led the cow home, and I plodded along after them. Oh, how tired I was! Uncle Jason wouldn't let me eat much supper, and then I went right to bed. I slept like a log all night, and in the morning I felt better than I had for a long time, although there were lame spots all over me.

"Every fair day since then I have gone out with the cow. Gradually they increased the size of my dinner, and for a month I have been allowed to carry a book. I began to be able to control the animal, and now I can make her do as I like.

"I have tried to make Uncle Jason let me give up taking her out, but he would not hear of it. I told him I felt so lazy and shiftless, spending my time that



3898 Boy's Norfolk Suit,
4 to 12 yrs

way, and he said I'd have to feel that way a long while before I'd be cured of the insatiable desire to be busy every minute, which I had acquired by living in the city.

"But now"—and a look of determination came into her face—"I'm going to declare myself a graduate of the cow cure." She rose to her feet. "You may take the bag and the stool, Fred. Come along, Betsy Jane." And with that we all started.

She turned the cow in at the lane bars, and then we went on to the house. Uncle Jason met us at the door. Elsie went up to him and put her arms about his neck. "You are the best doctor and the best uncle in the whole world," she said. "And, Fred," she added, looking down at her clothes, "you must visit with Uncle Jason awhile, and when you see me again I shall not be a person of 'bovine flavors,' as Dr. Holmes used to say," and with that she disappeared inside the house.

SUSAN BROWN ROBBINS.

The Rural Patterns

The sailor suit shown is of marine blue linen with collar, cuffs and shield of white stitched bands of the blue, and tie of soft blue silk. The skirt has a front gore joined to wide, straight back portions that are laid in three box pleats on each side, and is attached to a fitted body lining. The blouse is smooth across the shoulders and can be made with or without the applied yoke. An elastic inserted in the hem at the lower edge regulates the fullness and allows of drawing the blouse over the head without an opening in front. The sailor collar is seamed to the neck and the shield is faced on to the body lining, the standing collar finishing it at the throat. The sleeves are in bishop style with straight cuffs. To cut this suit for a girl eight years of age, 5½ yards of material 27 inches wide, 4½ yards 32 inches wide, or 3¼ yards 44 inches wide will be required. The pattern No. 3880 is cut in sizes for girls 4, 6, 8, 10 and 12 years of age; price 10 cents from this office.

The Norfolk suit, as here shown, is one of the latest modes for little boys and growing lads, and will be much seen in the early Fall. The original is made of cheviot in a mixture of brown and tan with threads of green, but all wool suiting cloths are suitable for cold weather wear, linen, duck and galatea for Summer suits. The knickerbockers can be gathered into bands below the knees, as illustrated, or drawn up to the required size by means of elastics run through the hems. The jacket is made with a smooth yoke, that is pointed at the lower edge and finished with a collar that rolls over with the fronts to form lapels. Below it the jacket portion is laid in box pleats and a belt passes around the waist under or over the pleats as desired. The sleeves are in coat style, and a patch pocket is stitched to each front below the belt. To cut this suit for a boy of eight years of age 4¾ yards of material 27 inches wide, 2½ yards 44 or 50 inches wide will be required. The pattern No. 3898 is cut in sizes for boys of 4, 6, 8, 10 and 12 years of age; price 10 cents.

Preserving Corn.

For a number of years I have put down corn in the following manner, and it has always proved excellent. Fill wash boiler one-third full of water, when hot put in the ears of sweet corn (Country Gentleman is the best for the purpose I ever used) which have been husked and all silk taken off. Let boil just long enough to set the milk—no longer. Take out in pans and soon as cool enough cut kernels from the cob. Sprinkle a layer of salt (just so you cannot see the bottom) in a three-gallon stone jar; fill in the corn for an inch, then two handfuls of salt. With potato masher pound well; then put another layer of corn, never over two inches in depth before using the salt, pounding down well each time. When jar is full cover with salt just so you cannot see the corn. Place a clean white cloth over, then a plate, and weight with something; it will make its own brine, and if kept under the corn will not mold. When wanted, take out quantity desired and pour hot water over; pour off, doing this two or three times, the last time let stand until fresh enough, but if rightly handled only a few minutes are required. Boil a few minutes and the corn is ready for seasoning and table. I often put red kidney beans with the corn, and it makes a dish that even a New Yorker thinks excellent. Of course the beans are well cooked before being mixed with the corn, and a cupful of cream is the best seasoning. I tried laying down corn without cooking it first, as a recipe published directed. It soured and had to be thrown away, but after using the recipe given I have had no trouble.

MRS. FREDERICK O. JOHNSON.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

HAY IN NEW ENGLAND.

Turf, Farm and Home, published at Waterville, Me., has the following account of the farm operations of Mr. Fred Pollard, who sold a business in a town and bought a farm on the Kennebec River. This was two years ago and the farm was then sadly neglected. Now the reporter says:

"While a good crop of hay was harvested last year it was nothing compared to what will be gathered this season, and Mr. Pollard estimates that the good work has only just begun. He says he shall not be satisfied with anything less than 35 tons this year, and that is just one-third of what he expects the farm to cut in the immediate future. The most gratifying part of this all is that it has been brought about without the expenditure of a large amount of either capital or labor. In fact, with the exception of haying time, Mr. Pollard has only had one boy, but this boy has been largely employed in hauling dressing from the stables in Waterville and Fairfield. Mr. Pollard made arrangements with the livery stables to furnish them with their straw for bedding, and to receive their dressing in return, and the result has been very gratifying. The coarse strawy material has had a splendid effect in breaking up the rather heavy clay soil of the farm, hence the great yield of hay. It was thought by some that Mr. Pollard paid a good price for a run-out farm when he purchased it, but he will readily sell hay enough off the place after wintering a good stock to pay every dollar of the purchase price in a few years."

The Springfield (Mass.) Republican describes the grass grown by Major W. F. Pond, of Massachusetts, as follows:

"The grass is five feet high, is very thick, and will yield four tons to the acre, which is saying a good deal, as the average in Massachusetts is about three-fourths of a ton to the acre. The grass that Major Pond is growing almost exclusively is Herd grass, as it yields more than most kinds, and is ready to be cut 60 days after planting. Major Pond the other night took a reporter out to his field and showed him some of the hay. He lays his great success in growing grass for hay to the fact that he uses much more and richer manure than most farmers. He said: 'If the farmers of Massachusetts used more brain and less hand work, they could accomplish what I accomplish every year on this 36-acre piece of land. The main weakness of most farmers is that they let their money stay in some of the Worcester banks, instead of buying lots of manure and fertilizing the land as they should, and then they wonder why they cannot get large crops of hay. I expect and will get 100 tons of hay off this small farm, and if anyone doubts this he can come at any time and I will convince him that what I say is correct.'"

ANGORA GOATS.—I recently saw a herd of 420 Angora goats, which a man in this county has brought up from Texas. They were all in one field, and attracted considerable attention. It is supposed that they will live on bushes, weeds and such stuff that nothing else will eat. They were browsing on willows and other bushes, some standing on their hind legs to reach for the branches. The prices asked for them run from $5 to $10 each. I can't see that they are any better than sheep, except for their disposition to browse, as they might clear up a neglected farm or piece of new land.

M. D. H.

Columbia Co., N. Y.

When there is frequent "hawking" of mucus, hoarseness, a hacking cough, or corresponding symptoms, more serious pulmonary troubles are to be apprehended. Dr. D. Jayne's Expectorant will remove such obstructions and effect a permanent cure.—*Adv.*

Horses, Cattle, Sheep and Swine

$2 Book for $1

We have yet some copies left of a lot of slightly shelf-soiled books of **Horses, Cattle, Sheep and Swine,** by Curtis, that we will mail postpaid as long as they last for $1. This book is the standard work on live stock. It is used as a text-book in almost all agricultural colleges, and is indorsed by all leading authorities on live stock. It is a large book, fully illustrated, and requires 16 cents to pay postage alone. These copies are in condition for any library, and will be reserved for subscribers alone. They will not be sent at this price to dealers. They are a great bargain at the price for anyone who wants to make a study of animal husbandry.

THE RURAL NEW-YORKER, NEW YORK.

MARKET NOTES

HEAVY SUGAR RECEIPTS.—During the month of July, San Francisco received from the Hawaiian Islands 33 vessels containing 739,000 bags of sugar, equal to 88,680,000 pounds. This is the largest recorded receipt for any one month at this port, and gives some idea of the development of the Hawaiian sugar industry.

PACIFIC COAST VEGETABLES.—The general farming districts of California are having an unusual demand for vegetables. Usually the Central West does not have to buy potatoes, corn and similar products from other sections, but the drought this year has cut everything so short that the most unexpected calls have been made on the East and extreme West. California farmers are rapidly marketing their potatoes, of which there is a large acreage in the Sacramento Valley, and yields are said to be heavy. In the same section there are over 60,000 acres of beans.

NO WASTE.—"No," said an extensive New York egg dealer, "we don't throw away anything now. A few years ago, when eggs spoiled, they had to be dumped into the garbage cart, but a class of foreigners has come into this city who are genuine scavengers, and will buy eggs, no matter how badly rotten they are. The grade quoted as 'Inferior culls' at about $1 a case is far from prime, but we have sold to these people eggs so badly damaged that they brought only 25 cents per 30-dozen case. Of course, in ordinary seasons we don't have many spoiled eggs, but the excessive heat of this Summer has damaged a good many lots from a distance that were all right when shipped. I don't know what these people do with the spoiled eggs. Probably they are used in the cheap bake shops."

WHAT ABOUT POOR VARIETIES?—Every species of fruit has varieties that are worthless grown in certain localities, and some are of no account anywhere, yet they hang around the markets year after year. In small markets varieties that are unusually early or good shippers, even though inferior otherwise, will doubtless continue to be sold, as they come at a time when little fresh fruit is on hand; but in the larger markets these black sheep of the fruit tribe are being crowded out more and more each year. In New York, for example, there is always high-quality fruit of some species to be had at a moderate price. The prime apple season is a long one, lasting from the time the better Fall fruit comes until late Spring. The fancy orange overlaps the next vacant space, and then come strawberries, peaches and grapes, each for a time being king of the market. Pears, plums, cherries and berries, while important in their way, are seldom seen in quantities that exceed other fruits. Thus it happens that there is no time of year when prime fruit of some kind cannot be had. On account of the great number of buyers, dealers in large markets can keep a much larger and more varied stock than those in small towns. With this constant supply of fine fruit it is not strange that buyers, as they become familiar with inferior varieties, pass them by; and, as this practical education of the buyer goes on, he will certainly become more and more discriminating. Those going into fruit culture, who expect to ship to the great markets, should give this question of varieties a careful study before planting. That many have done this is evident from the receipts each year. Those who do not may find themselves with plantations of the fruit of which will have to be sold at a heavy discount or peddled out in small markets where the buyer has less good fruit to pick from. Again, this constant supply of prime fruit of some species is a damper on the sale of out-of-season fruits that are not prime. For instance, there are grapes in this market at present, which, while not of good quality, would sell readily at fair prices if it were not for the abundance of fine peaches. Buyers prefer good peaches at a moderate price to poor grapes at a premium. To this rule there is one great exception, the strawberry. Certainly no one can say much for the quality of the small, hard, knotty, ill-flavored strawberries that come from the extreme South in Winter, yet they sell at high prices, largely to make a display on hotel tables. For this purpose the most firm varieties are planted, regardless of quality, on account of their superiority in shipping. However, many of the early California berries received last Winter were of much better quality, and, in fact, as palatable as the later home-grown fruit.

W. W. H.

GEORGIA HORTICULTURAL SOCIETY

The annual meeting of the Georgia State Horticultural Society convened at Milledgeville, Ga., August 7-8, President P. J. Berckmans in the chair. Owing to the railroads having refused free transportation to the members of the Society the attendance was smaller than usual, only about 100 members being present. However, the refusal of the railroads to grant free transportation did not have any influence upon a number of the absentees, as the members from north Georgia were prevented from attending on account of being in the midst of their peach shipping, the season being from a week to 10 days late this year. The sessions of the Society were held in the Baldwin County Court House. The room was decorated with magnificent specimens of palms and ferns; many of the specimens would do credit to any first-class professional florist. The plants were all grown by women of this thriving town. The Mayor of Milledgeville, Hon. Julius A. Horne, made the address of welcome, and was responded to by H. A. Matthews and W. D. Hammock on behalf of the Society. Then followed the address of President Berckmans; he gave a practical talk, and laid particular stress on the denudation of our forests, and urged that some legislation be taken to prevent the useless and reckless cutting away of our forest trees. He also impressed upon the fruit shippers the necessity of using a uniform package in the shipping of their fruit, careful and regular packing. Prof. H. B. Bulst, horticulturist of Winthrop Normal and Industrial College, Rock Hill, S. C., followed next with an address on horticulture in our schools.

The afternoon session was opened by a talk from J. P. Fort, of Mt. Airy, Ga., upon insectivorous birds. This was followed by a report from the State Entomologist, Prof. W. M. Scott, showing upon the map of the State of Georgia the distribution of the San José scale, and saying that in every instance where the scale had been discovered in the State it had been vigorously fought and sprayed with kerosene, and is under full control, and in some orchards which were badly infested two years ago they have succeeded in almost totally eradicating the scale. This demonstrates that when the scale is fought according to the directions given by Prof. Scott the fruit growers need have no fear of its getting beyond their control. The brown rot is more to be feared than the San José scale. The night session was a most interesting one, Entomologist Scott and Assistant Entomologist Fiske giving most comprehensive lectures upon noxious and beneficial insects, these lectures being illustrated by a beautiful series of lantern slides. The morning session, August 8, was opened by a discussion upon pecan culture, which is becoming a very profitable industry in the South. This was followed by a discussion on brown rot, which was very disastrous to the plum and peach crop in certain sections of Georgia this year. In many instances where Bordeaux Mixture was used the fruit crop was saved, but in other instances spraying with Bordeaux seemed to have no appreciable effect upon the brown rot, but it is thought that if these cases where the brown rot was severe were investigated, we would find that spraying was not properly done.

The following officers were elected for the ensuing year: President, P. J. Berckmans; vice-presidents, B. W. Stone, James Cureton, R. E. Park, H. M. Starnes, Dr. Neill McInnes; secretary and treasurer, L. A. Berckmans. Macon, Ga., was selected as a place of meeting for 1902. A committee on legislation was appointed, this committee to go before the Legislature and ask for an additional appropriation for the entomological department, the present appropriation being inadequate. A committee was also appointed to draft a bill to prevent the destruction of insectivorous birds. The display of fruit and vegetables was very small, but the specimens shown were of superior quality.

L. A. B.

Wayne Co. (N. Y.) Fruit Growers.

Wayne County carries the banner in the New York State Growers' Association. It has a large State membership, and has also a vigorous County Association. It is easier to organize and carry on such things in Wayne County than in most other sections. Farmers have been educated in the benefits to be obtained through organization. The Grange is very strong. The farmers' institutes are well attended, and lecturers of National reputation have gone through the county carefully. Wayne County boys have come to the front at the Cornell College and Experiment Station, so that farmers have been brought close to these institutions.

All these things helped to make the field meeting of the Wayne County Fruit Growers' Association a success. Something over 400 people gathered at the fruit farm of B. J. Case, of Sodus. The day was warm and cloudy, but there was no rain and, in the afternoon, a light breeze from the lake made the air comfortable. Before dinner the fruit growers inspected the orchards and vineyards. Mr. Case has a fair crop of fruit—grapes being the best His peaches are light, but apples are fair. Everything was in apple-pie order, and special interest was taken in the experiments under way with cover crops. In one orchard cow peas are making a fine growth. Mr. Case says he is much pleased with this crop, and he expects next year to sow it in drills through the orchard, so as to cultivate thoroughly as long as he can get through the vines. When cultivation stops his plan is to go through with a roller and crush the vines down so as to make a soft place for the apples to fall. By using one of the trailing varieties this rolling would not be necessary. In other orchards combinations of Crimson clover, Alsike, Alfalfa and turnips have been sown, and were just coming up.

Dinner was furnished by the ladies of the Methodist Church under direction of Mrs. Case. After dinner the company drew up their chairs in a shady place on the beautiful lawn fronting the house, and listened to talks by H. W. Collingwood and Prof. M. V. Slingerland. The latter is very popular with the farmers of Wayne County. He started as a farm boy, and understands what the farmers need. The meeting was a great success and will help to bring the farmers of that section closer together for mutual benefit.

POSTAL CARDS.

Destroying Milkweed.

A. M. H., Toledo, O.—Milkweed, or Asclepias, is a deep-rooting, perennial plant, and rather difficult to eradicate. The only sure way seems to be to pull up or cut off the plants every time they appear above the soil, giving them no breathing spell, and in time the roots will starve out. The work must be thorough in order to be effectual. Tea plants can probably be procured from Dr. Chas. N. Sheppard, Summerville, S. C.

Greenhouse Sub-irrigation.

G. C. S., Somerville, Mass.—Greenhouse sub-irrigation has not been reduced to a practical basis. The most successful plan so far seems to be to bed two-inch tiles partially in cement, leaving the joints open near the top. They should be at least eight inches under the soil in which the plants grow. Lines of this tile placed 30 inches apart have proven quite effective in irrigating soil. Many think, however, that it is necessary to provide an absolutely water-tight basin, in order to receive the full benefit, as the water will not always rise to the surface if it can make its escape below.

Root-Knot Disease in Vegetables.

J. L. N., Cocoanut Grove, Fla.—The root-knot disease in eggplants, beans, cabbage and other vegetables is usually caused by eel worms, or nematodes, minute transparent worms, or some kind of fungus. There is no known sure remedy for plants after infection, the most promising plan being to put three or four drops of bisulphide of carbon in a hole near the roots of the infected plants, filling immediately with earth. This is at times fairly effective, but, of course, an inconvenient remedy. The best plan is probably to grow plants on uninfected ground. The largest variety of hothouse grape is probably Gros Colman.

A FIELD meeting of the New York Fruit Growers' Association was held at Olcott Beach, Niagara County, August 14. The attendance was between 300 and 400. Among the neighboring orchards visited were those of W. A. Sawyer, G. H. Bradley, L. M. Bradley, F. M. Bradley, Geo. L. Potter, S. M. Davis, Dr. C. A. Ring, W. T. Mann and E. A. Coates. Addresses were made by President L. T. Yeomans, W. T. Mann, Prof. John Craig, S. D. Willard, J. S. Woodward and H. E. Van Deman. Speakers from other States were: J. W. Stanton, representing the Illinois Horticultural Society, and W. H. Blodget, of Massachusetts, who spoke on the need of good varieties and proper packing for market. The report of the Committee on Fruit Statistics and Marketing emphasized the need of great care in obtaining reliable figures and a better knowledge of market demands on the part of the shipper.

KILLING WITCH GRASS.—I have had much experience with Witch grass (we call it wild rye), but I never saw a spring-tooth harrow, and have often wondered what they are made for. I do not believe they are any use on light or mellow land—free from stones. That is the kind I am used to. I will tell how I cleaned out a patch last season. It was mellow land, plowed in the Spring, and was a wet edge. As it was infested with Witch grass I reserved it for late planting, and worked it with Planet Jr. horse hoe with hoes set to turn in or cover. That would set the land up in ridges. Then in a few days I would put a 15-inch flat steel in the rear and cut those ridges again. I do not want the roots torn out; I simply want to stifle them by cutting every leaf two or three inches under. Beans and cabbages were planted July 2, and not a trace of Witch grass was seen during the remainder of season.

Women Wonder Why

They are doomed to so much suffering. But are they doomed? Is not the suffering the result of conditions which under skillful treatment might be entirely cured? Thousands of women who had been great sufferers, have learned that suffering was unnecessary after using Dr. Pierce's Favorite Prescription. It heals diseases of the delicate womanly organs and banishes the headache, backache and other aches which are the consequence of these diseases.

"Favorite Prescription" is absolutely a temperance medicine in the strictest meaning of the term. It contains no alcohol and is free from opium, cocaine and all other narcotics.

"*I wrote you for advice* February 4th, 1896," writes Mrs. Loma Halstead, of Claremore, Cherokee Nat., Ind. Ty. "I was racking with pain from the back of my head down to my heels. Had hemorrhage for weeks at a time, and was unable to sit up for ten minutes at a time. You answered my letter, advised me to use your valuable medicines, viz., Dr. Pierce's Favorite Prescription, 'Golden Medical Discovery,' and 'Pleasant Pellets,' also gave advice about injections, baths and diet. To my surprise, in four months from the time I began your treatment I was a well woman and have not had the backache since, and now I put in sixteen hours a day at hard work."

Sick women are invited to consult Dr. Pierce by letter free. All correspondence private. Address Dr. R. V. Pierce, Buffalo, N. Y.

CLARK'S DISK GANG PLOW

Sizes 2 to 8 feet wide or more for horse or steam power. TRASH CUTTER. perfect turner, light draft, strong, durable and cheap. *Made Only by*

THE CUTAWAY HARROW CO., Higganum, Ct.

Send for Circulars.

WELL DRILLING Machines

Over 70 sizes and styles, for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.

WILLIAMS BROS., Ithaca, N. Y.

Gold-Shell Rings.

Most people like a nice ring. We show three styles. These are made by drawing a shell of gold over a rod of composition metal. They are better and will wear longer than solid gold rings of a low carat. The retail price would be from 75 cents to $1. We will send one of these rings postpaid as a reward for sending one new subscription at $1. Cut a slip of paper the size of finger and send for size.

A Carving Set.

Every family needs a carving set three times a day. This set consists of a Sheffield carver with eight-inch handmade

steel blade, buckhorn handle, fork and steel. Price, $1.90; or we will send it for a club of two new subscriptions at $1 each and $1 25 extra money, or free for a club of six at $1 each.

Live Stock and Dairy

DAIRY NOTES FROM CONNECTICUT.

HOT WEATHER NOTES.—Pasture feed getting scant, flies abundant and water not always handy and plentiful will cause the cows at this time of year to drop off in their yield. Grain is high, and many are tempted not to feed any. Nothing has been done about giving the cows green fodder, and things are a little discouraging. It is only a short job to spray the cows once a day; perhaps not so often if you are fortunate enough to get the right fly killer. That ends one of the troubles. See that the cows have plenty of good water. If necessary drive them two or three times a day where if they have any inclination they will have to drink. Cows will not go far out of their way these hot muggy days to get water, even if they need it. Happy is the man who has conveniences for giving them a good supply twice a day at the barn. Perhaps after harvest is a good time to put in such a plant that, unlike a good deal of farm outlay, is useful every day in the year. It need not be expensive. Fix them so a small stream is running all the time; then there is no stagnant water and less liability to freezing in Winter. Look over carefully any systems that may be in your vicinity. If you put in water basins have all main pipes as much as possible on straight line, and avoid short joints, as where water flows slowly the pipes are more likely to clog. Put basins back of manger where cows can easily reach, instead of in the manger, where they fill more quickly with grain, hay and silage. Whether to feed grain now or not each must decide for himself. We feed the year around, though a limited quantity in early Summer. We think cows keep in much better condition and do better throughout the year when grain is fed. If not fed now, and insufficient food, either in quantity or quality is fed, they will get in poor physical condition and will be unable to respond later to better feeding in a profitable way. Grain promises to be high this season, and it behooves the farmer to be more careful than ever of what he buys if he gets what he pays for. Many will be tempted to buy the cheaper grades of oat feeds, etc. We notice they are being quoted more frequently now, and more brands. We let them severely alone. They are too much like late-cut hay, a good filler of the cow but not of the pail. We can hardly conceive of a time when they would really be economical. The gluten feeds and meals, cotton-seed meal and oil meals are much cheaper, though first cost is much higher.

POOR GRASS.—Adjoining our farm there stood, June 25 to July 1, one of the finest pieces of grass to be seen in this neighborhood. It was still standing there August 5, but some changes had taken place. It was on early moist land. The grass had gone to seed and browned thoroughly; weeds had come in and were having their own way. Instead of 2½ or three tons per acre of choice hay containing five to six per cent digestible protein and fat, and carbohydrates as easily digestible, there is a tough dry mass of fodder that "will feed" as some farmers say. It has lost not less than half its digestible protein that some one will have to make up for later at five to 20 cents per pound at the feed mill. The easily digestible carbohydrates have changed to coarse indigestible crude fiber. It isn't palatable, and will never be a good milk-producing food. The cow would get about as much goodness out of a dirty dishrag, and would perhaps like it better. The owner of such hay may tell you, as we have so often heard, that "it will do for young cattle and dry stock," but that is one of the big mistakes that too many farmers make. They expect calves to grow (often without any grain) on this kind of hay, and turn out profitable cows, but they will not do it. You are only cheating yourself when you try it. Calves, to make profitable cows, should be fed food that will keep them growing constantly (without fattening) from birth to maturity. This kind of hay turns out poor miserable scrawny runts that are ghosts of the dairy cow. If you expect your cow while dry to grow a good calf and do profitable work at the pail when she comes in, don't make her depend on this kind of fodder. Don't worry about milk fever if you do. You can't cheat the cow. But was there any real necessity for not having choice early-cut hay?

KEEP THINGS CLEAN.—In spite of all the preaching about cleanliness the average dairyman doesn't practice it very hard. Unless he is in direct touch with the particular consumer he is not apt to be scrupulously clean. Recently we had occasion to draw off the cream of several patrons of a neighboring creamery run on the gathered-cream style. Most of them use the Cooley system. We could not help observing the amount of sediment in the bottom of some of the cans; enough in some unfavorably to bacterialize all the cream at the creamery. If cream is dirty and full of sediment when cows are at pasture night and day, one can imagine the product turned out in Winter, when the cows are stabled all the time. One patron uses separator, but has no proper conveniences for cooling the cream and no ice, though a good ice pond is less than a quarter of a mile away. His cream will keep sweet only a few hours, and never can compare with cream properly cooled and kept in ice water. The creamery that receives the cream from these and many more patrons doesn't make top-notch butter, and cannot, because it doesn't get the right cream to do so. It ought to be one of the most important duties of the creamery manager to make frequent inspection of barns, creameries and contents, and to see that strict cleanliness is observed, but this is not done. They seem to think their work done when the butter is sold and bills are collected, but one part is as important as the other, as the makers of the higher grades of butter can secure the better class of customers, where it is not so hard to collect the bills as to sell the goods.

H. G. MANCHESTER.

Starting With Sheep.

I am thinking of raising sheep. I have 25 acres of new land, about 14 acres under cultivation, the remainder timber and growing up to underbrush. Will it pay to keep sheep, and if so, how many can I keep? What kind is the most hardy and profitable? My land is just medium as to fertility, and a little wet Spring and Fall; is mostly loam and little sand, and quite frosty. Give all necessary advice, for I know but little about farming, and nothing about sheep. How many would you advise to start with? S. E. G.

Blairs Corners, Pa.

With but slight knowledge of farming and none of sheep, you will have an opportunity to experiment. Sheep should serve you well on the land you refer to, and the expense of 10 ewes this Fall will not be great. They will certainly very greatly assist in cleaning up the 11 acres you refer to. You should, if possible, consult some sheep-growing neighbor, and get him to assist you in buying the sheep. I should recommend yearling, high-grade ewes, of the medium wool class, of Shropshire or Oxford type. I judge your land to be fairly level and suited to this class of sheep, which are inclined to be quiet in disposition and suited to low ground, if not too wet. One could buy such sheep in many stock yards of larger-sized towns and cities, and a fairly intelligent butcher should be able to purchase them for you if you wish. The total cost of these ewes, at this time, ought not to be over $4 or so a head, the way prices on sheep are now ruling. What you want are good, uniform, stock ewes, that are perfectly vigorous and healthy. You can easily determine whether they are yearlings or not, for if they are the two middle front teeth of the eight on the lower jaw will be noticeably larger than the other six. If the sheep is two years old, she will have four teeth of larger size in the middle. Two new large teeth come in each year, until eight large ones occupy the lower jaw. There are no upper front teeth in the sheep. So look out and do not get imposed on with old sheep. Then it will pay you to buy a fairly good ram to mate with these ewes this Fall. Such a ram, for your purpose, can be bought for $15, and you can use him two years. Buy a yearling, get one of good size, weighing at least 225 pounds, with the wool thick on the body and hind legs, and covering the face as much as possible. Let the ram run with the ewes, and he should be turned with them by October 15. I suggest breeding the ewes, as much more profitable than keeping stock to feed only. Then the increase in lambs should pay for the keep of the flock, and a nice profit besides.

If at all practical, you should keep your sheep up in an enclosure at night, provided mongrel dogs are very common near the farm. Dogs kill many sheep in a year. In fact, in certain sections of the country dogs are the chief obstacle to successful sheep husbandry. If the sheep are put in a shed at night, they can be fed and also protected. About a pint a day per head of a mixture of equal parts oats, bran and corn will make the sheep thrive and keep in fine condition in Winter, and when suckling lambs. When on good pasture and not suckling lambs, no grain is necessary. If you take up this enterprise, you will no doubt find helpful sheep notes in THE R. N.-Y. from time to time.

C. S. PLUMB.

Good Grain for Young Pigs.

Which is the best pig feed, barley, rye or oats, for young pigs to grow bone and muscle? L. B.

Tallula, Ill.

Any one of these feeds will make good feed for young growing pigs. If you, however, will grind the oats, they will make, after being sieved, the most valuable feed. If you can use the ground oats with skim-milk, you will have a first-class growing combination. When the pigs get to weigh 40 pounds or so, it will not be necessary to screen the oats. Barley is also a superior feed for young, growing pigs. This grain is a staple feed in Europe, to produce a high-class bacon. The barley should be ground, however.

C. S. PLUMB.

Horse Owners Should Use
GOMBAULT'S
Caustic Balsam
The Great French Veterinary Remedy.
A SAFE, SPEEDY AND POSITIVE CURE.

Prepared exclusively by J. E. Gombault ex-Veterinary Surgeon to the French Government Stud

SUPERSEDES ALL CAUTERY OR FIRING

Impossible to produce any scar or blemish. The safest best Blister ever used. Takes the place of all liniments for mild or severe action. Removes all Bunches or Blemishes from Horses or Cattle.

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, Etc., it is invaluable.

WE GUARANTEE that one tablespoonful of CAUSTIC BALSAM will produce more actual results than a whole bottle of any liniment or spavin cure mixture ever made.

Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE LAWRENCE-WILLIAMS CO., Cleveland, Ohio

Newton's Heave, Cough, Distemper and Indigestion Cure. A veterinary specific for wind, throat and stomach troubles. Strong recommends. $1 per can. Dealers, mail or Ex. paid. Newton Horse Remedy Co. (Y) Toledo, Ohio.

Breeders' Directory

JERSEY BULL
Yearling—registered, from a great show cow; almost faultless, by a producing sire Farmer's price. R. F. SHANNON, 907 Liberty St., Pittsburg, Pa.

123 HOLSTEINS all ages, for Sale
DELLHURST FARMS, Mentor, Ohio.

FOR SALE—PUREBRED HOLSTEIN-FRIESIANS. Two registered Bulls, ready for service. Above from best families. Write for breeding and prices. W. W. CHENEY, Manlius, N.Y.

Holstein-Friesian Bull
ready for service, and a fine lot of Bull Calves. Best of breeding, and from deep producing families.
C. K. RECORD, Peterboro, N. Y.

FOR SALE—Thoroughbred HOLSTEIN-FRIESIAN CATTLE of the best families. Also, 30 high-bred Bulls at reasonable prices. Write the MAPLES STOCK FARM, Binghamton, N. Y., WM. ROOD, Prop

BERKSHIRES—Best quality and breeding. Imported sire. Ohio Farm, Le Roy, Ohio. M. L. & H. H. BENHAM.

Reg. P. Chinas, Berkshires and C. Whites.

Choice Pigs, 8 weeks old, mated not akin. Bred Sows and Service Boars. POULTRY. Write for hard times prices and free circular.
HAMILTON & CO., Rosenwick, Chester Co., Pa.

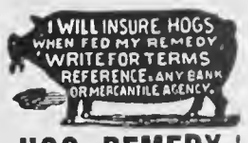
Cure Barren Animals
THE LOSS SAVED IS CLEAR PROFIT.
Others Cure their Animals. WHY BUTCHER yours? Thousands of cows, mares, sows, etc., restored to breeding in the past 20 years. The best stock farms in the world are our patrons, why not you? ABORTION: Every cow that aborts should be treated with this remedy. You cannot afford to experiment, profit by the experience of expert breeders. Treatment by mail, $1.10. Other remedies just as reliable. Ask for circulars any way.
MOORE BROS., Veterinary Surgeons, Albany, N.Y

Save Your Pigs!
Runts are Unprofitable; Dead Hogs a Total Loss.



DR. JOS. HAAS' HOG REMEDY
Is Guaranteed to prevent and arrest disease, stop cough, expel worms. Increase appetite and growth.
Send $1.25 for trial package, postage paid. Cans $12.50 and $6.50; packages $2.50. State number, age, condition, food of hogs. *Special advice free.* 25 years experience. "Hogology" pamphlet and testimonials free.
JOS. HAAS, V. S., Indianapolis, Ind.

Free for a Club of Four.

Here are 44 first-class tools for repairing shoes, rubber, harness and tinware. We are going to give no arguments why you should have them. The reasons and uses are apparent to every one. There is nothing like mending a hole, putting in a stitch, or driving a nail in time. It

always saves time and money. It often saves lives. The price is $2 alone, but it need cost you only $1. Send us one new subscription with $1, and $1 extra—($2 in all) and we will send you the outfit complete, or we will send it to you free for a club of four yearly subscriptions at $1 each.

DAIRY AND FARM NOTES.

Taking a Vacation.

VACATE THE FARM.—Can a dairy farmer, or, in fact, any other farmer, afford to take a vacation? A quarter-century ago such an innovation was a pretty sure indication of approaching insolvency. The frequent days of "visiting" when the gossip of the neighborhood furnished recreative material, the indulging at the "corner store"—have given way, in the up-to-date community, to a discussion of principles and methods of farm practice, and to the current events of the day. It all means that farm practice and economy call for more active nerve and brain force and less of the muscular energy of earlier days, and it is just this nerve force that makes agriculture successful. Is not the farmer, then, who uses during 12 months of the year this same vital force employed by the professional and business man, entitled to a vacation—a couple of weeks in which he can forget the demands of feeding and breeding, of plant foods and crop growth, and the endless detail of everyday work?

TIMES CHANGE.—I suppose the reader will query what place has such stuff in an information column of dairy and farm notes. Formerly I would have said that it had no legitimate place, but my mind has changed upon this subject as upon many others. This idea calls to mind an experience several years ago at Margaretville, Delaware Co., in which I answered a question on handling cream in a manner that called forth a sharp criticism from a listener who observed that I had given a different answer two years ago at the same place to a similar question. It also gave an opportunity to discuss change of mind and sentiment, which should be indicative of growth. Yes, a vacation for rest is a good investment, not only for health but financially, because a sharp keen mind is a safeguard against a relentless competition, which is to be sharper and closer each year.

HARD TO GET.—After all it is more easily said than done; to get away during the busy season is a sacrifice, and particularly is this true on a dairy farm, where mouths must be fed and milking done twice a day. It comes to be a question therefore whether this vacation may not as well be taken in the Winter, when time is not so valuable, and a trip to the city be made instead of a sojourn in the mountains, which the city people so thoroughly enjoy. As I write the eye can take in the beauties of Seventh Lake, Fulton Chain, and the lungs fill to their utmost with an air pure and vitalizing that so thoroughly oxidizes the system that one can almost eat and digest the proverbial rubber boot. Again this same natural tendency to equalize, and we find Nature, over a vast tract that is not crop producing, and where commerce and mercantile exchange cannot take place, preparing men and women by the thousand to battle with the modern agencies of civilization with a stronger arm and clearer brain.

AN EDUCATION.—I firmly believe that this city vacation may not only be made recreative but educational beyond the first conception of the reader. One of the crying needs of the day among farmers is a more general and also definite knowledge of market demands. I was recently discussing this question with W. H. Blodget, a large dealer of Boston and Worcester, a former resident of our town, who but recently addressed the fruit growers of western New York upon the subject of marketing fruit. Mr. Blodget, very pointedly said that "you farmers need education in packing and handling farm products for market." I could not dispute him, because I well remember a first city visit about 21 years ago, and to my then great surprise, other people were really making better butter and cheese and putting it on the market much more attractively. I had not been privileged to see outside of a narrow radius, and if there is any one thing that will grow conceit it is a narrow vision. This first visit was followed by others of a similar nature, and soon I found that opportunity for study and investigation of market needs and quality of products was not at my end of the line. Then another surprising thing developed. These same city people seemed to know just what they wanted, and frequently how it was produced. To-day there is no questioning the knowledge of a good business man; he comes in close contact with the consumer, and he is the final arbiter in these matters. Another false notion in the country is that farm products lose their identity as soon as they leave the farm; a most mistaken notion. I have known deception to be practiced in the country by people who were not naturally dishonest, in fact, they were reputable citizens, and given to square deals who had such a false notion on this matter that they would cover or attempt to do so, imperfections in their goods, only to have them rejected in the markets, and with the usual condemnation of dishonesty or unfairness on the part of the city dealer. It is to overcome this so oft repeated difficulty that I advise every farmer to set apart annually one week and sufficient of his crop returns to visit the city and get recreation and profit.

THE WIFE'S SHARE.—Take the good wife, for she is usually the equal, and not unlikely the best of the team. Woman's intuitive judgment rarely forsakes her; she may not be well informed in commercial phrases, but she knows the right and wrong of good or poor packing, and when she sees another package with better appearance she does not fail to recognize it, and to appropriate its significance for her own welfare. Yes, take a vacation, wherever you choose, but see to it that the results are for your improvement directly or indirectly. Do not dissipate; there are a thousand ways of dissipation—waste of energy and vitality from which no one profits—but the recreation that changes scenes, puts new thoughts in the place of old ones, that gives us a broader and more comprehensive view and conception of creation and its manifold laws and blessings is a Christian duty, whether we come from town or country, whether we produce the material or traffic in it. So God speed the American custom of taking a vacation.

H. E. COOK.

CLEAN VS. "CONTAMINATED" MILK.

Is there danger in the use of any of the different sprays now on the market to reduce the worry and torment of that pest, the Texas fly? Not being satisfied with my experience in this line with kerosene alone, as a spray for my cows, I have been inquiring of those who have a line of customers they supply with butter the year round. They have used other mixtures, but made the application after milking, and as the cows then went to pasture, they could not see where any bad effect could result from such applications. These men were farmers who have a line of customers whom they supply with butter at 25 cents per pound. One of them supplied a hospital for four months at 20 cents, the other eight months at 25 cents. From their customers they had received no complaint, nor had they lost any. I also conferred with the proprietors of three large creameries, who have a retail trade and supply some of the best houses in Utica, who do an extensive business with the best families of said city, and they failed to report the loss of a customer on account of any "queer" taste or flavor. Those who used the spray previous to milking claim that windows and doors being open, there was small chance for milk to be affected while they were milking, but still did not deny that it would be safer to apply the remedy after milking, as we practice the feeding of silage afterwards. These facts coming from good and trustworthy sources, were also good pointers along the line of purer, better and more wholesome production on the part of the farmer. As all dairy sections now practice milking the year round, if it is possible to affect the milk deleteriously by the use of kerosene or any of these other mixtures, what must be the effect of the milk being produced in badly-ventilated stables, cows lying in their own filth, and breathing an atmosphere laden with all the smells such vicious surroundings could produce? But when you find a farmer who so far forgets himself and his duty to his cows, and his customers, you will find that there are no educators like THE R. N.-Y. or any of our many agricultural papers on his table; that he simply exists, and, as a creamery man said to me "brought anything that would help to make the contents of his can weigh." It is no excuse for a farmer that he is poor, and can't afford the comfortable surroundings of his more prosperous neighbor. A man can wear a patched and ragged coat, but it is not necessary that it be dirty. One or two men in a community of 25 or 30 can furnish leaven enough to leaven the whole lamp. Educate the farming community up to the highest possible standard of clean, wholesome production. Then, with the best of goods on the market, we shall have gained the support of the consumer in our just fight against oleo, skimmed cheese and the adulteration of milk after it leaves our hands. J. E. H.

Some Indiana Fodder Crops.

Have begun cutting and feeding the second crop of Alfalfa for the season from a two-acre patch. This was sown a year ago last April, with an equal mixture of Red clover and Alfalfa seed. It yielded a fair cutting early in June this year, but it consisted mostly of Red clover, as that variety seemed to thrive better than the Alfalfa during the cool cloudy Spring. At this cutting there is about an equal amount of Alfalfa and Red, but a very slim cutting of the two combined. I have been reading the comments of THE R. N.-Y. on the Alfalfa patch as a cheap bran factory, but as yet I am not very enthusiastic over this bran business, for with two cuttings I estimate that I have not got more than 1,000 pounds per acre of Alfalfa hay. The soil is rather dry, gravelly loam, strong in lime, and produced (my renter says) 36 bushels per acre when last in wheat. With this estimate the bran product might be slightly in favor of the Alfalfa, but the bread and straw would easily balance the account in favor of the wheat crop. However, Alfalfa is said not to get to its best until the third year, and I shall give it one more year of grace before condemning it with a plow. All stock seem to eat it readily, and the cows never need to be driven home, when they are expecting a feed of it in waiting.

I have also grown rape, cow peas, Soy beans and sorghum in a small way for three years, but sorghum is the only one that has won my enthusiasm. Peas, beans and rape do fairly well, but the weeds will get all of them if you don't watch out. I have sown sorghum on the richest and also the poorest land on the farm, gave it no attention from sowing until harvest, yet it always manages to take care of itself and of the weeds as well, and produces a perfect wilderness of feed, relished alike by horses, cows, hogs and chickens.

Indiana. J. F. M.

R. N.-Y.—We doubt whether it pays to sow Red clover with the Alfalfa. We would rather sow it alone. Next year's crop will undoubtedly be heavier. We endorse what is said about sorghum.

Spavins, Ringbones, Splints, Curbs, and All Forms of Lameness Yield to

Works thousands of cures annually. Endorsed by the best breeders and horsemen everywhere. Price, $1; six for $5. As a liniment for family use it has no equal. HUMOROUS

"You low and low the livelong day!"
Exclaimed the lamb. "Now, why?"
"Alas!" replied the homeless calf,
"I have no place to hie." —Puck.

KELLAR, the magician, is going to try farming. When he needs mo[illegible]nd he will probably turn a cow int[illegible].0-acre lot.—Chicago News.

"BLINKS is a confirmed o[illegible]chelor." "I bet if you'd shove a c[illegible]rfeit 50-cent piece on him he wo[illegible]arieк for a better half."—Baltimor[illegible]ish Comment.

"I WOULDN'T a-minded [illegible]alking over my hand," sobbed the [illegible] boy, who had been stung by the bumble-bee, "if it hadn't sat down so hard."—Baltimore World.

WILLIE came from the shed where Uncle Rufus was picking a chicken. "Aunt Sue!" he exclaimed, "what do you think? Uncle Rufus is in the shed husking a hen—honest true!"—Leslie's Weekly.

"YES," she sighed, "for many years I've suffered from dyspepsia." "And don't you take anything for it?" her friend asked. "You look healthy enough." "Oh," she replied, "it's my husband that has it."—Tit-Bits.

CITIZEN: "I'd give a clean thousand to find some way to exterminate these sparrows." Sporting Friend: "I'm your man. I've got just the thing." "Out with it." "Get the Legislature to pass a game law protecting them."—Life.

URBAN: "Why, old man, those chickens of yours are regular game cocks. What makes them such fighters?" "Suburban: "I'm sure I don't know, unless it comes from feeding them scraps."—Detroit Free Press.

EMPLOYER (meeting clerk at the ball game): "Why, Mr. Jones, when you asked leave of absence, you said you would like to attend your mother-in-law's funeral." Jones: "Yes, sir. So I would, immensely, but she won't die."—Baltimore World.

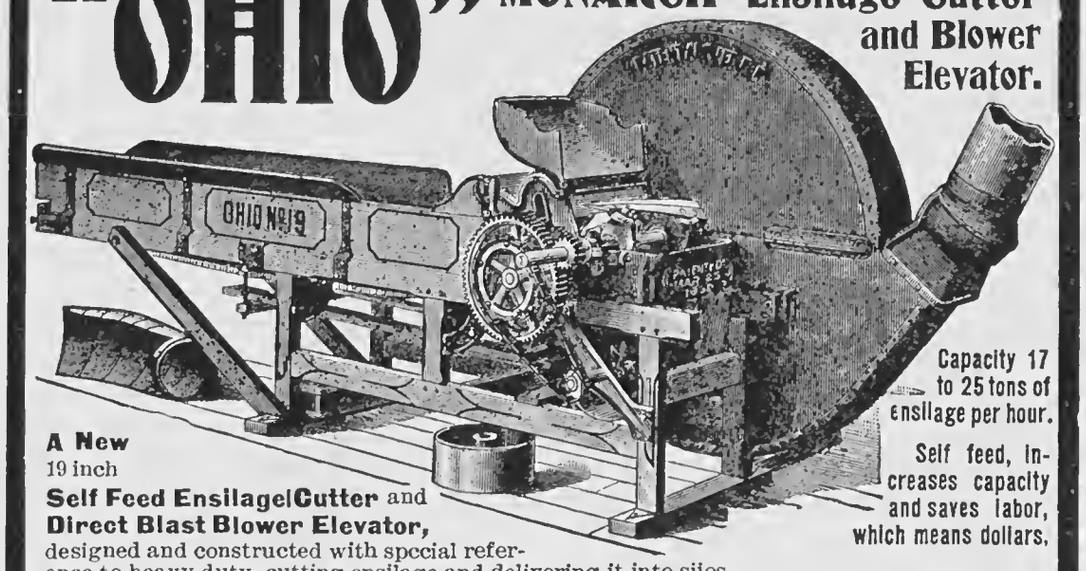
"YES," said the old inhabitant, "a mule kicked him 'crost a 10-acre field, an' when he landed a bull tossed him into a pine saplin', an' when he got thar a cyclone blowed the saplin' down, an' then he give up farmin' forever!"—Atlanta Constitution.

"WHY," inquired the New York girl, "do you Philadelphia people never eat snails?" "Oh!" answered the Philadelphia girl, with the air of one who had heard something like it before; "I presume it is because snails are so hard to catch."—Washington Star.

"So you rode the hair restorer agent out of town on a rail?" ventured the man on the coach. "Yes, stranger," drawled Amber Pete; "the cuss was a fraud. I poured three bottles of the stuff on my b'arskin breeches, an' it didn't make the hair grow at all."—Credit Lost.

MRS. NOOZY: "I think it's the most ridiculous thing to call that man in the bank a 'teller.'" Mrs. Chumm: "Why?" Mrs. Noozy: "Because they simply won't tell at all. I asked one to-day how much my husband had on deposit there, and he just laughed."—Philadelphia Press.

"OHIO" MONARCH Ensilage Cutter and Blower Elevator.



Capacity 17 to 25 tons of ensilage per hour.

Self feed, increases capacity and saves labor, which means dollars.

A New 19 inch Self Feed Ensilage Cutter and Direct Blast Blower Elevator, designed and constructed with special reference to heavy duty, cutting ensilage and delivering it into silos.

THE CUTTER is larger, stronger and has greater capacity than machines formerly made for this work. The knife shaft is heavier and the shaft bearings are longer and stronger. The knife cylinder is larger diameter, which better enables the cut ensilage to clear the cylinder.

BLOWER ELEVATOR. A large capacity, properly and substantially constructed steel fan case with agitator and conveyor at the inlet which make sure that the cut ensilage will get into it, and a swivel joint for the steel pipe at the outlet. The combined fly wheel and fan is mounted on the cylinder shaft and the Blower, while traveling at normal speed—600 revolutions—will elevate the ensilage into any ordinary silo as fast as it comes from the cutter and it is safe. Sizes No. 13, 16 and 18 Self Feed Cutters are also made with this kind of an elevator. Send at once for New Illustrated Catalogue. Manufactured by

LETTUCE AND CUCUMBERS UNDER GLASS.

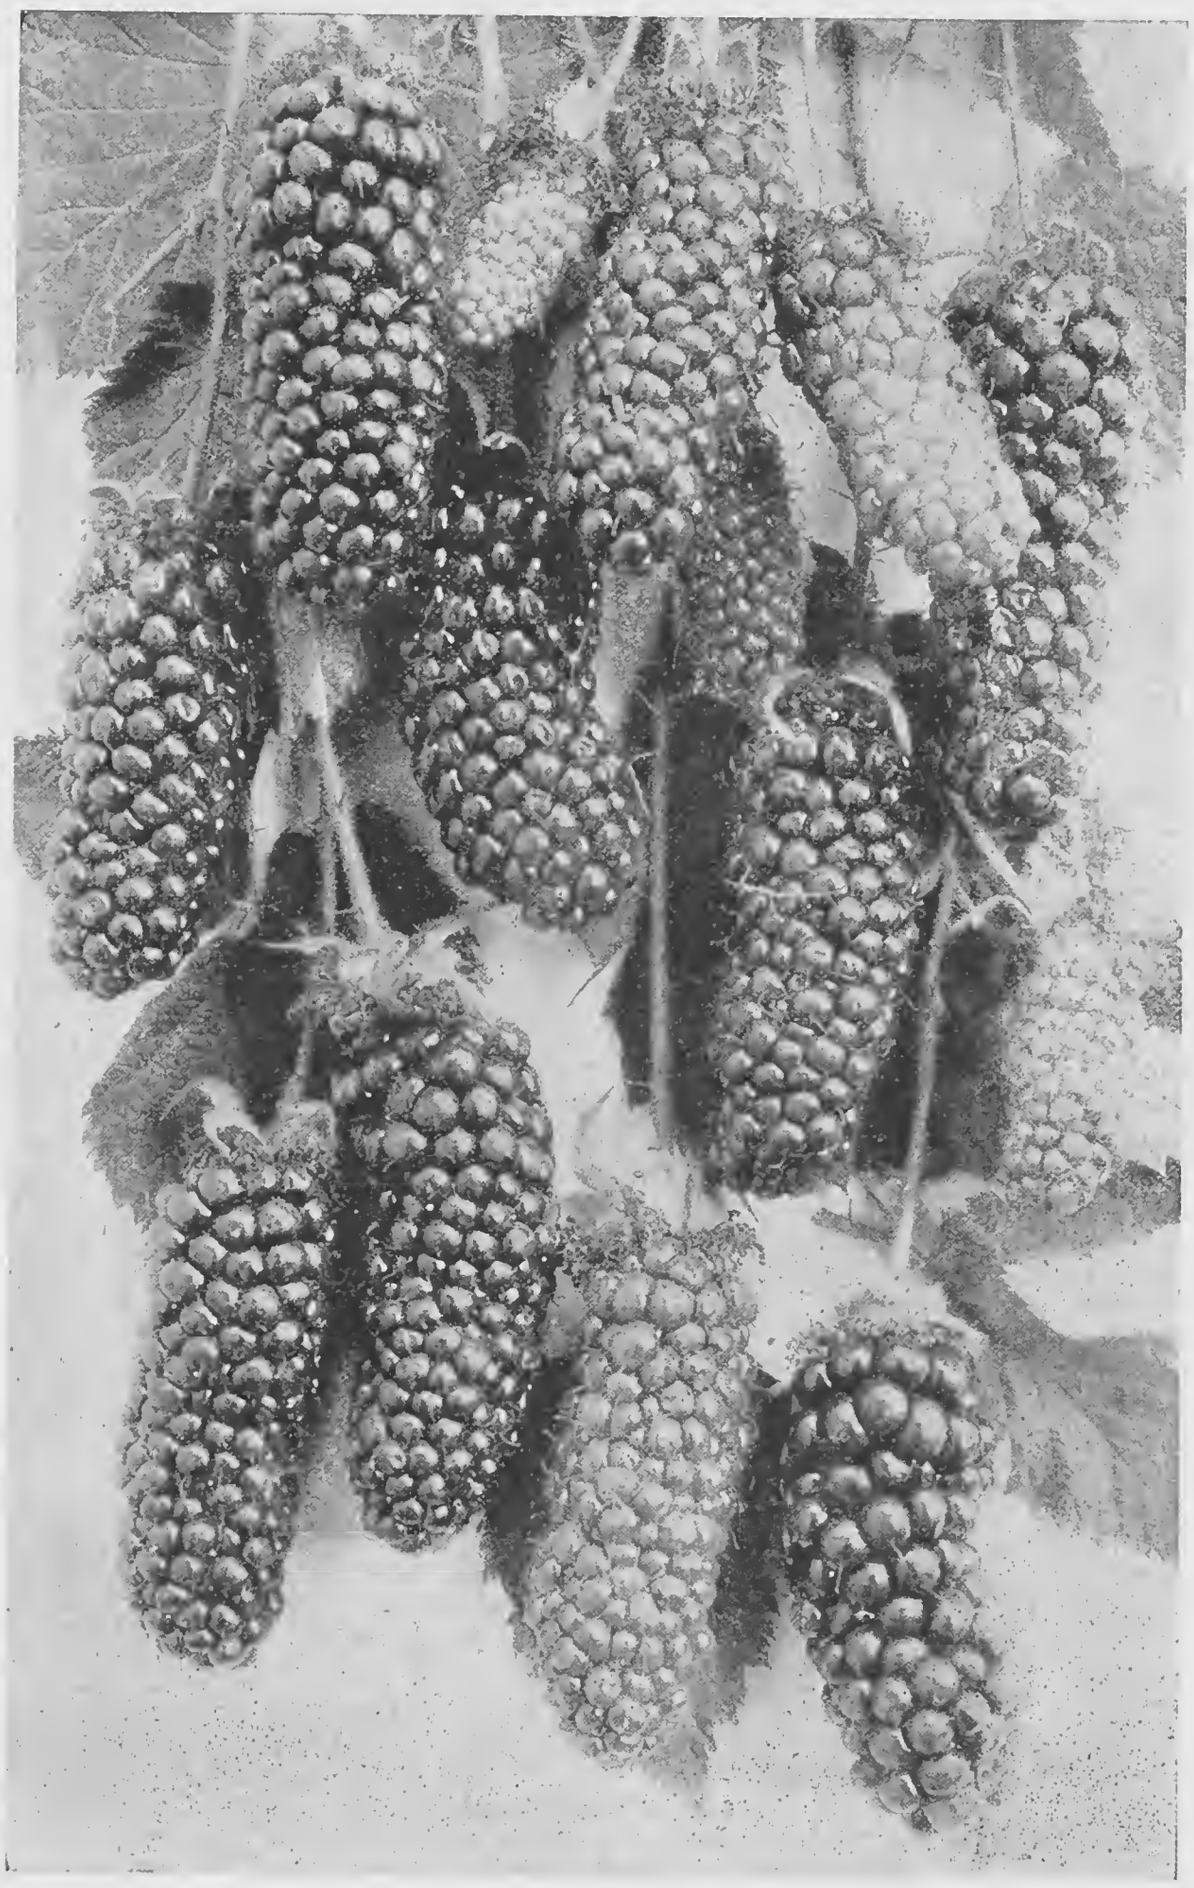
A BIG BUSINESS TO THE SQUARE FOOT.

How the Work Is Done.

Lettuce and cucumbers make a very attractive combination for the owner of forcing houses in these days of high-priced coal. There is a vast difference in fuel expenditure between the average of 45 degrees sufficient for the well-being of lettuce in Winter and the 60 to 75 degrees needed for most other glass-house products. By good management two and even three crops may be grown during the period of coal consumption, from November to April in the latitude of New York, and when well done Winter lettuce is conceded by practical growers to be the most profitable of all crops for the space occupied. For the best heads $1 a dozen was received during last Winter in the wholesale market, and the price for the season did not average much below 65 cents per dozen for those of good quality. When it is considered that greenhouse lettuce is planted eight to 10 inches apart, making it possible to get $1 for the product of about 10 square feet, and repeat the crop three times in a season, the possibilities appear vast. As in other horticultural operations, however, theoretical and actual results seldom tally. There is the usual gauntlet of destructive fungous diseases, depreciated markets and incidental defects to run, as well as the expense of a costly equipment. The warm-blooded cucumber comes in during the Summer months, when the solar heat is too much for lettuce. A great specialty is made of glass-grown lettuce and cucumbers in eastern New England, and the expert growers near Boston so monopolize the market that the outdoor southern product finds only a scant welcome. The output about New York is proportionately much less, and competition with southern growers is more keenly felt on account of cheaper transportation; nevertheless some of the finest lettuce and cucumbers known to the trade are produced in near-by establishments.

One of the most successful growers shipping to this great market is J. H. Becker, Morganville, N. J. He knows how to grow these acceptable esculents, and usually gets top prices for his products. Mr. Becker came seven years ago from Long Island, where he had grown market vegetables many years on land whose value per acre was expressed in four figures. He bought a run-down farm near the railroad, where transportation facilities are excellent, and built two forcing houses 40x315 feet each. His products proved so acceptable in the city markets that six more houses of the same width, but 350 feet in length, were soon added, making an extensive and complete plant. Meanwhile a most comfortable dwelling was erected, and the land brought into condition for satisfactory cropping. While fruits in abundance and garden vegetables are produced, lettuce and cucumbers in the big glass houses remain the special crop, and well fill the business year.

Lettuce planting begins about September 1, and an average of 25,000 plants are set in each of the longer houses. They are grown on the soil surface, no benches being used, the soil is carefully worked up, several tons of fine manure being used in each house.



THE MAMMOTH DEWBERRY. FIG. 265.

See Ruralisms, Page 598.

The after care, aside from frequent cultivation, consists of judicious watering and ventilation, as well as proper management of temperature. The object is to maintain a good growing moisture in the soil, but to keep the surface and the plants as dry as possible. The deadly "drop" and other fungi spread slowly on a dry surface, but with most malignant rapidity when sodden with moisture. The water is, of course, applied by overhead sprinkling, the effort being made to saturate the soil when the conditions of air and sunlight favor rapid surface drying. The necessary heat is maintained by hot water supplied by two batteries of three 3x12-foot tubular boilers, the coal consumption being probably the most serious item in the business. One house is planted each week until all are filled and the crops consequently mature in the same order. Cutting begins in the first-planted house about November 25. When cleared it is immediately replanted, getting, of course, another heavy application of fertilizer. This crop should be ready in January and the third in April. As the houses are not planted at the same time, only two crops are expected from the later ones. The varieties used are selected strains of the Boston Market type, generally named from the the seed grower, but Mr. Becker is now depending chiefly on seeds of his own saving. Glass-house lettuce must form a head if to be shipped, though the loose Grand Rapids type is all right for near-by consumption. The qualities sought are vigorous, rapid growth, resistance to disease, large, showy, stiff, dark green outer foliage, which may be crumpled or smooth, and a compact white head, as large and heavy as possible. This lettuce is packed for shipment in barrels of about 100 heads each, which are well lined with heavy paper in frosty weather. The quality of stiffness in the outer leaves thus determines to a great extent how full and attractive the barrel shall appear when opened at its destination. Lettuce is all right when intelligently grown with the proper equipment, as long as fungous troubles can be dodged. Mr. Becker has had little trouble so far, which he attributes as much to new soil and buildings as to his scrupulous care in management, but he looks for the day of reckoning when infection is so general that his soil must be sterilized, and is anxiously seeking information on the subject. Infection is so prevalent in the older New England houses that a practical steam sterilizer, to be moved over the beds before planting, has been evolved. It is said quickly to raise the soil temperature to 200 degrees to a foot in depth, and thus effectually cook all disease germs, and to be operated at a moderate expense. Sometimes soil is sterilized before filling beds.

As the April crop of lettuce is harvested the house is made ready for cucumbers, seeds of which are planted in March. They are set at intervals of four feet in rows the same distance apart. They are raised in plant boxes so arranged that the soil blocks may be cut apart without much disturbing the roots of individual plants. About 2,500 plants are needed for each house. A framework of cedar poles reaching to the glass roof, connected by transverse wires, is erected along each row of cucumbers to form a trellis, and the vines carefully tied on as they run. A hive of bees is placed in each house to pollinate the blooms. The first cu-

cumbers should be picked by the end of May, and the crop is practically continuous until lettuce is again planted in September, though the profits are small after July, when the local outdoor product reaches market. Only the best are then shipped, though all cucumbers must be cut to keep the vines producing. The effort is made, during the latter part of the season, to make the product of the houses pay running expenses, and is not always successful. A very liberal application of manure is worked in before the cucumbers are planted, as they are gross feeders, and if the market warrants top-dressings of fertilizer are given as growth proceeds. Water is given by a system of surface irrigation after the vines get on the trellis, and wetting of the foliage is avoided as much as possible to lessen risk of sunscald, to which cucumbers are liable under glass in hot weather. Lice and other insect pests are controlled by liberal applications of dampened tobacco stems to the soil, and the same remedy is used on the heating pipes for lettuce in Winter. Fumigation by burning tobacco is highly injurious to both cucumbers and lettuce, and the cautious grower has learned that his only salvation as regards aphids and other insect pests lies in preventing them from gaining a foothold.

The cucumbers are marketed in wooden half-barrel baskets, and are picked when six or seven inches long. The Arlington White Spine is the only type grown, and the effort is made to perfect a strain of the necessary vigor and productiveness, of thick symmetrical form, with few spines, retaining a rich dark green color under a faint bloom. A basket holds just about 100 cucumbers of the most perfect type, and early in the season $5 or even $7 does not seem too much for 100 such beauties. Mr. Becker has tried the best European forcing cucumbers, and while he can grow them perfectly, finds they will not sell. He thinks their flavor is much inferior to a properly-grown White Spine. W. V. F.

ADVICE TO "MOON FARMERS."

The following quotation is from a county paper of high repute, published in the western part of this State; it is a model county paper, ably conducted and edited. They have a column, "Farm Notes," made up of brief extracts from agricultural and other papers. This particular clipping surprises us. Does it state an actual fact, or is it an echo from the Middle Ages? "All things that grow out of the ground, such as peas, corn and the like, must be planted in the increase of the moon, from new to full; all things that mature in the ground, like potatoes, must be planted in the decrease or waste of the moon, from full to new." O. F. G.

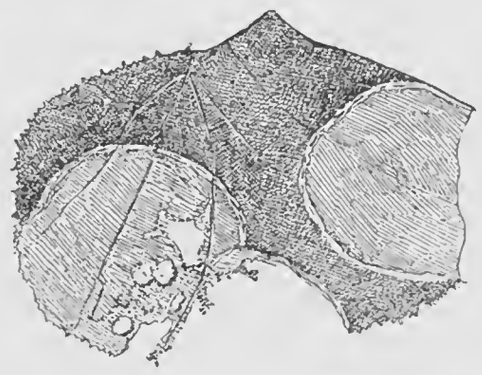
New York.

As the note reads it is utter nonsense. To say that crops *must* be planted "in the moon" is folly, for the best of crops are grown by farmers who never think of the moon at all. This echo goes back past the Middle Ages and will probably never die out. Many farmers are sincere in their belief that the moon influences vegetation. The scientific men are unable to prove that the "full" or the "waste" does not have a direct bearing upon the growth of plants. There is, probably, no experiment that would settle the matter, for half a dozen other things would make a difference with the crop, and no one could tell how much of this difference the moon was responsible for. It is safe to say that the best scientific men and farmers pay no attention to the moon in planting their crops. When the ground is ready they plant and let the moon run its regular course. Personally, we would just as soon imagine that it would make a difference in the digestion of supper if we ate it in the moonlight or in the shadow as to think that the moon could influence plant growth. We once pinned one of the moon farmers down to some definite reason for his belief. He said that bright moonlight deceived the plants. They thought it was still day, and kept at work, thus doing double duty! There was a time when such moon farmers would be called "ignorant." That word is not used as much as it was once, for as men gain in true wisdom, they realize how little they know. Any paper, however, that would use the word "must" in connection with the moon is too musty for live farmers!

CITY MEN ON FARMS.

Quite a number of farms in this vicinity have been bought and occupied during the past two years by city people, and most of their owners have been rare picking for the natives. The apparent trouble has been that these men knew absolutely nothing of the business, and what few ideas they had could be gained by reading one or two copies of a farm paper. There are a good many men like them, who seem to carry the opinion that farming requires no capital save the bare amount invested in the land and buildings, and no experience except what may be gained by reading a few farm papers for a month or two. Their ideas of the value of farm animals may be illustrated by one man who wanted to buy cows at $50 each. Whether they were worth $25 or $75 cut no figure; $50 was the price, and it is hardly needful to say that he got the $25 kind. They were told fairly good-sized stories by the real estate agent, and knew nothing of the soil and the crops suitable for it or for that region. One man told his neighbors he should be satisfied if he cleared $4,000 the first year on a small dairy farm. He hasn't the money yet, but quite a lot of experience. Some have depended on ignorant hired help, and have made a dismal failure.

I should not advise a city man to give up a sure thing in the city for an uncertainty in the country, unless he had sufficient capital to stand it a year or two without an income. The better way would seem to be, if possible, to make some arrangement with a good farmer and work for him a year, doing with his own hands all the different kinds of work possible, and keeping his eyes wide open. This may seem hard advice, but the experience will be gained much cheaper than going it yourself or depending on hired help. A man who knows nothing as to how work should be done, or when done, or how fast it can be



HOW THE LADYBIRD EATS. Fig. 266.

done, is a poor man to handle hired help. He ought, like the teacher, to be head and shoulders above the pupil in knowledge. Diversified farming, which is more suited to this locality, requires more experience and a longer head to make it successful than where one particular crop, such as onions, potatoes, cabbage or one or two kinds of fruit, are all that are raised in a section. Some of the city people who had good business heads, studied their branches thoroughly, starting them on a small scale, until they got their experience, and they have done fairly well; in fact, better than the old timers, as they had no ruts to get out of, or no false ideas, which sometimes are never eradicated from the country born and bred. Success to the city farmer, but go slow. Use your eyes, get your advice from successful farmers, and above all, don't brag; then you will have less to regret.

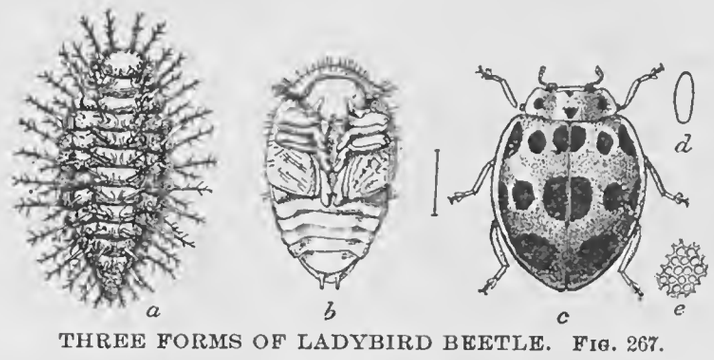
Connecticut. H. G. M.

SOME INJURIOUS LADYBIRD INSECTS.

I wish that Prof. Slingerland would describe the Epilachna borealis referred to in your reply to J. S. B. on page 532. Hitherto I have looked upon all the "lady-bugs" as my very best friends, and have, of course, treated them accordingly, and am desirous of being able to detect the "wolf in sheep's clothing" and treat him as he deserves. J. R.

Pennsylvania.

Of the more than 150 kinds of ladybird beetles in the United States, so far as we know of their habits, nearly all of them are beneficial to man in that they feed upon other insects that usually injuriously affect man's crops. But at least three of the ladybird beetles are vegetarians and have attained a place in the rogue's gallery of insect pests. The species which



THREE FORMS OF LADYBIRD BEETLE. Fig. 267.

is commonly injurious to vegetation in the East is known as the Boreal or Squash ladybird (Epilachna borealis). The four stages of its life—the egg, larva or grub, pupa, and adult or beetle—are shown much enlarged in Fig. 267; and in Fig. 266 is shown its characteristic manner of working on a leaf. In feeding it "stakes out a claim" in the form of a circle or semicircle, sometimes of great regularity, inclosing the portion of the leaf on which it is about to feed. The leaf is then eaten within this mark, and nowhere else. It is thought that this marking out of its feeding grounds is for the purpose of securing the wilting of the tissues of the leaf previous to its consumption. The Squash ladybird beetle is about a third of an inch in length (see hair line beside the beetle in Fig. 267), ochraceous in color and prominently marked with the rounded black spots as shown in the figure. Its eggs, deposited in clusters on the under surface of a leaf, are yellow, and the spiny grubs and the pupæ are also yellow. With these coloration details and the excellent illustrations, one should be able readily to determine this "wolf in sheep's clothing" among the ladybirds. In the West and Southwest beans are often seriously injured by another member of this same genus—Epilachna—of ladybirds, and it is said that the remaining third species of the genus in the United States is also a vegetarian. It is remarkable that all of the injurious members of the great family of Coccinellidæ or ladybird beetles so far as known, should belong to the single genus Epilachna. There seems to be but one brood of these injurious ladybirds in a season, and they readily succumb to the arsenical poisons. M. V. SLINGERLAND.

KEROSENE AND SAN JOSE SCALE.

There seems to be a feeling among some fruit growers that it is a disgrace to have it known that their grounds are infested with San José scale. This, it seems to me, is a very great mistake; still, it is a disgrace to have this minute thief on your place without making some practical attempt to dislodge him. I had heard lectures, seen pictures of him, had heard those scientific fellows tell how rapidly he would multiply, and how easy it was to get him and to get rid of him; but until last Spring never dreamed that I should be compelled to fight this scale in person. It had all appealed to me about as the reading of the accounts of the English-Boer war in South Africa; something a long way off. But about the first of last April it became a reality with a vengeance. In pruning my lower orchard of about 300 trees I discovered a peach tree badly infested. I at once sent for a team, pulled it out and burned it, and felt easy, thinking that that settled it with me, but not so. I very soon found the scale scattered here and there throughout the orchard. Then at once began running through my mind what I had heard and read—fumigation, kerosene, whale-oil soap, etc., but I did not know how to go to work. I finally decided to seek assistance, and at once wrote to Prof. Britton, of the Experiment Station. He said that all the above remedies were good, but he would hardly dare recommend any of them, for by that time the trees were in full leaf and fruit set, but finished his letter by saying that he would come and look the orchard over, which resulted in his sending down his spraying tools. June 19 the orchard was sprayed as follows: 225 trees with 15 per cent kerosene, 85 trees with 15 per cent crude oil, and a few trees with 20 and 30 per cent crude oil, also a few with common soap and water, one pound to two gallons.

The kerosene did no injury to leaf or fruit and killed about 90 per cent scale. The crude oil stripped off all foliage and fruit touched, and killed about 95 per cent of the scale. The soap and water had fully as bad results as the crude oil. The 20 and 30 per cent crude oil killed everything it touched, even the young twigs for several inches, and practically all the scale, but the trees have since leafed out, and at this time look vigorous. June 29 the first young scale were seen. I feel quite sure that if the spraying had been delayed until about July 1 a much larger per cent of the scale would have been reached and killed. While this one experiment does not establish the fact it looks as though 15 per cent kerosene was safe to use all over the peach tree. A. C. INNIS.

Connecticut.

WHAT TO DO WITH THE APPLES.

The apple crop of the United States and Canada is very much below the average. The result will be that the highest prices will rule, and a great many fruit growers and apple buyers will market almost everything that is grown, which will prove to be a very serious mistake While the crop is short, if this practice is carried out, there will certainly be a hard break in prices later on, as when the consumers find a large quantity of poor apples packed in with a few good ones, they will stop buying and turn their attention to other fruits. It will be particularly important this year to make strictly honest grades in packing. No. 1 apples should be strictly No. 1, entirely free from worm holes and other blemishes. A good No. 2 should be made, which will not be expected to be as fine as No. 1, though in this grade anything that is really bad should be excluded. All apples of medium size may be included in this grade if fair. It would be expected that they will not be entirely free from worm holes, although where badly affected, i. e., containing a worm hole in the side of the apple, rather than at the blossom end, such should be excluded even from the No. 2. If this practice is strictly adhered to the apple crop will bring a large amount of money to those who are fortunate to have this fruit, but if the poor are mixed in with the good, the reputation for this most desirable of all fruits will be seriously injured. Fruit growers cannot afford to jeopardize their future by taking advantage of the short crop to run in all the trash that grows in their orchards this year. People will pay good prices for good apples, but when the market is abundantly supplied, as it now is with many kinds of foreign fruits, they will not be imposed upon by poor apples put upon them at high prices. It is expected in the market that the heads of barrels will be faced up with the finest specimens, and while this may be permissible, they should follow right through every barrel, so faced, with good quality. The practice of facing with fine specimens, following with a half bushel of good apples and then filling in with culls is dishonest, and is nothing short of fraud. Honesty is always the best policy, and will be particularly so in packing apples this Fall. GEO. T. POWELL.

THE OLD FARMER AND THE NEW.

The R. N.-Y. Touches Both.

This issue is No. 2693 of THE R. N.-Y. We have subscribers now on our list who have taken the paper almost from the first issue. A picture of one of these old-time readers is shown at Fig. 268. William Wildey is still a hale and vigorous man. The writer met him last Winter at Medina shortly after he made the statement given below:

This is to certify that I, William Wildey, have been a resident of the counties of Orleans and Genesee, State of New York, for 60 years past. Forty-eight years ago I subscribed for the paper that was known as Moore's Rural New-Yorker at that time, since changing its name to THE RURAL NEW-YORKER. The length of time that I have taken the paper should be evidence of the fact of my approval of the same, as the knowledge that I have derived from reading it has been of great advantage to me. It has gradually grown better, keeping its editorials and readings up to date as to all points of interest to the agriculturist, and during the last two or three years, the paper has improved greatly in my estimation, and entirely to my satisfaction. My appreciation of it is such that it has become a part and parcel of our household.

Medina, N. Y. WILLIAM WILDEY.

Wherever we go among the people we find men who say: "Why, Father used to take Moore's Rural New-Yorker—I was brought up on it!" We find such men everywhere. Some of them have remained on the farm, and most of them, like Mr. Wildey, still take the paper. Others left the farm years ago, and have been successful in town or city. Some of these men continue to read THE R. N.-Y. While their life work has branched away from farming they still look back to the old home where Father and Mother lived, with grateful and happy memories, and THE R. N.-Y. helps keep up the connection. We fully realize what a strong hold the old paper had upon the heart and confidence of the old-time farmer. There is far more competition now, and there are hundreds of new things to attract attention—therefore, it gives us great satisfaction to feel that the modern R. N.-Y. is still going into the old homes, even though in many cases the old readers have passed away.

While referring to Mr. Wildey and his 48 years as a subscriber, it will not be out of place to mention our youngest subscriber. A picture of Master Clement G. Yates, of Connecticut, is shown at Fig. 269. He is now 11 years old, and has read THE R. N.-Y. thoroughly for the past three years. He is what we call a loyal subscriber, for he reads the advertisements and patronizes those who patronize THE R. N.-Y. He said one day: "I saw ——'s seeds for sale, but they're not advertised in THE R. N.-Y., so I wouldn't buy them." That is certainly what we call a loyal subscriber! This boy is specially interested in studying the diseases of horses and other domestic animals. It is good testimony in respect to the clearness of Dr. Kilborne's articles that Master Yates well understands what to do for the common diseases. When he hears of a sick animal in the neighborhood he gets out to help prescribe for it, and the first part of his prescription is the advice to subscribe for THE R. N.-Y. The cat shown in the picture was taken sick last year. Its owner wrote to THE R. N.-Y. about it, and was fully answered, so that the cat was quickly cured. No wonder both face the reader with confidence. This boy will probably make a farmer. He loves the country, though until three years ago he lived in the city. If he does choose agriculture as a profession he will make a good farmer, for he is building broad and deep in the science and practice of the business. It is a pleasure to think that THE R. N.-Y. can not only go down the shady side of life with the older men, but climb up the sunny slopes with those who have only a look ahead.

THE DESTRUCTIVE FRUIT ROT.

Fruit rot, soft rot, brown rot, known to the mycologist by the name of Monilia fructigena, causes every year more or less loss of early plums and peaches. This season, in central New York the damage has been severe. It is all the more apparent because of the comparatively small crop of fruit. When Alexander began to ripen, a couple of weeks ago, rot appeared and spread with aggravating rapidity. Sound peaches to-day were a mass of pulp to-morrow. Our men were certain that they rotted over night. Weather conditions were undoubtedly favorable. The days during the first half of August have been characterized by a high percentage of humidity, while the nights have been comparatively cool, yet not cool enough to arrest the progress of this destroying agent. At the present writing, plums, particularly Domestica varieties, are rotting badly. The natives, especially those of the Hortulana section, are more immune than the Europeans, while Japs occupy a somewhat intermediate position. Prunus Simoni, represented on the Cornell grounds by three trees very heavily laden, has been very slightly affected. Is not this a good point in favor of this plum, particularly from the plant breeder's standpoint?

A pointed question is, what shall we do? Bordeaux Mixture cannot be satisfactorily used on peaches and plums at this season of the year. It seems to me that remedies should fall under three heads—thinning, spraying, sanitation. While thinned fruit on our grounds was not by any means immune to rot, yet it was much less susceptible than fruit unthinned. Plums or peaches touching each other transmit the disease with great rapidity, while properly thinned fruit is safer to that degree. What shall we spray with? I am inclined to think that fruit growers have overlooked too much the advantages of the ammoniacal copper carbonate spray. This is not much more expensive than Bordeaux Mixture, is applied with a great deal more ease and comfort, does not stain the fruit, and is just about as effective as Bordeaux. We have got into the habit of using Bordeaux almost exclusively, and have paid too little attention to some of the other fungicides which have special features of usefulness. Can we help the situation by good sanitary practices? An affirmative answer seems reasonable. How many orchardists carry out the practice each Autumn of picking off and burying the mummified plums? How many cut off and burn the dead twig ends on their peach trees caused by this fungus? If spraying and sanitation were practiced a great deal of seed of this destructive disease would be destroyed. JOHN CRAIG.

Cornell University.

WILLIAM WILDEY. FIG 268.
An Old Reader of THE R. N.-Y.

R. N.-Y.—Readers will remember that the Bordeaux Mixture is composed of lime, sulphate of copper and water. The other spraying mixture mentioned by Prof. Craig is composed of carbonate of copper dissolved in ammonia and diluted with water.

BLIGHT AND WILT ON MELONS.

I wish to inquire regarding the article in a late R. N.-Y. about the muskmelon crop at Briarcliff Manor School. You say that the entire crop was destroyed by blight last year within a few days of ripening, but that the growers think they can pull them safely through this year. We would like to know how they are going to do it. Have they been attacked by wilt? If so, what preventive or cure has been used? L. J. B.

Central Ohio.

Last season our muskmelons were destroyed within 10 days of marketing because no attention could be given them in the way of spraying, the school not having started, nor was there any apparatus at that time. This year, by starting the plants in the greenhouse and transplanting to the field we hoped to secure the crop, due attention being given to spraying and other essentials. In this exceedingly trying season we have gathered some melons, not a full crop by any means, but still enough to give us great hopes for future crops. Vines when put out were a little larger than they should have been, owing to unfavorable weather for setting, and after being transplanted they were severely checked by cold weather. Rain has fallen in torrents upon them through the whole Summer, and the Bordeaux Mixture with which they have been sprayed has often been washed completely off within a few hours of its application. Under such conditions the surprise is that we gathered any fruits at all. Those that we picked were of far better quality than melons purchased in the New York market at the same time, and we have great hopes for the success of future crops. The blight can be controlled by Bordeaux Mixture, the 75-gallon formula, if the plants are sprayed every week from the time they show their first leaves until they are robbed of their fruit. It is essential to apply the Mixture to the undersides of the leaves from the very start. A bent-necked Vermorel nozzle is the best we have, since it makes a very good mist-like spray. Enough of the fungicide will fall upon the upper surface without any effort to place it there. This disease makes its appearance usually in August.

Vine wilt is more serious. We have no remedy. Our plan for next year with respect to it is to plant upon land that has not grown any cucumbers, melons, squashes, etc., for years, and to prevent the attacks of Squash bugs and other insects, since they carry infection. This is not easy. Bugs must be caught by hand, and the striped beetle repelled by tobacco dust. We shall also cover the vines with netting to keep bugs off. Our other vines have suffered from wilt; late squashes will not be more than half a crop, even though thousands of bugs were picked off them, and no eggs were permitted to hatch until the vines commenced to run and the picking became too extensive. This was a grand year for Squash bugs, and the "radish cure," if I may call it such, referred to in THE R. N.-Y. several weeks ago, was utterly useless, though the radishes, which were planted in the hills by students, were thick enough for lawn purposes. In fact, the bugs seemed to enjoy the shade of the radishes while they lay out at full length to sip the luscious squash juice. Our Summer squash is but little affected, either by bugs or diseases, and considering the bad weather has done nobly. M. G. K.

A TRAP FOR THE HESSIAN FLY.

About a year ago Prof. Roberts visited the writer of the following letter, and advised him to sow a decoy strip of wheat around his field, which he did. The results, as set forth in the letter to Prof. Roberts, are so satisfactory that it is deemed wise to lay the matter before the farmers without delay.

PROF. I. P. ROBERTS: August 19, 1901.

Dear Sir—I have just read with a great deal of interest your latest bulletin, No. 194, on the Hessian fly, and it reminded me of my promise to inform you of my success with the "trap or decoy" strip that you recommended me to sow last Fall. I sowed two widths of the drill around a 20-acre field August 25 last year, then sowed the remainder of the field September 27-28, and just before the last sowing came through the ground, plowed the "decoy strip" under just as you advised, and resowed it. When I plowed that strip under I found that practically every leaf and stalk of wheat was completely covered with the eggs of the fly, so that the strip looked brown, and myriads of the fly swarmed up in front and under the horses as they walked over it.

Now for the result of my extra labor, amounting to one-half day's work for man and team and two bushels of wheat used on the "trap strip." I have just thrashed as fine a sample of No. 6 wheat as you could wish to see averaging 21½ bushels per acre, this average including seven acres on a nearby field that was sowed after beans, where I could not use the trap strip. From the amount of straw harvested on the 20-acre field, in comparison with that grown on the bean ground, and the difference in the condition of the two fields at the time of harvesting, I am confident that the 20-acre plot gave me 25 bushels per acre of first-class wheat. You will perhaps remember that we called upon some of my neighbors, when you were here, and you advised them to sow the "trap strip," and I went to them afterwards and begged them to coöperate with me in this fight against this terrible pest; but I could not get one of them to do so, with the result that they are thrashing out from two to eight bushels per acre of poor chicken feed. Most of my neighbors are now preparing the trap strips, and we are going to sow them this week, and I am besieged with questions from those at a distance who have heard of my success along this line. I would rather risk the "trap strip" and thorough preparation of the soil and a good fertilizer and late sowing with No. 6 than to attempt to raise Dawson or any other so-called fly-proof wheat of an inferior milling quality.

I have a scheme to catch the fly that we found lodging in the "trap strip" when we plowed it under, i. e., to plow this strip under in the night or very early morning, while they are stiff with the chill of the late September nights, and I believe that we can rid ourselves of millions more of them. S. W. WADHAMS.

It is urged that farmers sow decoy strips of wheat around their fields. The season seems to be favorable for an early development of the fly and these decoy strips together with late sowing of the main crop on well fitted ground will probably go a long way towards circumventing the pest. J. L. STONE.

College of Agriculture, Ithaca, N. Y.

Farmers' Club.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Wages for Grape Packers.

Reader.—What wages or prices are paid for packing grapes?

I never pack grapes in baskets, and do not know what is paid by those who do. The gathering of my grapes is done by my regular help, as required, and no account of cost kept apart from other work. This wet, sultry weather is causing some rot in grapes, more, I think, than usual with me, though not serious.

New York. WALTER F. TABER.

I have never had grapes picked by the basket, for the reason that I keep so many employed in the nursery that when we pick grapes we have our men pick them. However, I do not grow many grapes anyway, and there are not many grown here. I pay my men from $1.25 to $1.50 per day; a few skilled men I pay more. SILAS WILSON.

Iowa.

The average price for packing grapes in this section is seven cents per hour. The work is done by women, and costs, when the grapes are in fair condition, about one cent per five-pound basket. For regular work men get $300 per year, or $30 per month; $1.25 per day and board themselves. For picking currants and cherries we pay one cent per quart; strawberries 1½ cent per quart.

Trumansburg, N. Y. D. R. P.

In this grape section packers are almost invariably paid by the day and not by the basket. The average price per day is 50 cents and board, or 75 cents without board. What that would be per basket depends somewhat on the worker's skill and experience, but more on the condition of the fruit. In this vicinity all grapes are picked at least 24 hours before packing, so that the stems can wilt slightly. The clusters can be packed more closely in the basket without breaking the stems or cracking the berries; then all imperfect, decayed and cracked berries are trimmed out. A good packer will pack from 300 to 500 baskets per day, and keep several girls busy trimming. No grapes are ever packed direct from the vine into the basket, in this Keuka Lake grape region, as they do in Chautauqua County. The wages of other help in vineyard and on fruit farm vary from $1 to $1.50 per day for men according to their ability.

Penn Yan, N. Y. E. C. G.

Hessian Flies and Ragweed.

L. F. A., Walworth, N. Y.—I send you a box containing stems of ragweed cut from wheat fields. Are insects in the stem the Hessian fly maggot? I have examined several fields where the fly ruined the wheat crop, and find nearly all of the ragweed in this condition. I have examined ragweed in corn and other places, and do not find any of the insects. If this is the fly why not mow the weed and burn it? A small acreage of wheat will be sown here on account of the ravages of the fly.

ANS.—No, the stems of ragweed were not infested by the Hessian fly. The stems had been tunneled by a small caterpillar, but nearly every caterpillar in the stems sent had been killed by a little ichneumon parasite. I found many of the little brown cocoons of this parasite in the stems, and one or two pupæ of the caterpillar which bored the stems. I think that farmers will make a mistake in giving up sowing their usual acreage of wheat this Fall. For, even though the fly should be as numerous as it was last Spring, the weather conditions thus far this Summer are such as to indicate that the flies will emerge at their normal time, or early in September, and thus late-sown wheat will be much more likely to escape the fly than it did during such an abnormal season as last year, when the flies continued to emerge much later. I would advise farmers thoroughly to prepare their soil, and sow a decoy strip of wheat around the field at once. Then wait until about September 20 to 25, and plow under the decoy strip, and then sow the whole field. I believe that by this maneuver a farmer will win nine times out of 10 against the Hessian fly. One must not expect to grow any crop without risking something. M. V. SLINGERLAND.

Value of Pearl Millet.

D. L. P., Dover, N. H.—What is the true name of "Pencillaria?" A neighbor planted quite a lot this Summer and it much resembles corn growing in tufts or stools. Is it of agricultural value and adapted to silage?

ANS.—One of the older botanical names or synonyms of Pearl millet, Pennisetum typhoideum, is Penicillaria spicata. Pearl millet is a very strong-growing species from northern Africa. Planted in rows three or four feet apart on rich ground it will give an astonishing amount of palatable forage, which is relished by cattle and horses. In good seasons it may be cut three or four times, and two or three crops may always be expected. It does not amount to much on poor land or under careless cultivation. It is little grown in this country except for experiments, but could be made useful where soiling crops are wanted.

Pruning a Cherry Tree.

J. R. F., Norwich, N. Y.—One of my Black Tartarian cherries is strong and vigorous, but though standing in the open, persists in making an almost perpendicular growth—like a poplar. Will it harm the tree to head it in severely next Winter when dormant? The authorities I have consulted say a cherry should be pruned sparingly.

ANS.—Sweet cherry trees as a rule need little pruning, but in case of too upright growth the top may be headed back, taking care to cut to an outside bud as far as possible, so that the new growth will be likely to spread.

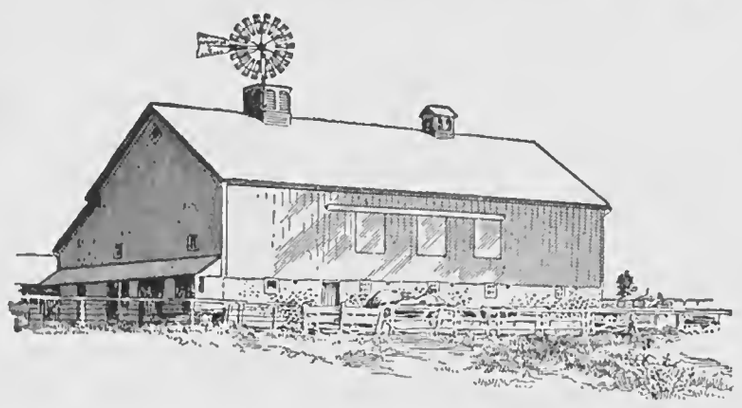
A Parasite on Raspberries.

P. M. H., Littleton, Mass.—I send a piece of Cuthbert raspberry vine with a vine which encircles it. It was first seen perhaps a month ago, and I paid but little attention to it. I dug around the vines, supposing it came from the ground, but find it grows from the cane, adheres firmly and spreads badly. I have cut away 20 or 30 stocks, and fear it will still spread. A neighbor who has quite a large field of raspberries says he never saw anything like it. What is the parasite and how is it destroyed?

ANS.—The plant is Cuscuta Gronovii, and for lack of a well recognized common name it is usually called in the books Gronovius dodder, from Dr. Gronovius, who first collected it in Virginia and sent a specimen to Europe for identification in the early Colonial days. There are more than 100 species of dodder recognized, many of them native in this country. This one is abundant in many localities throughout the eastern part of the United States. It generally grows on coarse herbs and bushes in low land. I have but one record of it heretofore as growing on raspberry bushes. That was at Andover, Mass., and an account of it occurred in a recent number of THE R. N.-Y. Gronovius dodder, like all other species of dodder, is an annual, and is propagated by seeds which germinate in the soil, sending up tender shoots. These swing about in the air until they touch some green plant upon which they can grow. If a suitable host is found the vines twine around the plant, sending suckers or small rootlets into the tissues of the host, through which the parasite obtains nourishment. The connection with the ground then dies. The young dodder soon dies off if it finds no suitable host plant. This species grows most rapidly in the shade, or where the vegetation is rather dense. The best remedy for its destruction is therefore to keep the raspberry canes thinned out, and to cultivate the soil so as to destroy the young seedling dodders. The infested stalks should be cut and burned, to prevent the seed production, and the place where the dodder has been introduced should be closely watched next season, so as to destroy the young dodder plants as soon as they appear.

LYSTER H. DEWEY.
U. S. Department of Agriculture.

LET THE WIND WORK FOR YOU



Don't do work that the wind can do for you. A windmill isn't for pumping alone; that is but a tenth of its possible service. Let us send you our 40-page book showing the dozens of things that a power Aermotor can do. The hardest part of your work can be saved by it.

Wind power costs nothing. It is almost always available, if you have the right windmill. The first cost is small; the running expense almost nothing. Its efficiency is marvelous.

Take feed-grinding for instance. We make a simple and inexpensive grinder which, in connection with the 12-foot Aermotor will, in a fair wind, grind from 12 to 15 bushels of feed per hour. A 16-foot Aermotor will operate two or three of these grinders with a capacity of 25 to 40 bushels per hour.

Besides doing his own work, many a farmer has paid for his power Aermotor the first season by doing custom grinding for the neighbors. Many are clothing themselves and their boys every year with what it earns.

Then there is feed to cut, corn to shell, and wood to saw. The grindstone must be turned; the churn must be operated; the machinery in your tool room needs to be driven.

No need of doing these things by hand.

If you hire this work done, it may cost you as much every season as an Aermotor would cost.

If you or your boys do it you are wasting as much. And it is that kind of drudgery that drives boys away from the farm.

These very boys like mechanics. The operation of a power mill is fun for them. And they will find a score of ways to make it help in the farm work.

Let them do it. They will save all the dollars that you pay the miller and blacksmith. They will make more dollars by doing the same work for others.

You are using farm machinery that serves you but a few weeks in the year, and it pays. No modern farmer would think of doing without it.

A power Aermotor that costs less works 365 days in the year. Almost no attention is needed; the power is free.

You who get along without an Aermotor don't know what you miss. If you used one a season you would not go without it for many times what it cost. You would do without your mower first.

LET US SEND YOU OUR BOOK

If you would like to know more about the power Aermotor, write for our book. Remember that the Aermotor is the result of 5,000 experiments to learn how to get the utmost power from the wind. This book was written by the man who is highest authority on wind power.

It tells how he gets that power in the Aermotor; how he utilizes it without waste by friction; how he has made a power Aermotor, covered with 55 patents, that does as much work with a 12-foot wheel as the old kinds will do with a 16-foot wheel.

He tells how he cut the cost of wind power to one-sixth what it was when he started.

It also contains some very interesting extracts from very careful, scientific experiments made at the Universities of Kansas and Wisconsin. These facts are a matter of public record, but can be more conveniently read from this book, which we furnish upon request.

These reports show how wonderfully the Aermotor surpasses all other windmills in efficiency. They also give the results of a large number of experiments showing just what can be accomplished with different kinds of grain in winds of various velocities.

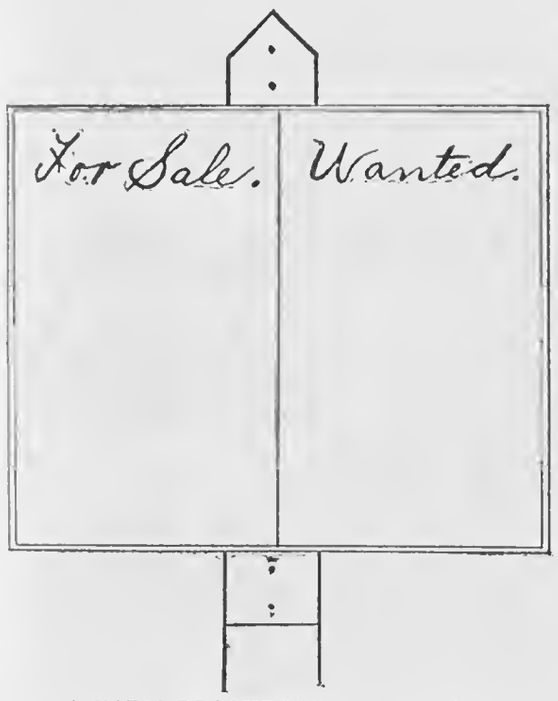
You can't afford to buy any power mill save the Aermotor. You would pay more and get far less if you bought any other. This book tells you why. More than half the world's buyers choose Aermotors now, both for pumping and power; and the other half would, too, if they knew them.

The book is free for the asking. Write today; we will send you the book and tell you the nearest dealer who has Aermotors on show.

AERMOTOR CO., 1206 ROCKWELL ST., CHICAGO

EVERYBODY'S GARDEN.

ADVERTISING ON THE FARM.—In nearly every locality, much may be accomplished by advertising whatever we have for sale. Proof of this will be found in your own desire to see what others advertise for sale. Personally, I am ready to admit that the advertising columns of any paper always have a strong fascination for me, and if I see what others offer for sale, others will see what I may have. The local newspapers judiciously used will nearly always bring ample returns. Neat circulars stating what you have for sale and how it may be obtained, mailed to your customers or to prospective ones, will usually meet a response. A very convenient way, and also one which has brought us very satisfactory results, is the simple device of a bulletin board. Referring to the illustration, Fig. 270, we have "For Sale" and "Wanted" columns, which words may be lettered permanently with white paint, or printed with chalk as occasion may require. A very cheaply constructed board (any desired size), may be made as follows: Use only the best quality of soft-wood lumber, free from pitch and knots. The boards should be evenly cut the desired length (a convenient size is 2½x3 feet), and fastened tightly and firmly together with cleats and screws. The screws should be driven from the back of the board, and



A FARM BLACKBOARD. FIG. 270.

should be ¼-inch shorter than the combined thickness of the cleat and board, so that they shall not reach through to, and interfere with the surface of the board. The outside cleats should be put on flush, or nearly so, with the ends of the boards; and the center cleat should be cut long enough to extend two or three inches above and below the board. A post should be firmly set in the ground to which the board may be fastened by driving screws through the projecting ends of the center cleat into the post any desired height from the ground. This leaves the entire surface of the board free from screws or nails, and it may be put up or taken down at will.

To prepare the blackboard for use, take the best grain alcohol and shellac in the proportion of two parts of the former to one part of the latter; one pint of alcohol to one-half pint of shellac would doubtless be sufficient. To this mixture add sufficient of the best black drop (powder), to give the desired color, which should be a dead black, and one tablespoonful of finely powdered pumice stone. This latter is added to give the mixture sufficient grit to take the chalk freely when thoroughly hardened. Apply with an ordinary paint brush, three or four coats, allowing each application to dry thoroughly before the next is made. This formula has been sold at high prices, but was furnished me by an experienced decorator, and pronounced the best blackboard dressing in the market. Try it on your school blackboards, and save exorbitant charges by one hired to do the work.

Lacking this more expensive device, equally good results may be obtained by using the ordinary tarred building paper tacked on to any smooth surface. It is best held in place by tacking a lath or light strip of board over each edge. Use ordinary school crayons; the writing is easily erased with a wet cloth when any changes of products wanted or for sale are required. Of course, it goes without saying that the board should be erected in as conspicuous a place as possible, and buying, selling and exchanging can be very advantageously advertised, often with surprising results. J. E. MORSE.

Michigan.

"DIDN'T KNOW IT WAS LOADED."

Radish Seeds in Squash Hills.

I am the man who did it, but really I did not know it was loaded, and might kill 350 hills of squashes as A. M. J. says it did. His letter of complaint was conspicuously posted well up on the editorial page, an honor few of us may hope to attain. If this can go in at all, chuck it in any odd corner, or in the humorous column, which by the way, my wife always reads the first thing, too often finding the mailing tag stuck over the best joke. There is a seriocomic aspect to the whole affair, though it was evidently no joking matter to A. M. J. He seems a bit riled about it somehow. This is no choke, as the Teuton said when they were stringing him up.

The writer saw the suggestion to plant radish or turnip seed in squash hills as a discouragement to bugs in a publication sent out by one of the oldest and most eminently conservative seed firms in the United States. The name, if mentioned, would be immediately recognized wherever the English language is used. For obvious reasons it won't do to insert it here, but if the matter is of enough importance to warrant such procedure I am willing to disclose it to a select committee of 13, duly sworn to secrecy, in order that said seed house shall not receive gratuitously the advertising that will result. THE R. N.-Y. is a far-reacher. Drop in a pebble; it will at least make a ripple. It may hit nothing or nobody hard, but then again it may hit dynamite and kick up quite a muss. Let us look for this. A sermon might be preached on the malign effects of imperfectly interpreted suggestion, with some remarks on the danger of going off half cocked. The text might be "Let your communications be yea, yea, and nay, nay."

The editor stated my case fairly. I *did* just want to know. I did not tell any one to do this dreadful evil thing. I only asked had others tried this method. I tried it again this year, and failed utterly, and tried also dusting with lime or plaster scented with carbolic acid. No good; everything was "teetotally" eaten up. Of course I may have felt a little jealous because the unfortunate victim got in on the editorial page, but I did not become obstreperous when I received a good whack for rushing into print with new and untried things. I took it as a sort of sop to the other fellow, for whom we all feel so sorry, and I was disposed to accept the rebuke as meekly as if I had deserved it, until the other day, when I met an aged grandmother who had been brought up on Long Island in a section where the intensest high-grade successful farming had prevailed for nearly a century. I asked her about the practice in question, and the dear old lady laughed heartily. "New! Untried!" she cried. "Why, I have known it all my life. We always planted radish seed in squash and cucumber hills." This got my dander up a little, and provoked me into offering this explanation and defense. I shall venture to keep on asking questions now and then, not too often, nor too many, for I am aware that there are others who want to know about things, but I will try to be careful; I have learned that questions may be dangerous.

For years I have noticed in an admirable little paper noted for its terseness and brevity, the injunction not to let cedar trees grow near apples. I wanted to know why, but would not ask, and finally after years of careful watching, learned the reason. Since then along my line fence I have cut down several fine cedars, because I thought they would injure my neighbor's orchard. I have been told that no Black walnuts should be allowed to grow near pear trees, and have wondered whether butternuts had any pernicious influence upon fruit of any kind. There are some other things I hope to know when the experts get done fighting over them, and are able to tell me what is what. Right here and now there is another question I am going to ask, no matter whether it is loaded or not. I was informed recently that hollyhocks are injurious to roses. There is a big one in the same bed with Ruby Queen and other roses. Must I yank it up? Tell me, oh tell me, Dr. van Fleet, must the hollyhock be fired root and branch out of the rose garden, and can this weighty question be safely fired into print and into the wide constituency of THE R. N.-Y. readers, without threatening the extermination of the stately and beautiful hollyhock?

J. YATES PEEK.

Let the hollyhock alone. It won't hurt the roses if they don't crowd it too much. Fire any questions you like.

W. V. F.

An Ice House With a Cellar.

A. B. W., Newlin, Pa.—I expect to build an ice house, and I would like to build it on the following plan, if you think it would be a good one. Size of house 10x10 feet. I wish to dig out the same as for a cellar, build the wall 18 inches thick, and about six feet high; put an iron beam in the center each end to rest on wall, then cover over with flagstone, the flagging to rest each end on the wall, and also on the iron beam in the center; then fill out all cracks with good cement mortar to make it airtight. The house built on the wall and put about 12 inches of sawdust on top of flagstone, then fill with ice the same as other ice houses. The cellar part below the flagging I want to keep my milk and cream in. Have any readers of THE R. N.-Y. tried anything similar to the above plan? Will ice keep well in such an ice house?

R. N.-Y.—Have any of our readers tried this? If so, we shall be pleased to have them report.

CRIMSON CLOVER SEED—New crop; home grown. Now ready.
R. S. JOHNSTON, Box 100, Stockley, Del.

CLOVER SEED—Choice, clean Crimson or Scarlet of my own raising, $4 per bu.; sacks free. J. C. ELLIS, Millsboro, Del.

Seed Wheat—Dawson's GoldenChaff, Democrat, McKinley, Bald, Jones No. 1. and White Chaff. 25 tested kinds.
"SMITH'S" Wheat Farm, Manchester, N. Y.

Dawson's Golden Chaff

Greatest yields of the year. Our yield 36 bushels per acre, thrasher's measure. White, plump, clean, pure. Also Gold Coin. $1 per bushel; bags, 15c. O. C. SHEPARD CO., Medina, O.

LIME FERTILIZER.
Special preparation giving splendid satisfaction. Correspondence solicited. THE SNOW FLAKE LIME CO., Bowling Green, Ohio.

FOR SALE—Seed Wheat—Red Harvest King. Not fly-proof, but one of the best fly-resisting heavy yielding varieties, $1 per bushel; bags free.
GEO. M. TALLCOT, Skaneateles, N. Y.

CRENSHAW BROS.,
Wholesale and Retail **Field and Garden Seeds**
Correspondence solicited, with view of either buying or selling. We grow Velvet Beans, Giant Beggar Weed, Florida Favorite and New Triumph Watermelon Seeds. 1222-1224 Franklin St., Tampa, Fla.

DAWSON'S GOLDEN CHAFF WHEAT is a variety which originated in Canada. After being tested by the Ontario Agricultural College, also the Michigan Agricultural Experiment Station, it has never shown any trace of the Hessian fly, while adjoining fields were ruined. It is very hardy, a big yielder, heads compact, squarely built and well filled, red chaff and light amber grain. Will yield from 30 to 40 bushels under ordinary circumstances. Price, $1.25 per bushel. We also have the Mammoth White Winter Rye, very hardy, and a big yielder. $1 per bu. Black Winter Rye, 75c. per bu. Ask for prices on Timothy and Clover Seeds.
HARVEY SEED CO., Buffalo, N. Y.

TREES AND PLANTS—Free from Scale. New and Choice Varieties. Blackberries, Strawberries, Raspberries.
Our FREE CATALOGUE will save you money. MYER & SON, Bridgeville, Del.

TREES $8 PER 100—APPLE, PEAR and PLUM, 3 to 5 feet high. HEALTHY and TRUE TO NAME. Best varieties.
We sell all kinds of trees and plants at lowest **Wholesale** prices. **Don't** buy until you get our Catalogue, which is free, or send list of wants for **special** price. Address RELIANCE NURSERY, Box 10, Geneva, N. Y.

THE STORRS & HARRISON CO., PAINSVILLE, OHIO.
Leading American Nurserymens offer one of the Most Complete Assortments of
FRUIT AND ORNAMENTAL TREES, SHRUBS, ROSES, BULBS, ETC.
48 Years. 44 Greenhouses. 1000 Acres. Correspondence Solicited. Catalog Free.

ROGERS NURSERIES
are on the hills overlooking the Genesee Valley. Our trees are hardy, healthy, vigorous and well-rooted. You can depend on ROGERS TREES for future results. Bred from selected bearing trees; you know what they will bear when you plant them. Write for copy of the "TREE BREEDER;" you will find it worth while. Address simply ROGERS ON THE HILL, Dansville, N. Y.

Why Not Add to the Certainty of Growing a Good Crop of Winter Wheat by Sowing Our "Turkish Red"

THAT always produces a good crop wherever Winter wheat can be grown? It is iron-clad and the hardiest wheat in existence; has proven of strongest vitality, given the biggest yield and best wheat in the world at every Experimental Station where tried. It has a record of 55 bushels at Iowa Experiment Station, and an average yield of 45 bushels for the past 10 years. Hundreds of farmers grew from 10 to 20 bushels more per acre this year from our seed than from best common sorts. Price, $1 per bushel, bags free, f. o. b. here. Write for **Free Catalogue** and descriptive circulars. New crop choice home-grown Timothy seed, $2.50 per bushel, sacks free. Address, mentioning The Rural New-Yorker,
J. R. RATEKIN & SON, SHENANDOAH, IOWA.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

SOME BERRY OBSERVATIONS.—The following comments on Ruralisms' berry notes have been received among many others:

In Ruralisms, page 550, I noticed what appears to me as an error in describing the Mayes and Lucretia dewberries. I think the description as given of one variety applies to the other in each case; that correction made I think the difference between the two varieties well stated, but with me there is another important difference, and that is that the Mayes is hardier under exactly same conditions. Also, the crop of Mayes is off in half the number of pickings, which fact, together with its being earlier, gives it the preference with me over any other cane fruit.
Burlington Co., N. J. E. S. HOLMES.

The late discriminating and appreciative articles on the Mayberry and the Iceberg blackberry have been read with interest. I am glad that the Mayberry has found a welcome in some localities, and was somewhat disappointed that it did not prove more generally useful. I have varieties much more than twice as large as the Mayberry, which I first sent out, firmer, and with a really delicious flavor, which cannot be found in the original Mayberry. The white blackberry, Iceberg, was stolen from me while in the hands of some eastern propagators, and 100,000 plants were offered for sale before I knew it was to be introduced. You are correct in the statement that the flavor of Iceberg is somewhat astringent, but I have a variety now, second generation from Iceberg which is fully equal in quality to any blackberry in existence, and by most people claimed to be better than even our favorite, Lawton. It is also much firmer than Iceberg, a better bearer, and the berries are more nearly white. The Iceberg came from the old Crystal White, pollinated with the Lawton. *Every* seedling from this cross was black in the first generation, and every seedling in the second generation (several hundred plants), was black, and most resembled the Lawton, which is very prepotent, except two white ones, Iceberg and another that proved worthless. The new one spoken of above will certainly have a place as a market berry, but cannot be introduced before three or four years, as the stock is limited.
Santa Rosa, Cal. LUTHER BURBANK.

The Lucretia and Mayes dewberries on the Rural Grounds are grown under labels as received. It is evident that Friend Holmes's varieties are reversely labeled from ours, and the question is, which is correct? He prefers the Mayes, which would be our Lucretia, and after reviewing the season's experience we like Mayes (his Lucretia) rather the better, as it produced more perfect berries. We want more light on dewberry varieties.

The remarkable picture on first page, Fig. 265, is a natural-sized photographic reproduction of the Mammoth blackberry or rather dewberry noted on page 550, as grown in California. Our plants set last year only produced berries half as big, but we have no doubt of the literal correctness of this picture, kindly furnished by the disseminator, James Waters, Watsonville, Cal. Mr. Waters writes that berries even larger were gathered this season. We found the Mammoth hardy as regards last Winter's cold, productive and of very agreeable quality, and we expect larger berries as the plants gain strength. The reputed parents of Mammoth are not large fruited species, and the production of such immense berries by the offspring is to the plant breeder a singular and unexpected result.

A BLUE DAISY.—The very extensive family of Compositæ or daisy-like flowers runs chiefly to white and yellow, though red is not wanting, as seen in the pink of the English daisy, Bellis perennis, the brilliant orange scarlet of the new Gerbera Jamesonii and the deep blues and purples of Centaureas and Cinerarias, but a porcelain blue "daisy" is something of a novelty. Arctotis grandis is a newcomer from southwest Africa and is best grown from seed as an annual, making a large branching bush two or three feet high. The downy-white foliage reminds one of the dusty miller, Centaurea Cineraria. The flowers are borne on long stems, and are two or three inches across, of the usual single daisy make-up. The color is bluish white, with a deeper blue disk. There is a little yellow at the base of the petals. The general effect is light porcelain blue, which is more pronounced when flowers are closed as they usually are in dull weather. The flowers are produced in constant succession all Summer. Although a little coarse in effect this Arctotis should make a desirable plant for mixed borders, and in time be improved as Cosmos and Dahlias have been. The blooms are lasting when cut, but close too easily to be very useful. Seeds for trial were furnished by H. A. Dreer, Philadelphia, Pa.

GERMINATION OF SWEET CORN.—Two blocks of cross-bred sweet corn planted at intervals of 10 days show a remarkable difference in stand. Soil, variety and conditions of planting were just the same, but seeds for one lot were kept over Winter in the dwelling, where the temperature probably did not go below 60 degrees at any time, while the other was wintered in a barn loft, where the cold reached close to zero on two or three occasions. Both lots were selected from the field at the same time, and thoroughly cured together, the only difference being the manner of wintering. The 10-day difference of planting seemed rather to favor the "cold" corn, as the season was advancing and rainfall abundant, yet the germination and vigor of the young plants was much inferior to the first lot, which had been kept warm and very dry. A single trial with different planting dates does not prove much, but it is well known that sweet corn is very sensitive to adverse storage conditions. Most planters find seeds of their own saving, when the selected ears are hung in a warm, dry place over Winter, grow better than "store seed"; and it is possible that the action of damp cold may be as prejudicial to the seeds as imperfect or hurried curing. Seedsmen have a difficult problem to keep their sugar corn seeds vigorous as well as pure, and in the main they handle it very well.

A RESISTANT EARLY CORN.—We feel justified in calling attention to Mr. Morse's endorsement of the Sheffield Sugar corn on page 597. We made this cross between Early Cory and Adams Early, a white dent hardy corn, much grown for the table in the South, 11 years ago in the hope of securing greater resistance to cold and an increased immunity from the dreaded smut. After careful selection for six years it was disseminated, and is steadily winning its way in the regard of practical growers in competition with the multitude of new kinds put forward with similar claims. We find it getting better every year under careful selection, and seldom care to plant any other early variety. An early planting of Sheffield and succeeding ones of Evergreen or Country Gentleman keep the table supplied with tender sweet corn from early July until frost. A single success of this kind among the multitude of recurring failures is sufficient encouragement to a hopeful plant-breeder. W. V. F.

PROF. MUNSON'S NEW GRAPES.

PART I.

The writer recently (August 5 and 6) made a visit to Prof. Munson, of Denison, Tex., to see and test his many new grapes. The purpose was to examine into their value, and compare them critically with best native standards like the Concord, Niagara, Brighton, Delaware, etc. Out of more than 100,000 seedlings that he has raised and fruited only 127 had been deemed worthy of continued culture. About 40 or 50 of the best of these were selected, and we then went to the vineyard and cut a fine sample cluster of each, including one each of the standards. Sheets of white paper were then laid upon the broad veranda of Prof. Munson's residence, and a cluster of grapes, properly labeled, was laid upon each, when the work of testing and comparison began. In cutting the clusters note had been taken of the vigor, health and prolificacy of the vines. The cluster of Concord was large and fine, better than the average of northern Ohio Concord grapes. It was also fully ripe, but the berries contained the well-known sour, tough and unpalatable pulp, constituting, with the seeds, from one-half to two-thirds of the bulk. From this cause more than half the people who eat the Concord grape swallow the seeds. The tissue surrounding the pulp was sweet, juicy and good, although having a foxy aroma peculiar to the Labrusca class, it became strongly manifest in comparison with the foreign and new grapes of Prof. Munson. There were also magnificent clusters of Campbell's Early and McPike further to make comparison. But both of these fine-looking grapes contained the same relative proportion of sour, tough and unpalatable pulp—a defect too serious to close our eyes to the possible improvement of our native grapes.

First comparison was of black varieties, Munson's America. Clusters as large as the largest Concord, more compactly set with berries and heavier, bulk for bulk. Berries with slight bloom, good medium size, almost pulpless and containing much coloring matter. Seeds few and small. Quality rich, pure, vinous, sweeter than the Concord, a fine table grape. The vine is very vigorous, healthy and exceedingly prolific, probably bearing a greater weight of fruit year after year than any other purely American grape. It is estimated that the fruit on the original vine this year will weigh 125 pounds, and the dense and beautiful foliage almost completely covers it from sight. Upon parting the leaves there was presented a beautiful view, and the most delightful aroma flowed out. Some of the new hybrids of this grape promise fully to equal it in yield, and may eclipse it, at the same time having finer quality, proving America to be a very fine mother for hybridizing purposes. The fruit keeps well, hangs well to the cluster, has a thin but tough skin, does not crack, and will stand long distance shipping. The finest port wine has been made from it. Parentage Post Oak and Rupestris only, and is hardy.

The Manito grape has long cylindrical clusters, a little loose but set very uniformly. Berries reddish black, above medium size and very prettily marked with circular dots of white bloom. The pulp readily frees its seeds, and has no unpleasant taste. Quality sweet, sprightly and vinous, far better than the Concord. This grape never cracks, and bears shipment well. The vine is very vigorous and highly prolific, bearing immense crops. Ripens with Moore's Early and is hardy. Parentage Post Oak, Rupestris, Labrusca and Vinifera.

The R. W. Munson has clusters much larger and longer than the Concord; berries same size, but very uniform in ripening. The quality is very pure and sweet, superior to its northern rival. The vine is a very strong grower, with a fine healthy leaf capable of fully maturing the great crops that it annually bears. The fruit never cracks, keeps well, ships well and sells well. Post Oak, Labrusca and Vinifera.

Bailey: Clusters very large and compact, larger and closer set with berries than the Concord, making the clusters remarkably heavy and attractive. The berries are as large as the Concord; do not crack, hang tightly, and are covered with a fine bloom. The quality is higher than the Concord and the seeds part more readily from the pulp, which is not unpleasant to the taste. It ripens evenly and the berries are of a very uniform size. It sells well and is a long keeper. Parentage Post Oak, Labrusca and Vinifera.

Beacon: Clusters very large and compact. The berries average larger than the Concord, are very firm, good keepers and will bear shipment well. The quality is fully as good. The bloom is not quite so heavy, but the larger clusters and berries command instant attention on the market. It is hardy. Parentage Big-berry Post Oak and Labrusca.
Ohio. G. L. TINKER, M. D.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

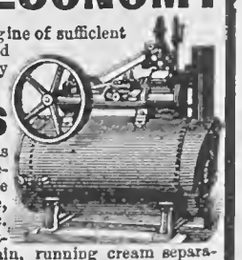
THE MIETZ & WEISS
Kerosene Engines
Cheapest and Safest Power Known. For pumping and electric lighting, grinding corn, separating cream, sawing wood, *and all power purposes.* Send for Catalog.
A. MIETZ,
128 Mott Street, New York.

CHARTER
Gasoline Engine
USED Any Place By Any One For Any Purpose
Stationaries, Portables, Engines and Pumps, Hoisters
Send for Illustrated Catalogue and Testimonials. State your Power Needs.
Charter Gas Engine Co., Box 26, Sterling, Ill.

POWER ECONOMY
consists first of all in having an engine of sufficient size to develop power cheaply, and large reserve force so as to run any machine easily and without drag.
Leffel Engines
excel in these things as well as others. Quick, easy steamers, require the minimum of fuel and are easy to operate. Ideal for farm use, creameries, small factories, etc. Unequaled for sawing wood, cutting feed, shelling and grinding grain, running cream separators, churns, pumps, etc. This one is horizontal—we make uprights also. Stationary and portable, 3 h.p. up. Send stamp for book. James Leffel & Co., Box 101 Springfield, Ohio.



Easy Harness
All harness, old or new, is made pliable and easy—will look better and wear longer—by the use of
Eureka Harness Oil
The finest preservative for leather ever discovered. Saves many times its cost by improved appearances and in the cost of repairs. Sold everywhere in cans—all sizes.
Made by STANDARD OIL CO.

HOPE FARM NOTES

This appears to be examination week for the Hope Farm man. The questions come in thick and fast, and I am not sure that I shall be able to "pass." We will try it anyway.

TAIL HOLDERS.—Here is a tale of a troublous tail from New York State:

We have a horse which has the habit, of years' standing, of catching the rein with his tail and hugging it very tightly; this habit took him off a narrow bridge and into the creek last night, when hitched to a reaper; no serious harm resulted, but the next wrong move may not prove so fortunate, and now will you tell me how the bad habit can be remedied? We have been advised to have his tail drawn tightly up over his back and left for 12 hours, when the ability to hug the rein will be removed and the horse not harmed. B. I.

Our old Major has just that trick. He is as expert with his tail as a boxer is with his arms. He will go jogging along apparently half asleep. The driver will touch him up with the whip, and quick as a flash that old brown tail will dart over one of the lines and hold it so tight that the horse will nearly turn himself around—especially when he is going away from home. We have done nothing for it except to hold the reins higher and watch his tail! A number of remedies are suggested. A single strap longer than the crupper may be buckled or tied around the tail about eight inches down from the root, and fastened tight to the back strap, so that the horse cannot crowd his tail down. The veterinarians, I am told, sometimes cut a muscle on the underside of the tail so that the horse loses power to press down upon the reins. This does not interfere with the side motions. I have heard of a loose bandage with tacks inside being placed around the tail so that when the horse tried to "grasp the lines" he would see the point at once. Now some one will get up and say: "Why don't you try some of these 'cures' on Major?" The fact is, that Major is too old a horse to do much mischief. The trick is not dangerous with him—simply annoying. With a younger horse I should certainly try "prohibition"—with knife, tack or strap.

FEATHERED CANNIBALS.—Here is a question that beats me:

I would like the Hope Farm man and other readers of THE R. N.-Y. to tell me how to prevent young chickens from eating each other. We have about 200 Black Minoreas that were hatched in an incubator in May and June, and for the last three or four weeks they kill and eat each other, as high as three in one day. They have a roomy house and yards 20x60 feet to each 50 chicks. They are fed a variety of food, and green cut bone once a week. Can anyone give me a remedy? S. H. O.

We have seldom had chickens act in that way. The little roosters fight sometimes until one is killed, and I have known the rest to eat the one that was defeated, but that, with us, happens only now and then. We found the Minorcas inclined to be quiet and peaceable—more so than the Leghorns. Several years ago a so-called "new breed" was offered, and it was claimed that they would kill and eat sparrows, rats and squirrels. These claims were pretty well founded, for the birds would fight like tigers. They had blood of the Javas in them. If I had these cannibals I would separate the roosters from the pullets at once, as I think the former are doing most of the mischief. As soon as they are large enough I would sell every rooster that is not wanted, feeding them more meat and keeping them either at large or in smaller flocks. I do not think the pullets alone will do much damage.

DAMAGED WHEAT.—The following letter comes from Pennsylvania:

What would you do in my case? I have 300 bushels of wheat damaged by rain. Millers only offer 40 cents per bushel. I do not want to sell it for 40 cents, and I purpose to feed it to hogs, horses and cows, using oats and corn, along with good corn fodder and bright oat straw. Give me a balanced ration out of this feed, or should I feed something else along with it? A. S.

That wheat is certainly worth more than 40 cents a bushel. If I had it I would lay aside 100 bushels for chicken feed. We have never found anything better than whole wheat for chickens. I would take 50 bushels more for feeding little pigs and shotes. Scatter it in the yard or pasture where the pigs run, and they will get every kernel of it. Some people think a pig cannot pick up such a small grain. What a mistake! That wonderful under jaw of the pig will pick up clover seed if need be. I met a man out West who feeds all his wheat in this way, and the pigs pay him more than the millers. For work horses and cows I would grind two parts wheat, two parts oats and one part corn. For hogs I would leave out the oats, and grind equal parts of corn and wheat. Oats are for the workers, and the cow works as hard as the horse does. This feed, with good, bright cornstalks, will make a fair ration, but as I am situated it would pay me to feed in addition to each cow daily a pint of oil meal, and the same to the horses three times a week.

GRUBS AND POTATOES.—The following note came from North Carolina with a sample of the insect:

I planted a small piece of land in potatoes which proved productive of fair-sized tubers, but a "grub" or some kind of a black-headed worm has eaten them three-fifths to such an extent that they are ruined. Can you give me the name of the insect and state a remedy? Sample of potato and grub mailed under separate cover. W. J. W.

The insect proves to be the common white grub. Our own potatoes are alive with them. We have found one or more in every hill thus far, and they are likely to get more potatoes than we are. I have seen them on potatoes before, but never knew them to do so much damage as they have this season. They have destroyed the strawberry plants, but have not seriously damaged other crops for me before now. I regret to say that there is no practical way of fighting them. Of course the potatoes should be dug as soon as they are ready. Constant cultivation through the season will set the teeth of the next generation of white grubs on edge, and Fall plowing, leaving the ground exposed, will kill out many. But what is the use of talking "constant cultivation" when you can't get into the field without rubber boots? I regret to say that you will have to let those white grubs fatten on the tubers until they are ready to dig.

CLOVER HAY.—Another farmer in Pennsylvania presents this problem:

Last Spring we seeded a six-acre lot to barley, and with it one bushel of clover and one of Timothy seed. At this writing we have the finest growth of clover I ever saw. What shall we do with it? It is now in full bloom. Shall we pasture it, make hay, or let it fall on the ground? If the latter, I fear the plants will be smothered out. It will be a difficult task to make hay at this time, as we are having so much wet weather. How would you handle it if it was on Hope Farm?

J. T. R.

If I had that clover I would do just as I shall try to do with the clover in the orchard—cut it when ready. I need more hay. I don't believe in letting the first growth of clover die down. I would clip it anyway even if I had to leave it on the ground. We could feed a good deal of it to the stock without curing. It is not so hard to cure clover hay in damp weather if we go at it just right. The "curing" must be done in cocks, and it won't do to let it go half-cocked, either. In good-sized firm piles the clover will "sweat" out much of the moisture in the stems—provided the leaves are not dried out early in the game. I would feed such clover out early to the cows, but I would try to cure it anyway.

FROGS AND MUSHROOMS.—Here is a Jerseyman with a suggestion for some of the agricultural croakers:

Can you give me any information about the raising of frogs for market, or can you direct me as to some reading by which I can receive such information? I shall be grateful if you can give me some knowledge of the business. I also wish to learn something about the cultivation of mushrooms. E. L. J.

The best information I can give is that "frog farming" is one of the theories that burst at a puff of practice. There is a fair demand now for frog's legs in the best markets, and it is a favorite scheme for the man who knows nothing about it to figure the vast profits of frog farming. It looks easy, but the trouble with frog farming is the fact that Mr. Frog himself is remarkably fond of frogs' legs! It is quite easy to hatch out the little fellows, but almost impossible to protect them from their relatives. The older frogs devour the little ones and ruin the business. A pamphlet on frogs will be sent on application to the United States Fish Commissioner at Washington. Of the great quantities of frogs that come to market practically all are caught one at a time in ponds and streams. A book that will give you an idea of mushroom culture is, Mushrooms—How to Grow Them, by W. Falconer; price $1 from this office. We have never attempted the culture of mushrooms. I have seen them growing in dark cellars, but have always felt disposed to leave their production to those who are specially fitted to handle this special product.

LOAFING HENS.—Here is a man from North Carolina with a question that never dies:

What would you advise to make hens lay that have open field and woods to run in? We have about 15 and hardly get an egg a day. O. J. H.

I don't believe you can make those hens lay until they get ready. We have now about 35 hens, and they lay from four to six eggs per day. They have begun to moult, and we presume your hens are also calling in Nature's dressmaker to fit them with a new Winter's suit. An old married man with several years' experience in family matters will tell you that when Mother and the girls are getting ready for the dressmaker he must expect plain fare and little attention. He will tell you that it will all be made up to him later when those dresses fit. It is about so with a hen. Some people tell how easy it is to crowd a hen through her moulting season and make her forget that she ever had feathers, but I have never been able to do it. We have fed meat, sunflowers and oil meal. A few of the hens seemed to lay even when they were so bare that they had no place under which to lay their head, but most of them shut up shop completely no matter what they are fed. My opinion is that those hens will do little laying beside laying off until they get their new clothes on. I should either line my soul with patience and wait, or line the stomachs of my family with chicken pie—and wait not!

FARM NOTES.—The rain still keeps up. A day without at least one shower is as rare as an angel's visit is said to be—though most of us entertain angels unawares every hour. We have scarcely been able to turn a furrow all through August. I hoped by this time to have the wheat land all plowed at least. The lower part of the farm is nearly knee deep in mud. We have cut off the weeds where we could not plow them or pull them up. . . . The second cutting of the "Clark" grass will not amount to much. Rain and fertilizer will do much, but they cannot do it all without sun, and grass will not give satisfaction unless the sun shines on it. . . . The corn crop is very promising—that is, the stalks are tall and of good color. We shall have a large amount of fodder, but unless the weather changes, it will be impossible to cure it properly. The grain is forming well, though I shall not be surprised if there are few kernels on many cobs. . . . Lima beans and melons are largely grown by farmers in this section, but this year they are minus quantities. In former years we have made entire meals out of Lima beans and bread and butter, but this year the best we can make is a "succotash" of sweet corn and a few Limas to give it a little color. However, we don't starve—not by a good deal. There are 25 or more young roosters out in the coop, and a sure supply of apples, plums, pears, beets, cabbage, onions, potatoes, peppers, tomatoes and turnips. We have had from 12 to 17 people in the family all Summer, and so far as I know they have all had enough to eat. . . . Few have skipped a meal, for in spite of the constant rain, the soaking ground and a wet cellar this has been a healthy Summer. We have had no serious sickness. On the other hand, Hope Farm has been able to provide a refuge for several good people whose nerves and muscles gave out in the fierce strain of fighting society for a living. They will go back to their work with clearer eyes, stouter hearts, well-packed bones and a little bunch of the Madame's faith and hope under their jackets. If I could put a market value on some of these things we could figure out a fortune this year. H. W. C.

To Users of Fertilizers

we recommend our books. Over a quarter of a million of these have been sent to American farmers—upon their request.

They are **free,** and we desire every farmer's library to contain them.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, SEPTEMBER 7, 1901.

THE Canadian census returns are said to be disappointing to those who give most thought to the future of Canada. Quebec and the western provinces have made fair gains in population, but Ontario and the maritime Provinces are nearly at a standstill. It is hard to understand why Canada does not gain more rapidly. Ontario is a most desirable section for fruit growing and general farming. It is filled with good farmers, and the market facilities are excellent. Some Canadians profess to be satisfied with this slow growth, but it is certainly not up to the standard of Yankee enterprise.

*

SOME of the electric railroads that reach out along the farm highways are beginning to carry freight. As a rule, they give quick service at a fair price—in fact, they haul freight at express speed and about half the express charges. Of course, the steam railroads and express companies object to such freight carrying. They have had a monopoly of such business for years, and do not look with favor upon any competition. Such service is, however, of great value to the farmer, and we hope it will be extended all over the country. All such things make country life brighter. The farmer should be able to send his voice over the telephone and his crops over the trolley.

*

THE Department of Agriculture is preparing to publish a digest of the game laws of this country. This work will be appreciated not only by sportsmen, but by farmers and others who wish to take a day or two off during the year for a little hunting. The game laws are so complicated that something up-to-date and covering the whole country is needed. Most States have strict laws against exporting game, many require non-resident hunters to get a license costing from $10 to $40, and some prohibit the sale of all kinds of game. We feel sorry for the man whose duty it was to digest and arrange these complicated and conflicting game laws. He must have a bad case of mental dyspepsia!

*

LET us suppose that a large and powerful trust or combination of business men secured control of the marketing of farm products. It became known to farmers that it was the intention of these strong men to do what they could to break down the power of the Grange or of other organizations which endeavored to secure the rights belonging to the farmer. Would the producers be justified in organizing a strike for the purpose of maintaining their right to organize as they saw fit? The consequences of a general strike among farmers—that is, a general refusal to crop their land—would be worse in its effect upon humanity than the most awful war in history. Would they ever be justified in using this tremendous weapon?

*

A FEW weeks since we said that the time may come when the automobile will be trained to farm labor. It ought to carry the farmer's family or load along the road and then stand on its front feet and turn machinery with its hind legs. Since then we have heard of a case where this has actually been done. A city man with a powerful automobile goes to the country to visit his farmer friend. At the farm the auto is backed into the barn and well braced. The rubber tires are taken from the hind wheels and the back end of the vehicle raised. A belt is attached to the hind wheel and used to turn a fodder shredder, or mill, or to work the pump. This auto is a strong one, with six horse-power. Such a machine is too expensive for the average farmer, but it shows the possibilities of the steel farm horse. These machines are sure to be sold at a reasonable price some day—following the development of the bicycle and the traction engine. We understand that a patent has been issued for a special device for enabling the auto to kick at machinery with its hind legs. Thus the horseless carriage, like the telephone and the trolley, may yet serve the farmer as well as the city man.

*

THE fearful damage done by the Hessian fly this year has made the study of that insect doubly interesting. Washington was the first American farmer to make the Hessian fly. His favorite remedy was the "trap system," and he used it with great success at the Battle of Trenton. He studied the habits of the Hessian and knew that he was sure to "emerge" at Christmas and get into such a condition that he could be easily handled. So he waited until the Hessians were spread out thick on their Christmas celebration, and then he crossed the river and fell upon them like a thunderbolt! The plan which the entomologists suggest for this season is therefore older than our present Government. Briefly stated, it is to sow a strip of wheat early in September. In consequence of the wet season the "fly" will "emerge" early. He will get to that early wheat as the Hessian soldier surrounded his Christmas cheer. He will be just about as helpless, and can easily be plowed under and destroyed. This is a specially good season for the farmer to emulate the Father of his Country.

*

THE daily papers have printed great stories of tobacco growing in Connecticut. We receive letters from western readers who ask if it is true that tobacco is being grown under great tents in the Connecticut Valley! Yes, the statements appear to be correct. Last year Dr. E. H. Jenkins, of the Connecticut Experiment Station, conducted some experiments in growing Sumatra tobacco under shade. The quality of the tobacco was so fine that this year about 30 acres of this tobacco are being grown under cheesecloth shade, with every prospect of great success. One grower is reported to have surrounded his entire patch with mosquito netting to keep out the grasshoppers. The profits from these tented tobacco lands are almost past belief. The Government went ahead and experimented, and the growers had the nerve to follow on a larger scale. What would the grandfathers of these Yankees say could they see these great tents stretched over their old fields? They would probably say that the modern Yankee doesn't need to go away after a job on the farm, and that he has sharpened and polished his grandfather's brains!

*

AT the annual meeting of the Five States Milk Producers' Association the following resolution was passed:

Resolved—That we, the members of the Five States Milk Producers' Association, in convention assembled, knowing the danger to the dairying interests of the country and to the health of the community implied in the production of 100,000,000 pounds of oleomargarine yearly, all of which is sold as butter, and realizing the injustice both to the butter producers and consumers in the fraud perpetrated, ask our representatives in Congress to work for the passage of the so-called anti-oleomargarine or Grout bill, if introduced in Congress next Winter, or for any substitute therefor.

That is good as far as it goes. Of course, the bill will be introduced into Congress. Let there be no "if" about it. But what will be the sense of "resolving" in this way if J. W. Wadsworth is again appointed chairman of the committee on agriculture and permitted to hold the bill up once more? If the road is muddy and we see a log across our way we do not lash the horses, but we get out and chop away the log. Chairman Wadsworth is the log in front of the anti-oleo bill. The thing to do is to chop him off. Where is your ax? The pen is mightier than the ax. Write a letter to Hon. D. B. Henderson, Washington, D. C., and tell him that you want no one but a friend of the farmer on guard.

*

MOST farmers are familiar with the history of Jersey and Guernsey cattle. They were kept on their little islands for many years, and carefully protected from any outside blood. The type was thus narrowed, and uniform specimens were produced which when taken elsewhere for breeding purposes were sure to stamp the strong points of the breed upon their offspring. It is not generally known that much the same thing is being done with sheep in Maine. On certain islands near the Maine coast sheep have been bred for years. No new sheep are brought from the mainland, but the best specimens of the island sheep are reserved each year for breeding. The sheep have slowly changed from the former type and now have original and valuable characteristics which make them really a new breed. They are wonderfully hardy—spending the Winter in good condition with little to eat but seaweed and fish. It is now proposed to keep these sheep pure—that is, to introduce no outside blood, as it is thought that for some purposes they are superior to most other breeds. We expect to have some articles later on these thick-coated wool-backs.

*

THE bicycle side-path law in force in New York State is an excellent thing so far as it goes. Riding on these paths without a license is a finable offence. Licenses issued in any county are good through the entire State, and a badge is furnished which can be attached to the bicycle. Some counties charge 50 cents and others $1 a year, the money being used to improve the paths. If this tax were doubled and the funds properly used, still more improvement might be made, and it is probable that most wheelmen who use these paths would willingly contribute this amount to a work which is of such direct benefit to them. A bicycle is a nuisance among the wagons on the highway, and it is a comfort to horsemen as well as wheelmen to have a separate place for each.

*

IRRESPONSIBLE publications often contain advertisements purporting to come from some "detective agency," which asks for local representatives whose efforts will cover the localities in which they live. Boys who have fed their imagination upon trashy fiction are much impressed with the glory of becoming amateur sleuths, after the manner of their favorite heroes, and they cheerfully hoard and save to obtain the deposit required as a preliminary by the agency. One New York lawyer tells how, when he was a boy, he managed by strenuous efforts to save $2, which he sent to one of these advertisers. In return he got a nickel-plated star as big as a saucer, and a set of credentials setting forth his official dignity. He says:

> My territory was a peaceful agricultural district some six miles square, and I was to ferret out all crime in that district. I pinned the star in my flannel shirt and went around looking mysterious and wise. But the only disturbances in my town were occasional cases of bucolic drunkenness, and after a month or so I sold the star and credentials to another boy and went out of the business.

Another similar agency is a so-called bureau of newspaper correspondence, which operates on similar lines. After advertising for "reporters" in different districts, it demands a fee, merely as a "guarantee of responsibility." Paying such fees is a form of education for the unsuspicious, but a disheartening one.

*

BREVITIES.

The pleasant town of Get There lies far up a rocky hill,
Across the sands of Courage and above the swamp of Will.
The path that leads to Get There leaves the pleasant thoroughfare
And wanders off 'mid rocks that grind and brier vines that tear.
And thousands pass along the road that leads to Nowhereville,
And grumble at the few who climb to Get There on the hill.
And others start the thorny path and seek the town to gain,
But falter at the swamp of Will and turn them back in pain.
Oh, happy town of Get There shining in the morning sun,
You only show the toiler how yet higher peaks are won.
The truest recompense you give for self-denying years
Is but the promise old, yet new, that conquers doubts and fears.
For no one lives at Get There, but with heart and purpose set
On better things, from peak to peak, they climb up higher yet.

SET a trap for the Hessian fly.

EGGS lose weight when cooked.

WHAT is your farm doing for humanity?

THE first crow of the young rooster is crude.

THE customary order for the apple pie is last.

THE general-purpose man needs more private purpose.

THIS is no season for bush Lima beans. How they do rot!

PEA flour mixed with wheat flour is recommended for bread making.

THE shell makes about 15 per cent of the weight of the Guinea fowl's egg.

BETTER be original in the primer class than a parrot in the third reader.

THE "old home week" is a strong feature of New Hampshire rural life.

THE account of Prof. Munson's grapes, page 614, will interest many fruit growers.

CURE a little of the finest clover rowen this Fall to feed the calves and hogs during the Winter.

IT seems to us that there is a good opening for bright young men in the study of scientific forestry.

A CYCLONE in Pennsylvania was followed recently, according to veracious observers, by a shower of string beans.

NOTE Mr. Morse's directions for preparing a blackboard, on page 613. That paint formula is a good thing to know.

"YES," remarked the weather, "my surroundings have been very *August* for the last 31 days, but now I'm in for a Fall."

NO, we will not seed to grass on land so wet that we could not kill out the weeds. We will seed to rye or wheat alone, and wait for a better weed-killing season before sowing grass seed.

Events of the Week

DOMESTIC.—Jack Winters, who stole $283,000 in bullion from the Selby smelting works, Vallejo, Cal., and afterwards confessed and disclosed the hiding place of the plunder, was sentenced August 21 to 15 years' imprisonment. Winters asserts that he had no accomplices. . . . . Five men were drowned August 21 as the result of an explosion in the tunnel under Lake Erie, at Cleveland, O., where another casualty had occurred a week before. . . . . In a head-on collision between a passenger and freight train at Prentice, Ill., August 21, five trainmen were killed and six badly injured. . . . . August 24, severe storms and cloudbursts occurred in several localities in New York, New Jersey and Pennsylvania. At Mauch Chunk, Pa., flood swept away a pavement on which a man and three boys were standing, drowning all four. . . . . The explosion of a soda fountain at Ashley, Ind., August 26, wrecked a drugstore, killed one person and fatally injured another. . . . . The falling of two steel girders of a new railway bridge being built across the Congaree River, near Columbia, S. C., August 26, killed four workmen and injured three others. . . . . The Attorney General decides that newspaper guessing contests requiring study and calculation do not fall under the law prohibiting the advertising of lotteries or games of pure chance. . . . . The Government has discovered wholesale smuggling of Chinese over the Mexican border at Nogales, Ariz., where corrupt officials have been selling certificates. One of the implicated officials committed suicide.

PHILIPPINES.—The insurgent Colonel Loreel, with 17 officers and 73 men, has surrendered at Talisay. The military force at Manila is to be increased to 1,000 effective soldiers to guard against any possible uprising. It is expected that with the opening of Congress, the Government will submit a bill providing local self-government for the Philippine Islands. The measure is understood to follow the lines of the government maintained by Great Britain in the Straits Settlements. The subject of franchises will be the most difficult to settle.

FARM AND GARDEN.—A decision handed down August 21 by Judge McConnell, sitting at Cleveland, Tenn., dissolves the injunctions granted two weeks before in a case involving $5,000,000 invested in the copper industry near Ducktown, Tenn. About 40 farmers asserted that their land had been ruined by the copper fumes and that vegetation was being destroyed. Suits for damages were filed, injunctions were granted and the plants of the companies were shut down. The feature of the hearing preceding the dissolution of the injunction was a petition signed by 3,000 citizens of the county, asking that the industry be not interfered with. The companies concerned are the Tennessee Copper Company and the Ducktown Copper Company. The first has spent $3,000,000 and employs 2,000 hands. The latter has spent $1,000,000, contemplates the immediate expenditure of $4,000,000 more, and employs about 1,000 hands. Individual suits will be heard at the September term of court.

John Hyde, the Statistician of the Agricultural Department, returned to Washington August 21 from a tour of the countries of Europe, where he arranged for a system for the exchange of telegraphic crop reports.

Capt. G. P. Ahern, of the Ninth United States Cavalry, who is in charge of forestry work in the Philippine Islands, by resolution of the Philippine Commission, is in Washington to examine applicants for positions as foresters, September 9. Six foresters, with salaries from $150 to $200 per month, are to be appointed. One of the qualifications is that applicants shall be graduates of forestry schools.

Live stock shows will be held at Atlanta, Ga., October 14-24; at Chicago, Ill., November 30 to December 17, and at Philadelphia, Pa., October 8-19.

The annual fair of the Michigan State Agricultural Society will be held at Pontiac September 23-27.

The Wisconsin State Fair will be held at Milwaukee September 9-13.

The Tompkins Co. (N. Y.) Agricultural Society will hold its sixty-second annual fair at Ithaca September 17-20. A night carnival will be held in connection with the fair, this being a novelty.

The first Louisville (Ky.) Inter-state Fair will be held September 23—October 5.

The second International Live Stock Exhibition will be held at the Union Stock Yards, Chicago, during the first week in December. Entry blanks are now ready. If intending exhibitors of pure breeding, and fat stock, and horses, will make application for them to W. E. Skinner, General Manager, International Live Stock Exposition, Union Stock Yards, Chicago, stating how many animals they desire to enter, and the class or breed, it will greatly expedite matters in the office, and they will receive their many entry blanks promptly. Carloads of live stock do not need to be entered until arrival at the Union Stock Yards, Chicago. Premium lists will be sent out with the entry blanks only on request.

The Western New York Horticultural Society, as the trustee, has awarded the Barry medal to Charles C. Hooper, Rochester, N. Y., for the new red currant, Perfection (cross of Fay's Prolific and the White Grape), combining mild, rich flavor of the latter with size and appearance of the former, with larger bunches and more of them than the Fay. The medal is offered a new fruit, ornamental shrub, tree, flowering plant or vegetable which, after a three years' test, shall be considered worthy.

The Cape Cod Cranberry Growers' Association held its annual meeting recently. Nearly every town in Barnstable County was represented, and a large delegation from Plymouth County was present. It was estimated that the crop this year from these two counties would be about 20 per cent less than last year, when the output was 175,000 barrels. It was the sense of the meeting that berries should not sell for less than $6 per barrel at the outset. Emulus Small, of Harwich, was reëlected president; George R. Briggs, of Plymouth, vice-president; Franklin Crocker, of Hyannis, secretary-treasurer.

R. J. Warder, secretary of the Board of Control of the Ohio State Experiment Station, is appointed Superintendent of Parks in Chicago, Ill. He was at one time a member of the Park Board of Cincinnati, O.

Louis Cusin, secretary of the Pomological Society of France, and for many years a prominent figure in French horticulture, died on August 1 in his 78th year.

The St. Louis World's Fair, 1903, purposes to make a very special feature of agriculture and horticulture. The Committee on Agriculture was formed with the special object in view of gathering together in the St. Louis World's Fair Grounds of 1903 the most magnificent and complete exhibition of horses, cattle, sheep, swine, poultry, farm products, horticulture, forestry, etc., ever exhibited.

The twenty-eighth annual Grangers' Interstate Exhibition and picnic was opened at Williams Grove, Pa., August 26. The machinery exhibits were larger than ever before. Among the speakers were officials of the State Department of Agriculture; Aaron Jones, of Indiana, Worthy Master of the National Grange; W. F. Hill, Master of the Pennsylvania State Grange, and J. B. Rogers, of New Jersey.

The Connecticut Pomological Society will hold its fourth annual fruit exhibit at New Britain, Conn., October 1-2.

The American Veterinary Medical Association met at Atlantic City, N. J., September 3-6.

The Devon Cattle Club offers a special list of prizes at the Pan-American Exposition, which will be of interest to Devon breeders generally.

The Holstein-Friesian Association will duplicate all prizes offered by the New York State Fair Commission in the butter-fat test, provided the prizes are won by recorded Holstein-Friesian cows, thus making a total of $500 if won as above. Arrangements have been made with the officials of the Pan-American Exposition whereby all cattle to be shown at Buffalo may remain at the State Fair in Syracuse until Thursday evening, September 12, at which time they will be sent by special train to Buffalo. Judging cattle at Buffalo will begin Monday, September 16. Prize lists may be obtained from Frank D. Ward, Empire House, Syracuse, N. Y.

FARM VALUES.

Farms in this vicinity have depreciated in value fully two-fifths from what they were worth 15 or 20 years ago, owing to the fact that farm produce does not bring more than one-half as much as it did 15 years ago. For example, wool sold for 33 cents, now 16 cents; wheat from $1.25 to $1.40, now 70 cents; barley from 75 cents to $1, now 50 cents; while the cost of production is just as much now as it was then. The difference in the prices now and 18 years ago ought to make from one-half to three-fourths difference in valuation of farms. The only cases where there has been any increase in valuation have been on account of buildings being improved, and fences built and kept in repair. J. S. B.

Ontario Co., N. Y.

We have read the articles published in THE R. N.-Y. from time to time on the subject of run-down farms, and more recently on the depreciation in farm values. The location of farm property has much to do with its value and its capability to produce. A farm located in this tobacco belt is worth more to-day than for years preceding. The tobacco industry was never more promising than at the present time. A new feature of the cultivation is the growing under canvas, and many acres have been grown in this way this season. An experimental piece was grown last year which was sold at about 60 cents per pound for wrappers, while that not shade grown brought from 25 to 30 cents per pound. This tobacco was grown under the supervision of an expert furnished by the Government, and proved so much of a success that acres and acres are this year grown under canvas. D. K.

Hartford, Conn.

It is my opinion and that of others who have lived here longer than I have, that farm values will not average to exceed 40 per cent of what they were 20 years ago, although the buildings, etc., are generally much improved since then and the farms in fully as good a state of cultivation. This for our immediate neighborhood. A little north and west of us the decline has been much more even than here. I know of no case where there is any increase of values nor of any farm that will bring 60 per cent of the supposed value of 20 years ago. It is very rare that there is a farm sold unless it is by the mortgagee. I did not sow any cow peas this year owing to want of time and the wet season, but there are a few growing that came up after plowing the orchards. They have mostly made a very fine growth, much better than last year. I have two bushels of seed saved from last year that I expect to plant next season. S. D.

Greene Co., N. Y.

For the last 15 or 20 years farm values have steadily advanced. Land which sold then for $25 to $35 now sells more readily at from $35 to $45. This is land without permanent improvements to speak of. An 80-acre adjoining mine, without permanent improvements, was bought in 1880 for $35 per acre. The same farm was sold last Winter for $65, with about $1,500 permanent improvements. A 160-acre farm adjoining mine was bought about 18 years ago for $6,000, and was sold last Winter for $10,000; the improvements are worth probably $500 more now than then. About my own farm I do not know what it would sell for. But the assessor puts a higher value on it than any near it. I bought it 29 and 18 years ago, at about $25 and $30 per acre. I do not know that the advance has been greater for the last two years than the average, but more land has changed hands than at any time before. The farms I have spoken of are two and three miles from the railroad; six to 10 miles back land sells from $40 to $50 per acre. J. S.

Corning, Iowa.

Farm land has dropped in value about one-third, and is not changing owners. About the only sales that I can report are in settling up estates. Land in this section is yielding larger crops at the present time than years ago; everything in farm production is bringing a good price except wheat, which is worth 70 cents; old corn, 60 cents; oats, 45 cents and none to sell; a complete failure. One farmer got 80 bushels from 20 acres. Potatoes, $1 a bushel; hay, $12 a ton; rye, 56 cents; horses, $150 to $200; cows, $30 to $50. Everything in good demand; butter, 28 cents; eggs, 16 cents. The reason for land producing more I credit to late improvements and information gained by our young people through farm papers and institutes. I can call to mind farms to-day that yield three times the amount of grain that they did 20 years ago. These farms passed into the possession of young men who are using any amount of commercial manures, and have learned what to use and how much; have also learned how to handle barnyard manure. We are having plenty of rain at present, which is helping out our late planted corn. I planted 16 acres June 6, and before the rain I put it down as a complete failure, but it is earing all right and promises well. On the other hand, all corn planted early will be a short crop. The buckwheat in this section is looking fine and promises to be a good crop. A great many farmers take off buckwheat and sow wheat on same ground. In 1899 I sowed wheat on buckwheat stubble and harvested grain that yielded 34 bushels per acre. This wheat was sown October 2.

Columbia Co., Pa. E. H. S.

It must be admitted that farm values have steadily declined during the last 15 years in our vicinity, except where some other consideration than that of farming had kept up the price of land in favored areas of limited extent. Good farm land now within a radius of three miles from Harrisburg sells at from $80 to $100 per acre, while 15 or 20 years ago such land sold from $100 to $150 per acre. As to whether the sales from the farms are equal to those of 20 years ago, we believe they are not where the farmer depends largely upon the sale of the cereals for his revenue, but that they are where successful dairying or gardening is combined with the raising of grains. In our judgment the Pennsylvania farmer of 100 acres cannot compete with his western brother, who farms perhaps 1,000 acres in raising grains. He needs nearly the same appliances, requiring almost the same investment, and has much less use for them, and consequently receives much smaller returns from the same investment. The farmer here must depend largely upon fruit, vegetables or milk if he would make his farm pay. Many are doing this and succeeding. Our farmers in general here complain that they cannot make money as they could years ago; but even those who complain will point out a farmer here and there who has changed with the times and admit that he is making money. Farmers of this sort are not the ones who sell out for $80 or even $100 per acre. J. G.

Progress, Pa.

CROP PROSPECTS.

AUGUST 19.—Hay, good; oats, half crop; apples a failure. Corn, 75 per cent; potatoes looking fairly well, but only a few in a hill. Buckwheat never looked better. Rye about 11 bushels per acre; grapes good. L. M. S.

Yates Co., N. Y.

AUGUST 25.—We have had heavy rains here this Summer that have done damage by washing side hills, but it also made crops grow wonderfully. No apples near here; every peach tree full. Late potato tops look well; no early ones planted on account of wet Spring. Buckwheat and corn look very well. Meadows as green as June. Bees are gathering honey from buckwheat and Fall flowers. F. W.

Center Co., Pa.

AUGUST 22.—Oat harvest nearly completed; the crop greatly injured by rust and some smut. White Russian oats I treated with formalin and sowed May 25 are well filled, and no smut or rust visible. Corn planted June 5 is over 12 feet high and heavily eared. Many silos are being built in this section now. Last Winter the silage from 3½ acres fed 14 cattle five months, without other feed, and left them in fine condition. There is but very little fruit of any kind here. Grasshoppers are very thick. Numerous heavy showers. Beans are not filling well. J. S. B.

Allegany Co., N. Y.

Crop and Weather Report.

During the past week the Middle and South Atlantic States have suffered from heavy rains, which have damaged crops and hindered work, and in some instances washed the land severely. The drought still continues in Iowa, Oklahoma and Texas. Great improvement is noted in the condition of late corn. Much heavier earing than was anticipated is reported in the Central West and the Ohio Valley. The last of the Spring wheat harvest was hindered by rains, but is now practically finished. Thrashing is in progress and yields are satisfactory except in North Dakota, where the grain ripened prematurely and the kernels are shrunken on account of excessive heat. Shedding and rust are reported throughout the cotton belt. Tobacco prospects are favorable in the Ohio Valley and Tennessee. The apple outlook in Illinois, Indiana, Arkansas and Missouri is improving. Plowing is in progress in the Central and Eastern States, where the ground is in condition to work.

The Milk Producers.

The annual meeting of the Five States Milk Producers' Association at Binghamton, N. Y., resulted in the election of President, Ira L. Snell; vice-president, T. J. Arnold; secretary-treasurer, H. T. Coon. Executive committee—J. C. Latimer, Ira L. Snell, H. T. Coon, F. B. Aiken and O. G. Sawdy. After four years' work the Association has a cash balance of $108.48. The following resolutions were passed:

We affirm that the present net price of milk paid to the producer, which is now on the basis of the Milk Exchange only about 1¾ cent per quart, is insufficient.

Resolved—That in view of the prices of hay, grain and all products that enter into the production of all dairy food and the certainty of a great advance in the near future, we do not deem it expedient to fix a valuation on the same to govern the action of our members until our coöperative stations are so united that they will stand together as a unit in sustaining the price set by the committee, recommending to all that they carefully calculate the cost of producing the same and demand a remunerative price to cover cost and a fair compensation for labor, and all sales should be made subject to the demand of the milk by a F. S. M. P. A.

Resolved—That we unhesitatingly earnestly recommend and advise that our members shall refuse to make any contracts for delivery of milk to dealers.

We reaffirm our desire to coöperate with all efforts to procure clean, pure milk for the consumer by greater care in the production, and the prevention of skimming and adulterating of the milk before it reaches the consumer.

We heartily welcome the action of the medical society in New York in its endeavor to secure healthy dairy foods for the people of the city, and pledge our help to that end.

Woman and Home

From Day to Day.

DISAPPOINTMENT

Good Fortune in disguise
Crept shyly to my door;
Want in her haggard eyes,
Grief in the garb she wore.
How should I know the guest
Who came so poorly drest?

With fear I let her in
Who would not be denied:
No greeting did she win
No welcome to my side—
This uninvited guest,
Who stole away my rest.

But in the morning light,
Another face was there;
I saw a visage bright,
A beauty strange and rare.
My dear, deceitful guest
Had put my faith to test.

Now Joy and I are friends,
Who thought to be estranged;
Now Fate hath made amends,
And all the world is changed.
For since I knew my guest,
I find her gifts the best.
—F. W. Clarke, in the Independent.

*

A GIRL may be permitted to long for the unattainable if such longing does not induce her to pass all the housework over to her mother.

*

ONE experimenting housekeeper has decided that the proper way to lay matting is to sew the widths together like carpet, instead of fastening the joins down with double tacks. This would certainly simplify the taking up of the matting, preventing tearing, but it means a good deal of extra work.

*

KNITTING or crocheting small shells into drapery makes a picturesque material for decorating. At the Florida beaches last Winter many young women found this a pleasant occupation. The small pearly shells were gathered, the sort that is usually found with a little hole in each; if such was wanting, it was supplied. They were then caught regularly in the meshes of a coarse silk crocheting, a strand of rich yellow showing with a specially good effect. Red and gray were also used. One industrious woman knitted a long curtain, measuring three yards, in this way. The same shells are to be found at many northern beaches, and the experiment may be tried in Summer as well.

*

A VERY useful piece of furniture described by the Boston Beacon is an ex-ironing table. This is one of the tables bought in the shops for from $2 up and which with the broad table tipped back forms a high backed settle with a deep box below the narrow seat. The tables are in the natural wood without finish when purchased. The woman who finds hers of such value painted it green, upholstered it by tacking a covering over a thin stuffing upon the back and seat, and now the settle is a picturesque feature of her dining-room. When the back is turned down for a table it is most convenient for cutting or work of different kinds, and the box under the seat holds any number of things for which there seems to be no other place.

*

THE Norfolk jacket is with us again, and makes a nice useful suit with a walking skirt, especially suitable to an unformed or girlish figure. The jacket is made with a yoke back and front, one pleat running from the yoke to the lower edge of the jacket in the back, the belt outside this pleat, and two similar pleats in front, with the belt passing under them. The newest of long skirts is called the serpentine, which is something like a revival of the old bell skirt. It tapers down to just below the knees, where it flares out very full. Many of these skirts have a flounce, not very deep in front, but rising to a much greater depth in the back. Of course such a skirt needs a swirl of ruffles under it from the knees down, to make it hang properly. This is the reason, no doubt, why the short walking skirts are now cut without the flare, because no one wishes to wear a chaos of frills under a garment designed for bad weather or active exercise.

*

TOAST-making appears a very simple art, yet many housekeepers never seem to strike the right medium between flabbiness and cinders. If the bread is very quickly browned over on the outside, the interior remains damp, and we find that the butter lies on the top in the form of hot oil. To make good toast, the slice of bread should first be warmed on both sides without browning, and then browned slowly. Properly, dry toast should never be laid flat upon a plate, because the condensing steam makes it damp and tough, but toast racks, in which the slices are held on edge by vertical bars, are rarely seen on American tables. The toast rack usually forms part of an English breakfast service, being made of china or silver.

*

CATSUP making is upon us, and we simplify the work very much by seeing that bottles, corks, sealing wax, etc., are all at hand, and in good condition. Soak the corks in boiling water; drive them well into the bottles while they are still hot, and then cover the cork with sealing wax. Over this tie two thicknesses of cloth, and then saturate the cloth with wax. Seal the catsup while hot, and when cold put in a cool, dry, dark place, resting the bottles on their sides. Cook catsup in a granite or porcelain kettle, and stir with a wooden or silver spoon. We like to make catsup early in September, before the fruit gets watery, yet try to avoid very warm weather, which leads to fermentation. Overripe fruit should never be used in catsup, any more than in jelly or preserve.

Farm Home in Massachusetts

Those of our readers who have ever been in rural New England will quickly recognize the type of farmhouse shown at Fig. 271. It was in just such houses that the best blood of Yankee land was born and reared. There is something about the whole place that advertises the solid character of the New Englander of the past generation. The comfortable house, without trimmings or adornment, was built by sober men and women who held strong and severe ideas of duty toward family and country. Usually the timbers in these old houses are too good to come down, so the boys and girls (or some "city farmer") will tack on "bow windows" and other frills as more in keeping with our modern age. There was usually a long shed running from house to barn so that the farmer could go out and look at the "creatures" in the tie-up without facing the storm. They were mindful of comfort when these houses were built, and there was a Winter's supply of dry wood in the shed. In many of the big barn doors two other doors were cut—one swung open for the men folks and the other at the bottom for the cat. It was a serious matter to pass the husk mats at the back door without leaving on their rough coats the dirt which might otherwise be tracked upon the kitchen floor. The big stone wall was another feature of the New England front yard. When Father and the boys could find nothing else to do they picked up big stones—thus entailing a job on the present generation. The old men called it "good for sore eyes" to see their fields cleared, but now their great stone piles are truly eyesores to those who follow them, and these monuments to labor are put underground or broken up to provide road metal. In Massachusetts, where this old house is located, the electric railroads are stretching out over the old country highways, and changing the whole aspect of affairs. As the cars go whirling over the country they sow the seeds of a new order of things. It is like tearing away the curtain which kept the old time life and habits apart from the busy town. The houses are painted and made over, the stone walls disappear, flowers spring up in the yard, and slowly but surely the old type of the New England home is passing away. The changes are on the outside, however, for the family feeling, the thrift and loyalty are still there. There is not enough electricity in a trolley wire to change that. The home figured in the picture has now descended to two women, who aim to farm on modern lines, while preserving their loyalty to the older traditions of the good Bay State.

A WOMEN'S FARMHOUSE IN MASSACHUSETTS. FIG. 271.

Household Notes.

What experienced housekeeper has not been disturbed by seeing a careless person scrub a floor, using the first broom at hand, which was generally the newest one, and jamming the broom into a pail not half large enough to admit it without doing serious damage? This operation is continued to the end of the job, and nearly to the finishing of the broom.

In warming up potatoes, a favorite dish this time of the year, after they are sliced into the spider and seasoned, a convenient and expeditious way is to use a baking powder can to chop them up. It will do much more execution than a knife in the same time.

Sometimes when making a batch of cookies or doughnuts, by mistake they are made too rich, so that when put into the hot lard to fry they absorb too much grease and prove to be a failure. If the dough is laid aside in a cold place until the next day the trouble will be done away with.

I have often noticed a little act of thoughtlessness which ought not to occur; in a church or hall, when many people are gathering in the usher brings perhaps one person to an empty pew, and that person sits down in the place nearest the entrance, and others who come later must crowd past her, or perhaps she will move enough to accommodate that one, and so on, when if the first one would take the farther end of the seat more people could be comfortably seated. A little thought for the convenience of others would seem desirable.

An enthusiastic sweeper will often seize a broom and bring it down with a circular motion, sending all the available dust into the air to choke all present and then settle back on the furniture, making extra needless work.

Here is a recipe for Henrietta's bread pudding: One pint bread crumbs, one pint milk with tablespoonful of butter and pinch of cinnamon; three spoonfuls sugar. Heat up and pour hot over the bread crumbs. When cool enough stir in one egg, yolk and white beaten separately, and bake 20 or 30 minutes. Raisins or other fruit to your taste.

AUNT RACHEL.

Preparing Grape Juice.

The recipe for canning grape juice in a late R. N.-Y., though it gives the pure unwatered juice, would, I fear, deter the ordinary housewife, who probably has no cider or jelly press, as it seemed a little difficult. We use a good many gallons every Summer put up easily this way: Cover the grapes with water, mashing as they come to a boil, press out the juice, add one-third cupful of sugar to a quart, let it just boil up, and can or bottle. If bottled be sure to soak the corks an hour at least before putting in, so that they will shrink in. When cold dip in melted beeswax all over the cork. When using add one-third to one-half cold water; sugar if you wish it sweeter, and ice. E. C. G.

IF thou workest at that which is before thee—following right reason seriously, vigorously, calmly, without allowing anything else to distract thee, but keeping thy divine part pure as if thou wert bound to give it back immediately—if thou holdest to this, expecting nothing, fearing nothing, but satisfied with thy present activity according to nature and with heroic truth in every word and sound which thou utterest, thou wilt live happy. And there is no man who is able to prevent this.—Marcus Aurelius.

A Day With the Babies.

Where the narrow strip of Jersey shore rises abruptly to the Palisades, with the white dome of Grant's tomb gleaming directly across the Hudson, a small vine-covered cottage attracts the passer-by. It is not the gay window boxes, the smooth green lawn, sloping up towards the rocky bluffs, or the abundant shade that causes one to linger near, but the avalanche of babies, overflowing from the cottage to the lawn, the roadway, and even to the river's edge. It is not a kindergarten or an orphan asylum, as a first glance might suggest, but a fresh-air day nursery, where poor mothers may take enfeebled infants and children from the crowded city for a breath of wholesome country freshness. It is doing practically the same work as the Floating Hospital, described in THE R. N.-Y. two or three years ago, only, instead of a day on salt water, the Edgewater Créche provides the pleasures of the country.

It is 16 years since the Créche began its work. A good woman started its career with Mason Cottage, a pretty little shingled building like a Swiss chalet; an open-air pavilion was added and a bath house is now in course of construction. A bathing pool has been enclosed between two jutting piers, within stone's throw of the front door, and it is a joyous sight to see the children in various stages of undress, paddling or splashing in the river. The guests of the Créche receive tickets entitling them to its privileges, and providing them with transportation across the river, from various churches, societies and nurses' associations in New York. Last year between June 15 and September 15, 10,192 guests were received. The Créche is entirely dependent upon voluntary contributions, and makes no distinctions of race, color or creed. In addition to the matron, a trained nurse is in attendance, and it receives a daily visit from a woman physician.

From the reception room, furnished in a cool harmony of blue and white, we go upstairs to a dormitory, with rows of little white cots for sleeping babies.

"Do your guests ever stay over night?" we asked.

"Sometimes," said the matron. "We may decide that a sick child would be greatly benefited by staying, or our nurse may wish to arrange for its care. We have a bed here for the mother, too."

Looking at both mothers and babies, we were struck by their neat appearance. Many looked ailing, with the bleached tenement-house complexion we grow familiar with in the city, but there was no appearance of squalor. Mentioning this to the matron she said:

"You can't judge poor people by outward appearances. They wear their best clothes when they come here, and their self-respect prevents them from making any parade of their circumstances. There may be real want among those you see now."

The number of visitors goes as high as 375 in a single day. The collection of babies at the time of our visit was a very variegated one. There was one family of five Japanese, ranging in age from about 10 years to as many months, and these little slant-eyed subjects of the Mikado pranced about the lawn and took flying jumps off the terrace with as much exuberance as the native born. One solemn baby sat alone in the middle of the crowded lawn, apparently feeling that this was no occasion for levity; his attention was equally divided between a pair of sky-blue stockings and the wandering shadows from the branches over his head, which were evidently a new experience. Brick-and-mortar babies know little enough of the things that grow; some of the tired women who visit the Créche and view the growth about the Palisades say that they never before knew so many trees and flowers grew in America!

The bath house now being built is a memorial gift; it contains 15 baths for babies, and three for adults, but the river pool is the great attraction to the children old enough to enjoy it. It is pleasant, too, to see the bland satisfaction with which the juveniles imbibe milk, a little-known fluid with many of them. To the average tenement dweller, milk is a luxury, and not a food. One mother who had commented on the good temper of her baby while at the Créche, was asked whether she gave him milk

3805 House Gown, 32 to 42 in. bust.

at home. "No, indeed," she answered with surprise. "He gets his coffee, like the rest of us. Milk costs too much; beside, it's too much trouble."

The white-capped nurse and white-aproned matron, little women both, with a big responsibility resting upon them, can tell many a tale of the silent heroism, the suffering, and the mutual and brotherly charity of the poor. Some of the saddest sights we see from the tall windows of THE R. N.-Y. office, are the frequent babies' funerals from the nearby tenements—sometimes with the senseless parade of hearse, procession and brass band—sometimes a pathetic little coffin carried into a shabby hack. The poor city baby must have a strong grasp on life to keep his hold on it at all, and this present Summer has been harder than usual to endure. Such institutions as the Edgewater Créche, St. John's Guild, and the various fresh-air associations mean life to many a child, and even those who doubt the usefulness of many so-called charities must be in sincere sympathy with their work.

The Rural Patterns.

The house gown or wrapper shown has the yoke faced on to the lining, but both the gathered fronts and the pleated back are separate and are arranged over it. The neck is finished with a regulation stock, and shaped bretelles fall over the shoulders and make a most effective trimming. The sleeves are in bishop style with pointed bands at the wrists. The original is held at the waist by ribbon velvet, but when desired the gown can be allowed to fall free from the yoke. To cut this gown for a woman of medium size 12 yards of material 21 inches wide, 11 yards 27 inches wide, 10¼ yards 32 inches wide, or 6½ yards 44 inches wide will be required, with one yard of plain silk for tucking or ⅝ yard of tucked material for yoke and collar. The pattern No. 3805 is cut in sizes for a 32, 34, 36, 38, 40 and 42-inch bust measure; price 10 cents.

The breakfast jacket illustrated is suited to dimity, batiste, lawn and the like, and to such light-weight wools as cashmere and albatross, but in the original is made of white lawn with frills and bands of needlework. The fronts are tucked to yoke depth, then allowed to fall free and form folds, but the back is laid in pleats that are stitched in tucks and produce a tapering effect. At the neck is a sailor collar and the sleeves, as shown, are tucked and in elbow length, but the pattern also includes those of full length that are cut in slight bell shape. To cut this jacket for a woman of medium size, four yards of material 27 or 32 inches wide, or 2½ yards 44 inches wide will be required, with 4½ yards of embroidered bands and seven yards of edging to trim as illustrated. The pattern No. 3892 is cut in sizes for a 32, 34, 36, 38 and 40-inch bust measure; price 10 cents.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

Rural Recipes.

Peach Roll.—Cream together half a cupful of butter and a cupful of sugar, add two well-beaten eggs, also half a pint of rich milk. Mix well, then sift in flour enough to make a soft dough. Divide the dough in three, roll out each piece in a long oval, and cover the upper sides of the dough sheets with ripe peaches, peeled and sliced thin. Roll up the sheets, pinch the ends, and lay them in a baking pan side by side, then set them in a brisk oven. Serve with a very rich sweet sauce, flavored with the peach kernels, blanched and shredded fine. To make this sauce, cream a cupful of butter, mix it well with two cups of sugar, beat very light, then set over hot water, beat in the juice of a lemon. Add the shredded kernels, and stir hard. Keep the water around the sauce boiling until ready to serve. Cut the roll in thin slices, put three on each plate, and deluge them with the sauce.

Preserved Melon.—Muskmelons, or cantaloupes, that are underripe, and the rind of watermelons, may be preserved in this manner: Make a syrup of sugar and water, one pound of sugar to a quart of water; when the syrup is boiling, drop in the melon and allow it to stand until the next day; then pour off the syrup; let it heat to boiling point and pour over the melon slices and let stand until cold. Repeat this for three days. After boiling up the syrup the last time and before pouring it over

3892 Breakfast Jacket, 32 to 40 Bust.

the fruit, flavor delicately with vanilla extract.

Spiced Melon.—Select melons not quite ripe or take the rind of watermelons, slice, pare and cut into strips or blocks. Steep these for 24 hours in cold water and vinegar; have water enough to cover and add enough vinegar to make the water tart, but not very acid. Then drain them and put them into a cold syrup made of sugar and water boiled together. Bring slowly to boiling; then let get cold; then drain off the syrup; add to it a few sticks of cinnamon, a few cloves and little ginger root; boil up and pour over the melon slices; repeat for three days; then seal up in jars. Another way is to take five pounds of the fruit, cut into blocks; put into a stone jar. Boil three pounds of sugar with one quart of vinegar and pour over the fruit. Continue to do this for eight days. The following day pour off the syrup, add to it half an ounce of whole cloves and one ounce of stick cinnamon; boil together for a few minutes; then add the melon and simmer gently for half an hour. Seal in jars and do not open for two or three months.

Cucumber Catsup.—Pare large, ripe cucumbers, remove the seeds; grate fine and measure. Place the pulp in a colander and drain well. To every quart of the pulp allow a half-teaspoonful of cayenne pepper, one teaspoonful of salt, two tablespoonfuls of grated horse-radish, and a pint of good cider vinegar. Mix together thoroughly, do not cook; bottle and seal. This is very nice to serve with fish.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

One word—

MACBETH—stands

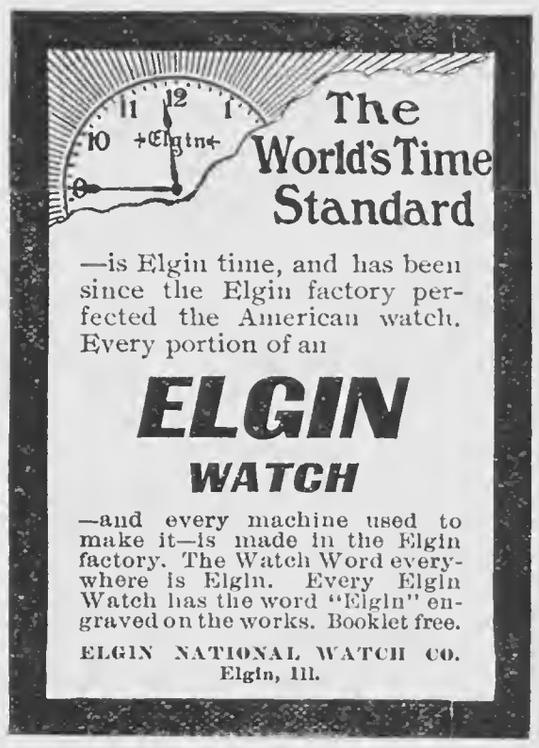
for everything good

in lamp chimneys.

My name on every one.

If you'll send your address, I'll send you the Index to Lamps and their Chimneys, to tell you what number to get for your lamp.

MACBETH, Pittsburgh.



Dietz JUNIOR Dash Lamp

Cold Blast. For Kerosene.

This is a neat, moderate sized tubular lantern with strong reflector, attachable to any vehicle, and gives an extra good light that will not blow out in any wind. It is but 12 in. high; weighs only 26 oz.; burns 13 hours. Can be used as hand, wall or dash lamp. Attachment for dash accompanies each. There is no removing of the globe in filling, lighting or regulating. It is easily kept clean and absolutely safe.

If not at your dealers, send us $1.25 and we will send you one all charges prepaid, safe delivery guaranteed.

Before you buy anything in Lamps or Lanterns obtain our large illustrated catalogue, sent free on request.

R. E. Dietz Company, 87 Laight St., New York City. Established 1840.

BUSINESS BITS.

WHEAT-sowing time is near at hand, and those desiring change of seed will do well to look into the value of Turkish Red, offered by J. R. Ratekin & Son, Shenandoah, Iowa. It has the endorsement of every experiment station where tested, and it has a record of 55 bushels per acre at the Iowa Station, with an average yield of 45 bushels.

IT is seldom that such an opportunity is offered to buy an ideal fruit and dairy farm as that of T. G. Yeomans & Sons, Walworth, N. Y., in this issue. It is unusual to find the conditions desirable for both fruit and stock on the same farm, but this one seems to combine them to the fullest extent. Anyone interested will do well to write for prices and particulars.

EVERY year the farmer recognizes more and more the value of corn crop for fodder. If the crop is not put in a silo, the stalks are either cut or shredded as the next best means of preparing them for cow food. One of the very best cutters for either silage or dry fodder cutting is made by the Belcher & Taylor A. T. Co., Box 76, Chicopee Falls, Mass. Write for full particulars, prices, etc.

G. G. BROWN, of Bristol, N. H., writes that he has used Tuttle's Elixir in the different diseases in horses, and considers it the best horse medicine in the market. He has never failed of obtaining good results in every case he has used it. Every man owning a horse should have a bottle of it in his stable. Write to Dr. S. A. Tuttle, 30 Beverly St., Boston, Mass., for his book, "Veterinary Experience," which he will send absolutely free. Dr. Tuttle is Boston's most prominent veterinarian, and his experience is valuable to every horse owner.

THERE is no farm implement of recent invention which contributes more to the comfort and convenience of the farmer than the blower attachments for fodder and silage cutters, a pipe attachment designed to carry the cut fodder to any desired place. The continual annoyance from breakage and slipping of belts from the old-fashioned long carriers has been overcome by this device. The blower manufactured by the Belle City Manufacturing Co. is especially popular for its simplicity and the ease with which it may be adjusted to old or new machines. Write the Belle City Manufacturing Co., Racine, Wis., and get their latest printed matter on this line of machinery.

The paroxysms of Whooping Cough are at once relieved by Dr. D. Jayne's Expectorant, and if this medicine is continued, it almost invariably effects a cure.—*Adv.*

We bought them at a forced sale and until all are gone we will sell them at $9.75. Order today, don't delay. You never will have another such opportunity. Address, **SEARS, ROEBUCK & CO.,** CHICAGO, ILL.

The Yeomans Fruit Farm For Sale

To close the Estate of the late T. G. YEOMANS, and because of the poor health of one of the survivors.

A **Rare Chance** to **Purchase** one of the **Choicest Fruit Plantations** of the State at a **Very Low Price.** It is beautifully located, in and surrounding the village of Walworth, Wayne Co., N. Y. Embraces 135 acres of mature apple orchards, 20 acres of pears, quinces, peaches and cherries, and 200 acres of choice farm lands, all in a high state of fertility.

Orchards in perfect condition, and of most desirable market varieties. **Apples are largely Baldwins.**

Can be Divided if Desired.

Prof. L. H. BAILEY says: "I have always considered the Establishment of T. G. YEOMANS & SONS, at Walworth, N. Y., to be one of the best general farm properties I have ever seen. It appeals to me as quite the ideal Fruit and Dairy Farm, and these two things do not often go together."

A CHANCE in a THOUSAND for the RIGHT MAN.

T. G. YEOMANS & SONS, WALWORTH, N. Y.

BOOK BULLETIN

FOR SALE BY THE RURAL NEW-YORKER

SOILING, ENSILAGE AND STABLE CONSTRUCTION, by F. S. Peer. Full details of the best methods of growing and feeding soiling crops. Valuable suggestions for barn building. Price, postpaid, $1.

ECONOMIC ENTOMOLOGY, by Prof. John B. Smith. The best moderate-priced work on bugs and worms that we know of; 481 pages, with excellent illustrations and descriptions of the various insects which the farmer and fruit grower meet, and the best methods of handling them. Not only an instructive but a well-written and interesting book. Price, postpaid, $2.50.

CUT-PRICE BOOKS.—Any of these 20-cent pamphlets sent postpaid for 10 cents:

How to Plant a Place.
Memory Training.
Country Roads.
My Handkerchief Garden.
Fruit Packages.
Fertilizers and Fruits.
Fertilizer Farming.
Chemicals and Clover.

THE RURAL NEW-YORKER,
New York.

MARKET NOTES

FRUIT SPECULATION.—One reader wishes to know whether he can safely pay $1.50 per barrel for apples and pears for shipment to commission dealers in New York. It is not possible to give a definite answer to this, as so much depends upon the quality of the apples and pears. At the present prices for apples anything of reasonably good quality ought to be a safe investment at this figure, but it certainly would not do to buy pears at this price for reshipment at present, unless they were extra. Just now pears are selling slowly. A fruit dealer told me that not long ago he sold a small lot of choice pears at $2.40 per keg. The returns for this lot seemed to make the shipper crazy, and he immediately wrote that he would send on 40 kegs more. The dealer tried to stop him, stating that the pear market was down, but he insisted on shipping them, "and there they are," said the dealer. "I haven't had a decent offer for them yet." The best way for a man who wishes to do business in buying and shipping fruits is to make connection with a thoroughly reliable handler in the market; then keep in close touch with him and follow his directions. He may make a mistake now and then, but he certainly knows more about the demands of his trade than an outsider. Speculation is at best uncertain business, and but few have the ability to carry it on for any great length of time without learning what the word loss means most emphatically.

PACKAGES.—The terms basket, box, carrier, bag, etc., used in market quotations of fruits and vegetables are rather indefinite to an outsider, and we have several requests for explanations of the capacity of these packages. Many of the city dealers and buyers neither know nor care how many quarts a certain box or crate contains, as the stuff is bought and sold by the package rather than the quart or bushel. The life of the produce commission merchant is at times an exceedingly busy one. He is at it long before sunrise, and every day has a lot of tough problems to handle. He must wrestle with the keenest buyers and do the best he can for his shippers, or he will soon lose their trade. It is no wonder that he does not bother with matters that are of no account to him. The packages described below are some of the standard sizes regularly seen in this market, but it must be remembered that there are always odd-sized boxes, baskets and crates on hand that are of no particular size. The slatted tomato and cucumber box is nearly square and holds a bushel. The common melon crate has about the same capacity, but is of different shape, being longer. The peach carrier contains six oblong baskets, holding a little over three quarts each. This is a most desirable package for shipping peaches from a distance. They load to advantage in the car and the fruit does not get bruised to any great extent. No doubt it will in time largely take the place of the old-fashioned peach basket for the better grades. The well-known form of peach basket, the inverted bell, contains 16 quarts. At present a large quantity of peaches from Jersey and other nearby points are seen here in these baskets. They make a good display in the store, as the top being larger than the bottom the fruit is more conspicuous than the package. Another popular basket of this same form holds about one-third of a barrel, and is used for melons, string beans and other vegetables. Bushel bags are used to some extent for green Lima beans, and a good many tomatoes are seen in ordinary, handled bushel baskets, such as are used about the farm. The various grape packages will be described later. W. W. H.

CONNECTICUT FRUIT GROWERS MEET

A field meeting of the Connecticut Pomological Society was held August 22 at the farm of the Connecticut Valley Orchard Co., half way between Berlin and Meriden. Arrangements had been made with the railway people to let off passengers at the orchard, and there were about 200 in attendance. J. T. Molumphy, manager of this fruit company, piloted the visitors about the orchards, where they had an opportunity to see the methods employed and sample the varieties then ripening. This trip around the farm was followed by a substantial New England picnic dinner in a grove near the house; and the afternoon was given to addresses and the discussion of various questions connected with fruit growing. President Platt called for Mr. Molumphy, who, in reply to questions about the fruit industry at this farm, said that they have about 240 acres in orchards, three-fourths being peaches. The yield of peaches this year will be not far from 25,000 baskets. Favorable conditions in early September might increase this to 30,000. The wet weather and lack of sunshine have been unfavorable for the fruit, and increased the tendency to rot. Elberta is the chief market variety. Other sorts raised are Stump, Thurber, Mountain Rose, Oldmixon, Crosby, Waddell, Carman and Tillotson. In apples Baldwin is the principal variety, and will be about one-fifth crop. Fallawater and Ben Davis are well loaded, but these are not grown to any great extent. In Japan plums Burbank and Abundance are the leading varieties, with a few Ogon, Red June, Hale, Wickson and Chabot, all bearing well this year. There is also a plantation of Bartlett and Kieffer pears, and a vineyard of Worden, Concord and Niagara grapes.

Mr. Merriman, ex-president of the Society, who has been spending some time at the Pan-American Exposition, urged the members to brace up the State fruit exhibit there by sending fine specimens of varieties now ripening. Connecticut having an enormous crop of peaches this year, has an unusual opportunity for making an attractive display. To pack for exhibition purposes he recommended taking a strong basket, putting excelsior in the bottom, wrapping every peach in paper and packing tightly with excelsior on top. He spoke of the amusement and interest shown in the Connecticut exhibition of wooden nutmegs, which can be made from any kind of wood and can't be told from the genuine. Following are parts of J. H. Hale's address:

"For a number of years people in this State have been planting trees and trees and more trees, until this year they have run up against the proposition of handling a big crop, many being unprepared for it. A few years ago I sold a man a few hundred Japan plum trees. I had forgotten all about it until one day he sent me word to come down quickly if I wanted to see some plums. I went there, and found that he had at least 200 bushels that should be picked in a week. How do you think he was trying to dispose of them? He was carting them to a town some distance away and peddling them out in small lots. In that way he could have handled but a small fraction before they spoiled, but it took considerable urging to stir him up to the necessity of hustling around and getting an outside market instead of peddling them out by the quart. Our local markets can't begin to handle our peaches and plums this year. We must go outside, and my opinion is that at present New York offers the best inducements. Boston, while usually a superior market, has not panned out well this season. From the reports in reply to inquiries made of members of this Society, I find that within 12 miles of Hartford there are at least 200,000 baskets of peaches to ripen in five weeks. At its best Hartford cannot consume more than 1,200 baskets a day, or 40,000 for the next five weeks, leaving this remainder that must be shipped away. It is a good thing for the consumers this year, for they can fairly wallow in peaches. What is true of the section mentioned, in a measure applies to Wallingford, New Britain and Middletown. Also, the railroads have not made any special preparation for handling this fruit, largely because they did not know definitely about the size of the crop, and farmers have not put any pressure on them for cars. The southern roads and the northern connecting ones send their agents through the South weeks in advance of marketing, that they may know how much transportation to prepare for. These crop statistics that we have been gathering will be circulated, and it is hoped will prove a material help to our fruit growers in attracting buyers from outside, who otherwise might not know the extent of the crop and the heaviest fruiting sections."

Other speakers were J. W. Clark, of North Hadley, Mass., and Dr. Russell, of Hartford. This Society is neither dead nor dreaming. In addition to the social pleasures of such a meeting, the members have learned the advantage to be gained by taking now and then a day off to exchange ideas and experiences, and go about actually to see what others are doing and how they do it. When a yellow jacket goes for some one who disturbs his nest, he has a definite object in view, which he immediately makes known to the trespasser, and continues to make it known until he is killed or driven away. The same persistence in fruit growing; the sandwiching together of science, sense and work, and the application of this combination to a definite object, is sure to work out something worth showing and talking about. The fourth annual fruit exhibition of this Society will be held at New Britain, Conn., October 1-2.

PAN-AMERICAN EXPOSITION NOTES.

State Agricultural Exhibits.

CONNECTICUT.—The whole design of the Connecticut exhibit is good. Native Red cedar posts and railing have been used, which give the display a very rustic appearance, and added to this are some very nice decorations made of grains in the straw and forage plants. The exhibit of cereals is very good considering the natural conditions of the State. Corn is displayed in large variety, especially the sweet corns, of which latter there is a great quantity grown for seed, because the conditions there seem to enable the farmers to grow the very best quality. The display of varieties of popcorn is also very fine. There is little wheat grown, and the showing of that grain is very small; but rye, oats and buckwheat are grown very extensively, especially for home consumption. There is also an extensive display of vegetable seeds, the growing of which is the chief business of a number of the farmers. Connecticut tobacco is known all over the country, and the line of samples shown are of the best grades. One particular feature of the tobacco exhibit is a line of samples of the Sumatra, which was grown under sheds covered with cheesecloth. These are said to rank in quality with the best tobacco grown on the Island of Sumatra itself. Connecticut having been called the "Wooden Nutmeg State," those in charge of the exhibit here thought it proper to show some of their wooden nutmegs, of which there is quite a nice display. It is said that some one was once twitting Prof. W. H. Brewer with the fact that his State was such a small one, and had been engaged in the manufacture and sale of wooden nutmegs, and his reply was: "Bring me a grater." A large collection of hickory-nuts is shown, in which there are 18 choice varieties. This is one of the small but very profitable cash products of the State. There are also Persian walnuts shown, which proves that all varieties of this nut are not too tender there. There is also a beautiful exhibit of the oyster industry, showing how the bivalves are propagated, and their different stages of growth and the market grades. A very conspicuous motto is displayed which says: "Connecticut, small but mighty, situated in the heart of the best market region of the country."

MASSACHUSETTS.—In great contrast with nearly all the other States is the display made by Massachusetts. It is, perhaps, the least attractive of all, and this is indeed a very sad fault, for at an exposition where people go, perhaps primarily to be instructed, they must first be entertained. The exhibit is severely plain and formal, there not being a single agricultural product of any kind shown. There is a series of charts, diagrams and maps which would explain to the student what the agricultural resources of the State were and the products of the rural industries and other such things, but to the ordinary visitor I believe they are exceedingly dull and uninteresting. Neither is there an attendant in charge to explain matters, so far as I have seen in the halls which I have made there. However, there is a beautiful exhibit of photographs of the native trees of the State accompanied by small specimens of the wood of each, showing the grain in both cross and vertical sections. These were made by an eminent workman in this art, Romeyn B. Hough, of New York State, and are excellent. Of course, their proper place would have been in the Forestry Building.

GEORGIA.—This State has a small but very nice exhibit. The cereals and seeds are shown in jars, and there is a nice display of grains in the sheaf, which shows that the State of Georgia is able to grow products of this sort that are of good quality. There is also a very excellent display of forage crops of various kinds in bales ready for market. One of the handsomest bales of cotton to be found in the building is on the Georgia space. It is to be regretted that there is no attendant in charge of the exhibit to explain the things that are so well shown there.

H. E. VAN DEMAN.

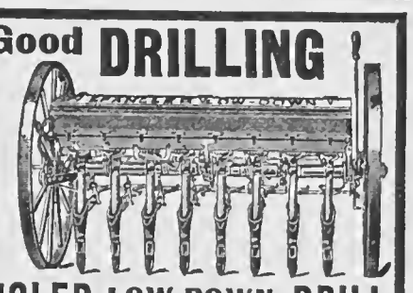
He Can't Believe It.

He's blowing with all his might and can barely stir the recording hand from zero. There's many a big, healthy looking man who is weak in the lungs. Probably half or two-thirds of his lung surface barely knows the contact of oxygen. He's the kind of man, who, when a cough attacks him, goes galloping down the road toward consumption. Many such a man has found strength and healing for weak lungs and tissues lacerated by coughing and drained by hemorrhages, in the use of Dr. Pierce's Golden Medical Discovery. The healing power of this medicine in pulmonary diseases seems little short of marvelous at times, so extreme are the conditions which it cures. The "Discovery" contains no alcohol, and no narcotics.

"When I started to take your 'Golden Medical Discovery,'" writes Mr. A. F. Novotny, of New York, N. Y., Box 1437. "I had a regular consumptive cough, of which I was afraid, and everybody cautioned me and warned me concerning it. I was losing weight rapidly, was very pale and had no appetite, whatever. Now my condition is changed entirely. I do not cough at all, have gained eight pounds in weight, have recovered my healthy color, and my appetite is enormous. I can recommend your medicine to everybody who may be in need of the same, as it is a sure cure."

Dr. Pierce's Pellets cure constipation.

For Good DRILLING
—so that grain will come up quickly, stool out well and make a full crop, nothing equals this



SPANGLER LOW-DOWN Grain and Fertilizer **DRILL**

Low and easy to fill; light draft, force feed all over; feeds fertilizer 60 to 700 lbs per acre, lumpy, damp or dry; grain, fertilizer, grass seed and land measures all tested and correct. Hoes easy to raise. Zig-zag and lifting levers. All feeds thrown out of gear at once by lifting hoes. Pin or spring hoes. Warranted in all ways. Write for free catalogue.
THE SPANGLER MANFG. CO., 505 QUEEN ST., YORK, PA.

IT TAKES TWO PAILS

to hold the milk of one cow when she is properly fed. Correct dairy feeding means the use of ground feed exclusively in the grain ration. Experienced men will tell you

The Scientific Grinders

grind ear corn and other grains faster and more cheaply than it can be done in any other way. We make numerous grinders, sweep and power. Don't buy until you see our catalog R Mailed free.
THE FOOS MANUFACTURING CO., Springfield, O.

The Cost of Feed

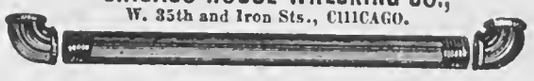
may be greatly reduced by doing your own grinding, especially if you use a

STAR FEED GRINDER.

(The mill with the short sweep). It never chokes. Grinds ear corn, dry, damp or frozen. Grinds all kinds of grain, singly or mixed. We make power mills too. Circulars free.
STAR MANFG. CO., 13 Depot St., New Lexington, Ohio.

WROUGHT IRON PIPE

Good condition, used short time only; new threads and couplings; for Steam, Gas or Water; sizes from ¼ to 12 inch diameter. Our price per foot on ¾ inch is 3c; on 1 inch 3½c. Write for free catalogue No. 57
CHICAGO HOUSE WRECKING CO.,
W. 35th and Iron Sts., CHICAGO.



WELL DRILLING Machines

Over 70 sizes and styles, for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.
WILLIAMS BROS., Ithaca, N. Y.

Live Stock and Dairy

DAIRY AND FARM NOTES.

Discussion of a Balanced Ration.

I wish to get a fairly good ration for cows without purchasing much hay. I have prospects of plenty of corn and fodder corn, mangels, parsnips and sugar beets. Advise how you would feed same to make a balance, and what is best to add to it?
New York. H. B.

Assuming, of course, that these cows are in a good flow, and are of good milking stock (and by that I mean cows that are making 250 or more pounds of butter, or its equivalent in milk or cheese) to analyse the foods at hand we find first the corn and corn fodder. If this corn fodder is fed whole to the cows a somewhat different resultant ration will follow. I think this fact is not always recognized in ration making, when so-called corn fodder is fed whole. Every feeder knows that the leaves and upper portion are consumed without much waste, while the butt end of the stalk is found rejected. The leaves contain a greater proportion of protein, and the butts a greater proportion of carbonaceous matter. The animal will always make an effort to balance the ration to her individual wants. To illustrate: If the protein foods, such as cotton-seed, gluten, brewers' grains or bran are fed with corn fodder, the animal will labor almost unceasingly to eat the whole stalk in her effort to get enough heat and energy-producing food. I have seen our cows eat well-ripened wheat straw with as much relish as they did clover hay or good silage when giving a full flow of milk, and not reduce the flow, and at times increase it somewhat. This idea seems quite strange, but it simply shows the necessity of a certain amount of coarse dry fibrous matter, especially when the ration is deficient in sugars and starches.

The reader will readily see that with a surplus of corn fodder for coarse food more of it will be consumed if the purchased food is gluten, cotton seed, or brewers' grains (dried) fed in connection with one-third wheat bran or oats ground. I would not be so particular which of the foods was used. The cost of a pound of protein would govern. For two years gluten feed containing 27 per cent protein, and purchasable at $18 to $21 per ton, has been a cheap protein food. As I write I am not posted on prices. We bought a part of a carload of gluten before the sharp rise in corn, at $21, which I considered reasonable.

The mangels and sugar beets are quite well balanced. That is, a ration will not be materially changed in its ratio of protein to carbonaceous matter by the addition of either of these roots. But of course dry matter will not be increased very rapidly by their addition; 100 pounds would not give the cow over 10 pounds; a trifle more in the sugar beets, but not in the mangels. With the foods mentioned they will have a double function, viz., as a food and as a digestive agent. There is no mistaking it as a fact that succulence has a cash value. It is rather my judgment that most farmers are better fitted to grow corn silage as food and succulence combined, than to grow roots, and we have quite abandoned root growing since feeding silage. But in institute work it is no uncommon thing to find very substantial and reliable farmers feeding both with profit, and this idea again brings up a very important question in animal feeding, palatability. The questioner usually asks how to balance, but the cow, like the human, says: "I like it" or "I don't like it"; that settles the question with mankind; and so it does with stock so far as profit is concerned. If roots are added we have also variety as well as palatability, and cows do certainly like a variety of food when kept in the barn. We think sometimes that when at pasture they get only one kind of food. Not so; they are eating by far a greater variety than any feeder will furnish, not only of grasses but weeds and herbs that furnish medicinal properties as well as food.

It is this variety, with the above-mentioned reasons, why the animal will do so much better as a rule on pasture, with less bowel trouble, in fact, less trouble all the way through, and I am not sure but a run of the rougher lands on this account alone may be profitable where soiling is practical. It is the lack of these medicinal properties that has called for the patent stock foods on the market, which are sold at such extravagant prices. Practically all the food value they contain is found in their 90 per cent oil meal. A very good substitute for these foods can be made of 100 pounds oil meal, five pounds powdered charcoal, four pounds gentian, five pounds salt, three pounds fenugreek, three pounds saltpeter, five pounds Epsom salts and three pounds allspice. This mixture will cost $5, or about four cents a pound, and my experience in feeding would warrant the statement that it is just as good as the high-priced stock foods. A little ginger may be added, and for Winter use increase its value. The charcoal is an absorbent; the gentian a fine tonic, fenugreek a flavoring, saltpeter a diuretic, Epsom salts a mild cathartic, and the allspice —well, I don't know myself. A little mystery is always valuable in anything we purchase. Prof. Voorhees says that "The fertilizer manufacturers mixed in a bit of mystery and got $5 a ton for it," so in this combination we put in the allspice.

To summarize, I should feed a half bushel of roots per cow, beginning with one-quarter that amount; a grain ration made up of at least one-third bran, or oats two-thirds, and in weight from five to 10 pounds, depending upon period of lactation and age and size of animal, and all the corn fodder the animals would eat and relish. If the cows were not holding enough flesh for health I would displace the grain ration above-mentioned with enough cornmeal to accomplish the desired result. I am unable to give any information in regard to parsnips. H. E. COOK.

THE MERITS OF LINCOLN SHEEP.

The Lincolns were originally large and ungainly sheep. They were bred from time immemorial, on the low marsh lands of Lincolnshire, England, a great deal of this land having been reclaimed from the sea. Englishmen claim that Lincolns were crossed with the improved Bakewell Leicesters, which has greatly changed the character of them, and they are now ranked as one of the most useful breeds of the British Isles. In form they are larger than the Leicesters or Cotswolds; they are indeed the heaviest of all breeds, and if possible shorter in the neck. Their fleece is heavier, longer, and much finer. Their wool is, in fact, the longest of all the British breeds, often reaching 20 inches in length, and is usually massed in flakes or strands, moreover it is further distinguished by a peculiar brightness or luster which adds much to its value, no other wool having such brightness. It is said that it can be used for more purposes than any other wool raised in England.

The principal buyers in the Lincoln markets are men from South America, South Africa, New Zealand and Australia, all these countries having a very dry atmosphere. The sheep certainly have adapted themselves to all countries they have been introduced into. They will thrive in the torrid zone as well as in the frigid. They are also becoming popular among the ranchmen of America to cross upon the range sheep to get wool and mutton. For a mutton sheep as compared with the other long-wooled breeds they are equalled by few and surpassed by none. They have a strong constitution, and live to a good old age. While I exhibited at a western fair several years ago a Boston wool buyer asked leave to get into my pens and examine the wool. He gave it a thorough inspection. When he got through I asked him what he thought of the wool. He said that it had more life in it than any wool on the fair ground, and he also said that the American people made a great mistake in crossing the American sheep, which he said was largely Merino, so much with the Down families. Then he gave his reasons for what he said. It does not increase the quantity, quality or length of fiber, but rather deteriorates it, more especially when crossed with the Shropshire, which he said was a poor wool at the best, and after the sheep got old it was very little better than shoddy. One reason why the South American people value the Lincolns so highly is for their superiority in crossing with the range sheep of that country. With care, attention and good management, they will do well almost anywhere. It is said that all sheep are a good deal what you make them, and to attain the best results they want good care. How do they compare with other long-wooled sheep? I have perhaps answered this question, but will try to answer it more exactly. One superiority over the Cotswold is that their wool has more life in not being so dry and harsh; as compared with the Leicesters they will shear more wool, it being covered more evenly over the body and down on the legs. I have tried to keep within bounds, and would not like to write anything that would mislead or deceive the people.
Marlette, Mich. ROBERT KNIGHT.

KILLED-DEAD.

You know that the horse buyer knocks off $50 or more for every lump or blemish on a horse. Get full value for your horse—don't have any lumps. Cure him with

Tuttle's Elixir.

It is guaranteed under a forfeit of $100. to cure any case of *horse ail, curb, splints, contracted cord, callouses, thrush, etc.*

A SIMPLE STORY OF CREAM.

BUILDING UP A NEW BUSINESS.

A Suggestion for Farm Neighborhoods.

Four or five years ago, being engaged chiefly in the sheep business, and having but few cows, our dairy products were taken at the door by a peddler who furnished customers in the city of Waterbury, Conn., about 15 miles distant. Owing to the failure of his health, however, we were left without a market for even the small amount thus produced, so we concluded to take the route he was obliged to give up. This route was small, less than 40 pounds per week, and considering the distance traveled—once a week in Summer and once in two weeks in Winter—was not a very profitable enterprise at the prices received, 25 cents in Summer and 30 cents in Winter. It was well fitted, however, to set one thinking how to improve matters. Many supplement such a butter route with raising and marketing garden truck, eggs, poultry, etc. This seemed hardly practicable, besides not to our taste. We made observation, began to sell a few pints of cream, which gave good satisfaction, and brought better prices than butter, and cost less work. We also noted the condition of the market, how little cream, comparatively, was used and that the demand was growing. We believed that cream should be more largely used, and also that it would be if a satisfactory article were introduced at a reasonable price, and so began to extend the business along that line. As our dairy was small this soon called for the purchase of the product of another small dairy, and a little later of still another. One of our objects from the first had been to relieve the household of butter making and this, too, was the desire of some of the neighbors. Applications to furnish milk or cream came in ahead of our need, but several more were taken on as business increased.

We changed from plain to Pasteurized cream, and from going once a week to twice a week, and later three times a week was called for, as we had begun to furnish grocery stores, meat markets, etc., where there were refrigerators for keeping the cream. Under the present management confectioners and the ice cream trade have been catered to. Thus by close watching out for chances to increase it and close watching of the quality and condition of the cream, the business slowly grew till nearly the whole store trade of the city was secured. Often it was necessary to do things that for a time scarcely paid, or that were done at actual loss, and faith was called for (as doubtless is always the case with every new venture) especially at turning points, or "divides," between a small business and a possible larger one. For example, it hardly paid at first to change from once to twice, nor later to three times a week, and it called for faith in the enterprise based on judgment of its possibilities. But it had to be done to go forward, and we are not sure but once every day in hot weather and the ice cream season might be advisable. But with proper care and facilities probably it will not be necessary.

During this time of growth or up to a little over a year ago, we had no creamery, not even a regular dairy room, but used the pantry, the back rooms, the spring house, etc. The building of a creamery became a necessity as the accommodations became too small, turning the hand separator a burden too hard to be borne, and washing of bottles, etc., in fact, the whole business was an elephant in the house. For lack of capital we resolved to build the creamery largely ourselves, or with little but unskilled labor for help, which, by the way, is in accord with a theory we have that farmers should do more such work themselves with such help as they have—or it will likely go undone. Work upon the creamery and the careful personal oversight of the cream business, in addition to farm work with scant help proved rather too much. So, carrying out prematurely a plan cherished as a possibility for some time further in the future, when everything had become more thoroughly established, the cream business was rented to others; two men who had for some time been helpers, and were quite familiar with nearly every part of it, from running the separator to delivering the cream in the city. They still follow the business. One, a man with a family, now lives near the city, bottles, sells and delivers; the other, single, attends to the creamery end of it, and delivers it to him in bulk. We sell our milk to him as do the other farmers—but with the advantage of a market right on the farm and so of less travel.

As soon as the creamery plant was sufficiently complete for use above and below work on it was done more at leisure, and it is not yet complete in all minor details, and probably will not be for some time. It is built convenient to spring and brook water, with ice pond and ice house handy. One end of the creamery wall forms part of the wall for the dam. The lower story, or creamery part is of stone and cement (cobble work with trimmed stone outlines), the upper part, for tenement use, is of wood, shingled, and counted roomy and convenient for its small dimensions. We built small preferring to have left a compact, substantial building rather than too unwieldy a one for private dairy and farm use, if the time came when running it for general use became impracticable. But there seems no good reason why such an enterprise should not continue in any farm neighborhood when once well established, unless it should fall to the management of some one with a languid fear lest he should take too much and too steadfast pains and vigilance to make things as near absolutely secure every time, or to some one having a serene unconsciousness of the extent of the damage he does his business when he allows things to go wrong a few times—the cream to go sour or the quality poor. In that case they would soon be confronted by lessening sales and a large and unprofitable surplus on hand. In the cream business as in other affairs, "the prudent man foreseeth the evil and hideth himself," according to the proverb. Better throw a can of cream on the ground than have it go sour on the market. Success in the cream business depends peculiarly on "confidence" and confidence depends on good cream—not the "confidence" of the speculating money lender who wants confidence that the dollar he lends on the bond will appreciate and be worth two dollars 10 years from now, besides the interest. But the merchant wants confidence that he will not be confronted by his customer brandishing a sour bottle of cream, with a still sourer disposition, and his customer wants confidence that the expensive dish she has prepared will not be spoiled by finding too late that she has only sour cream. This confidence once established a ready and growing market is almost assured. Cream will then come, through habitual use, to seem a necessity, not a luxury, as one of our merchants and best customers remarked that it had, when commenting on the growth of the business since we began with him. A. WETMORE.

"Clark" Grass; Cow Peas and Corn.

Last year I seeded about seven acres to Timothy after the Clark method, to the disgust of most of my neighbors. We had no rain for six weeks after the seed was sown, and only about an acre came up at all. That acre happened to be next the road, and I left it and mowed it, getting about 2½ tons of nice hay. This year I have seeded 12 acres to Timothy, clover and Alsike, and though the seed has been sown only a week it is now nicely up, and with an occasional shower I see no reason why that piece of land will not pay better than if sown to wheat to be destroyed by Hessian fly. I don't approve of trying to grow two crops on the same ground at the same time. But I have made so many experiments in the last few years that have not proven very successful, and thereby have been laughed at by my neighbors, that if I can hide anything new I do it.

Just as my silage corn was coming up last May I planted in the rows on about three acres some cow peas, and no one happened to see me do it. To-day they are a sight to behold. The corn is fully eight feet tall, and some of "them beans of Hardy's" are taller. If the Jerseys don't relish that silage next Winter and give ample returns therefor in the churn why then I shall raise no more cow peas. It looks now, however, as though I should plant quite a few of them next year; just what way I don't know.

Seneca Co., N. Y. D. P. H.

Corn and Cow Peas for Silage.

On page 547 of a recent issue of THE R. N.-Y. I see a question asked about mixing corn, Soy beans and cow peas in the silo. The answer given by Prof. I. P. Roberts does not agree with my experience. I tried filling my silo for several years with corn alone. I then tried filling with corn and cow peas, and was so well pleased that I kept it up for several years, till I sold out my dairy. Judging by the way the cows ate them if anything the peas made the better silage. When run through the cutter the green peas would cut very fine and pack very close, and made a better keeping silage than the corn alone, and for me it had one other decided advantage in growing the crop. It is very convenient to have whatever you put in the silo near at hand, and by growing corn and cow peas I could use the same field each year, growing one-half in each and alternating. The fourth crop with this rotation was the heaviest. As soon as the silo was filled the ground was harrowed and sown to rye; 100 pounds of raw bone to the acre was the only manuring it had. The calves ran on the rye all open weather during the Winter, and when it started to grow in the Spring my herd of 40 cows were hardly able to keep it down till the Blue grass got a start, when it was plowed again, and left alone for several weeks; then thoroughly prepared and planted to corn and peas. There is no trouble to get them to come together with me. I plant our medium variety of corn about 10 days before the Whippoorwill pea, and they have generally come together about right. There are others here practicing this plan, who like it. I do not claim that it does away with the necessity of feeding concentrated feeds, but that it makes a better silage, and that it has its advantages. There is no rotation I have ever tried where as much feed could be got from the same piece of ground each year.

Clark, Ky. N. F.

PORTO RICO FOR AMERICANS.

A CLEAR STATEMENT OF CONDITIONS.

Climate, Crops and Soil.

The question is often asked: Are there any profitable business openings for Americans in our new West Indian possession? The writer will endeavor to outline the general situation there, so that the reader may balance the pros and cons and judge for himself. Porto Rico is a land which has until very recently been under an oppressive form of government. The laborers, or peons, are extremely poor, and live in a most primitive way. There is no large, influential middle class as in the United States, where diversity of occupation, free schools, and a government whose basic principles, at least, are democratic, furnish favorable opportunities for the average man. These conditions, and the dense population, close the door for the American laborer in Porto Rico. The average wage of the peon is 50 cents per day on the sugar estates, and 40 cents in the interior. The man of small means, especially if unacquainted with the climate and the Spanish language, to succeed in Porto Rico must possess skill in some line which the Island lacks. It is safer for such to find employment and become acquainted with local conditions and values before investing in land. The opportunities for investment, especially for the cultivator who can afford to wait a few years for full returns, are now exceptional, as foreclosures on mortgaged lands are beginning, after having been held up since the American occupation. For the first time in the history of our country, we have a purely tropical territory, open for settlement, under stable American government, a region where oranges, pineapples and other tender fruits and vegetables can be grown without a check from frost or cool weather in the Winter months, as the mercury usually stands in the sixties, during the nights of January and February. These conditions insure a rapid growth, whereas in Florida at the same time wide fluctuations of temperature occur, involving enormous loss.

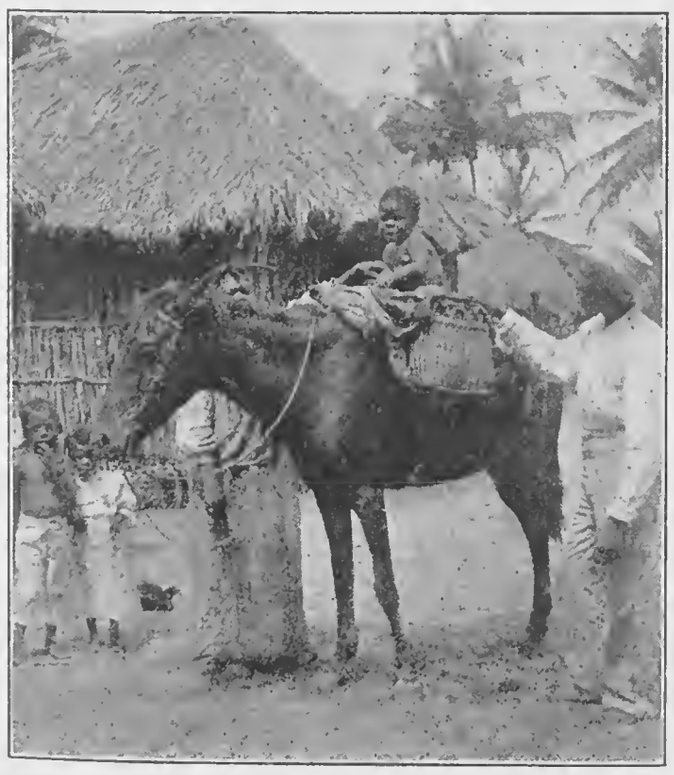
Free trade with this country, which takes effect March 1, 1902, is practically a bounty upon all the products of Porto Rico which pay a duty when imported into the United States, over the same products when imported from Cuba, Jamaica, Mexico and other tropical countries, which is sufficient to make a handsome profit in itself. At present 85 per cent of the duty has been removed. Porto Rico has good shipping facilities, as the fine five-days' steamships of the Red D Line and the New York and Porto Rico Steamship Company together supply an excellent weekly service both ways between Ponce and San Juan and New York. Labor, while uninstructed in modern methods of tillage, is quick to learn; it is much superior to the negro labor of Jamaica, being a mixed blood, largely Spanish. It should be said, however, that Porto Rican labor, to be effective, must have supervision which is continuous and intelligent, or it is dear at any price.

The climate of the Island is more healthful than that of most tropical countries. It is hilly, there are but few swamps; there is a large number of streams of pure water, and the trade winds prevail throughout the greater part of the year. The most marked characteristic of the climate is the steadiness of the temperature. The average at sea level is about 75 degrees for January, and about 83 degrees for July. A northern man can live and work out of doors in the tropics if he observes such rules of health as are required in our warm Summer weather, which is strictly tropical for weeks at a time. There are no oppressive nights in Porto Rico in a properly-ventilated sleeping room. Among the hills the nights are quite cool; there is a very heavy dew, and blankets are required. The first floor of houses should be raised

A PORTO RICAN HOME. FIG. 275.

several feet from the ground, to allow free circulation of air below. Persons working in the field should push their work early and late, taking a long rest at noon. There has been remarkably little sickness among the Americans—soldiers and other residents on the Island. The sickly appearance of many of the natives, especially in the interior, is due to poor diet and unsanitary conditions of living. There are a few localities subject to malarial fevers. These are swampy sections, and particularly when care is not taken to use rain water for drinking purposes. In most parts of Porto Rico, however, the water from the small streams is good when filtered. Ice is only obtainable in the larger towns. The water is cooled in a large porous jar, which stands in the air upon the balcony and receives it as it drops from the filter. To maintain full vigor a northern man should return to the North for a few weeks once a year or once in two years, it is said, as the continuous warm weather becomes wearing in time. A liberal and appropriate diet and the practice of taking a daily shower bath, the writer believes, as the result of his own experience, will go far toward combating the depleting effects of a tropical climate.

The political situation is satisfactory and encouraging. There is no party opposing American sovereignty, although the wealthy mercantile and landed class strenuously object to the tax law passed by the



RAPID TRANSIT IN PORTO-RICO. FIG. 274.

A GIANT FERN. FIG. 276.

recent session of the Legislature, a law which is based on the principles which prevail in our States. This law was passed by the popular party, and was originated by Dr. Hollander in the Executive Council. The business outlook is vastly better than it was a year ago, the marked improvement dating from the Civil Government law which went into effect the first of last May, and fixed the tariff status of the Island. Municipal affairs are still carried on in much the same way as in Spanish times, and Americans complain that they do not get justice in the courts of the alcaldes or mayors—at least in many places; but the larger affairs of the Island are being rapidly improved. Under the progressive Superintendent of Instruction, Dr. M. G. Brumbaugh, rural schoolhouses are being built, each with its acre of land for a school garden. They will be equipped with garden tools, and instruction given in practical work. This manual training is especially important in Porto Rico, because the natives are behind the times in their knowledge of farming and gardening, and there are few opportunities open to them in other lines. The recent school disturbance in San Juan—which is the most Spanish in sentiment of all the Porto Rico towns—was only possible because of the inefficiency of municipal officers and police, and their lack of coöperation with the Department of Education, which is under insular and American control.

At the present, Porto Rico is not a desirable country in which to rear a family, as the social and educational status of the people is low. In a few years conditions will be vastly improved. Railways will penetrate the rich valleys of the interior. American gardeners and fruit growers will bring new industries, new implements and new methods. The American public school will have produced a generation of young Porto Ricans more intelligent than the present, and understanding the English language and something of American institutions. When that time comes, Porto Rico will have much to commend it for family life; its balmy Winter, where coal bills and heavy clothing are not costs to be considered, and the fact that expensive buildings are not required for comfort, coolness and not warmth being the desideratum. The cost of living is also immensely reduced by the fact that the bounty of nature is such that food for man and beast is produced throughout the year, and the husbandman can market his crops in every month, and is not limited, as under the exacting conditions of northern agriculture, to a few months of production. The charming climate and picturesque scenery of Porto Rico are attracting many American visitors who desire to escape the vigors of our northern Winter months, and some of these remain as set-

tlers, or become investors, and these will be a growing stream as our fruit growers and gardeners realize the rare opportunities now open there. Next week I will try to give in some detail an account of the various openings in horticulture on the Island. Figs. 274, 275, 276 and 277 represent scenes in Porto Rico.

F. M. PENNOCK.

THE COWS AT THE PAN-AMERICAN.

The dairy contest is still going on, and will continue until November 1. Week before last the Jerseys made a little spurt but, as will be seen by the following record for week ending August 20, the Guernseys are still leading. Good judges who study the cows say they are well pleased with the Red Polled cattle. They come near to filling the bill for "general purpose":

Breeds.	Milk, lbs.	Butter, est. lbs.	Value of butter.	Cost of feed.	Profit on butter.
Short-horn	1129.4	48.00	12.00	6.07	5.93
Holstein	1393.7	53.63	13.40	6.58	6.82
Ayrshire	1112.7	50.73	12.68	5.05	7.63
Jersey	982.7	50.86	12.71	4.60	8.11
Guernsey	938.6	52.66	13.16	4.49	8.67
Brown Swiss	1078.7	47.33	11.83	4.85	6.98
Red Polled	1068.7	49.87	12.47	5.10	7.37
Polled Jersey	765.3	41.91	10.47	4.00	6.47
Dutch Belted	971.5	39.37	9.84	4.78	5.06
Freneh-Canadian	830.3	39.26	9.81	3.64	6.17

The following table gives the record for the week ending August 27. The Jerseys gain a little on the Guernseys in actual profit. The larger breeds, like Holstein, Short-horn and Brown Swiss, are giving most milk, though the Ayrshire crowds them hard. It will be seen that if one is figuring from a milkman's standpoint, a quart of natural milk would come cheaper from the Ayrshires than from Jerseys or Guernseys. Why does the Polled Jersey make such a poor showing?

Breeds.	Milk, lbs.	Butter, est. lbs.	Value of butter.	Cost of feed.	Profit on butter.
Short-horn	1005.5	44.20	11.05	5.85	5.20
Holstein	1272.5	49.63	12.40	6.31	6.09
Ayrshire	1004.4	44.32	11.08	4.65	6.43
Jersey	880.6	48.74	12.17	4.36	7.81
Guernsey	871.6	49.60	12.40	4.42	7.98
Brown Swiss	1008.8	43.44	10.86	4.71	6.15
Red Polled	945.6	45.68	11.42	4.69	6.73
Polled Jersey	676.0	38.49	9.62	3.81	5.81
Dutch Belted	838.7	34.57	8.64	4.63	4.01
Freneh-Canadian	792.2	38.98	9.74	3.55	6.19

THE GOVERNMENT AND THE APPLE TRADE.

The Agricultural Department Tries Experiment.

Referenee has been made to the plan of the National Agricultural Department to develop the export trade in apples. Some of the daily papers have eritieised the plan, claiming that it establishes the prineiple of a bounty on exports. We are glad to give the following clear statement of what the Department has in mind:

The contemplated experimental export shipments of fruit are to be made primarily for the purpose of determining the requirements of the export trade in these products, with a view to insuring the safe delivery of American fresh fruits in sound condition in foreign markets. It has been found true in many cases that fruit, apparently sound when shipped, deteriorates rapidly in transit, arrives in bad condition, and sells at prices so low that no profit remains to either the producer or the shipper. Part of this deterioration is believed to be due to unsuitable temperatures and conditions in transit. Much of it is undoubtedly due to improper methods of picking, packing, storing and handling on the farm, and somewhat to the use of packages poorly adapted to the purposes for which they are used. To determine as accurately as possible just what the requirements of this trade are, it is proposed to make certain experiments in fruit marketing, storage and shipment, as authorized by Congress under the appropriation for "Pomological Investigations," for the fiscal year 1902. This clause is as follows: "To investigate in coöperation with the other divisions of the Department and experiment stations of the several States, the market conditions affecting the fruit trade of the United States and foreign countries, and the methods of harvesting, packing, storing or shipping fruits and vegetables, and for experimental shipments of fruits to foreign countries, for the purpose of increasing the exportation of American fruits, and for all necessary expenses connected with the practical work of the same."

In the experimental shipments it is of course necessary to utilize existing commercial facilities for transportation and refrigeration. As the fruit for these shipments cannot be produced by the Department, it is necessary to secure it from other sources, and as the shipments are to be of experimental character, to determine the requirements of the export trade, some of them must be expected to result in the loss of a part or even the whole of the shipment. An experiment that demonstrates that a certain method is impracticable, or is at least attended with great risks, is frequently of value in pointing out to the farmer what he should avoid. It was to cover such cases as this that the appropriation was recommended by the Secretary of Agriculture in his Annual Report for 1900, upon which the item in the appropriation was based.

Coöperation with fruit producers and dealers being considered desirable in this work, and in fact necessary, to accomplish the desired end, it is proposed to guarantee to those who furnish fruit for these experiments, which are to be under the supervision of the pomologist in the Bureau of Plant Industry, a definite net return per package on fruit thus shipped under the direction of the Department, rather than to purchase the fruit outright and sell it on Department account. The advantages of this plan over others that have been suggested appear so obvious, both as affecting the outcome of the experiments and the dissemination among fruit growers and shippers of the information sought to be obtained through the work, as to need no further comment. The shipments, though necessarily made through commercial channels, are to be conducted wholly along experimental lines in accordance with the letter and spirit of the law, as expressed in the clause above quoted. The Department does not enter into partnership with the growers, nor offer them a bounty or subsidy in any form, but simply guarantees to them the home value of the fruit needed for use in the coöperative experiments. Certain criticisms recently expressed in some of the daily papers appear to be based upon a misconception of the purpose of the Department, and of the intention of Congress in framing the bill which authorizes the work.

J. H. BRIGHAM.
Acting Secretary Department of Agriculture.

J. H. HALE TALKS.

A representative of THE R. N.-Y. recently met Mr. Hale, the peach man, and had a few minutes' conversation with him.

"Do you have more trouble with fungus diseases in your Georgia orchards than at the North?"

"Not so much. About the only fungus disease that bothers us is brown rot.'

"What treatment do you use for this?"

"Before the buds started last Spring we sprayed

VIEW OF SAN CRISTOBAL, PORTO RICO. FIG. 277.

with Bordeaux Mixture until everything was blue. Then we sprayed later with a weaker solution. This is a help, but there is some danger of burning the leaves, even with a half-and-half solution."

"Do you find it possible to save the early, easily-rotting varieties in this way?'

"Some of the early sorts seem less resistant to disease than others. I experimented with two plots of Carman, sprayed both equally the first time, but gave only one the second spraying. The plot that got only one dose rotted more than the others."

"Does curculio trouble you much?"

"Yes; we did a big job of jarring off and catching them this Spring. People said that I could not jar so many trees, but I told them that it was only a matter of arithmetic."

"Did you use the wheelbarrow machine?"

"O, no! That's too slow. It does very well for a garden patch or small orchard, but where there are thousands of trees to jar some hustling is needed. We took two sheets, with a notch in the edge of one, so that it would go around the trunk of the tree. These sheets covered a space 12 feet square. A boy took hold of each corner; a man walked with them to hit each tree a hard whack, and we got along rapidly. I sent the bugs to the experiment station people, who counted them, and will give the number destroyed in their next statistical report."

"How do Carman, Waddell, and Emma do with you?"

"Carman is a fine peach; there is not much choice between that and Waddell. I want a year or two more to decide which is really the better. I would not advise planting Emma. It is a good peach and sells well, but it is a shy bearer."

"What would you advise planting for the South other than Elberta?"

"Elberta has been overdone. Any good peach that will grow and ripen earlier will sell well. Belle of Georgia is a desirable variety."

"Are you in the apple business to any extent?"

"I have set out several fair-sized orchards in Connecticut, nearly all Baldwin. That is the best variety for this section."

"What about Ben Davis, Mr. Hale?" said a bystander. "There are some Ben Davis trees that are well loaded and will bring a good price this year."

"Yes; and I can show you a whole lot of places where one can make money by keeping a saloon; but a man won't do his fellow man much good by keeping a saloon or raising Ben Davis apples."

W. W. H.

WAGES IN THE GRAPE BELT.

Wages in this section are for men about $1 to $1.25 per day in grape harvest; boys, 75 cents to $1. Some good hands are in demand at better than $1.25; this is for day hands without board. By the month with board $18 to $25; probably $20 would be a good average. By the year on fruit and grape farms $15 to $25, with house, garden, cow pasture, etc. Some good men are in demand at $30 to $40, with allowances as above. Trimming is mostly done by men in February and March at about $1 per day, or about $1.25 per acre. Tying is a woman's job; pay about 75 cents per day, or $1 to $1.25 per acre. March and April is the time; no Summer tying is done. Picking and packing is mostly done by women and girls; over 5,000 find employment from six to eight weeks every Fall in this belt. Not much day work is done by these people; it is mostly by the basket or crate. Crates or trays for bulk stock hold usually about 35 pounds; the price paid the women is from 2½ to three cents per crate. Crates are taken to vineyard and when filled are covered and drawn away by day help, men or boys. About 40 to 45 crates is the average day's work for the pickers; some, however, easily do 60 to 75 a day. Grapes go to market in these packages, going from vineyard direct to cars. Baskets used are eight-pound and four-pound, holding about seven pounds and 3¼ pounds of grapes respectively. A large amount of grapes is packed in these baskets in the vineyard. Women receive for this work from one cent to 1¼ cent for large basket and one-half cent to six-tenths cent for small. About 100 baskets per day is good work, but some can put up 150 to 175 of the eight-pound size. They are filled about one-half inch more than full, and then drawn to packing house, where they are left till next day. By this time the stems will have wilted and grapes settled so cover can be put on without injury. This work is done by day help. Another method is for women working by day at 75 cents to 80 cents to pick grapes into trays to be repacked next day by other women in the packing houses. Prices for packing in the house are same as in field, so it of course costs the grower more. Grape time is a busy time here, as in this belt from about Silver Creek, N. Y., to Erie, Pa., there are 8,000 carloads of grapes to be disposed of in 60 days.

DO RAILROADS WANT PASSENGER TRAFFIC?

While certain business methods of farmers are often held up to ridicule, there are some things common enough in the business world that might well astonish the ordinary farmer. I have before me a poster announcing excursions to the Pan-American. If the outside Pan-Americans, from Panama to Patagonia, have as much difficulty as we do in getting there, the show must be conspicuous by their absence. It might be supposed that the railroads are anxious for passengers, inasmuch as they were created to haul people as well as freight. But the restrictions, conditions, time limits and general red tape and uncertainty connected with these tours are enough to scare the most adventurous Yankee. If he doesn't read his ticket every meal as regularly as he takes his food, he is liable to get left. In Buffalo some of the railroads require that the ticket bought at this end of the line be "registered" before it will be accepted on return, and for this "registry" charge an extra dollar. It may have been lost, strayed or stolen, and failure to prove property every little while leads to the inference that the holder is a thief. In other words, there is more anxiety to hedge in passengers with barbed-wire restrictions of all kinds than there is to get their money for carrying them around. At the present rate of progress it will not be long before a certificate of good moral character will be exacted of all to whom tickets are "sold at a reduced rate," the same as now in some States it is required of those who apply for admission to the bar, and it would be little less ridiculous in the one case than in the other.

How many apples would a farmer sell if he asked $2 per barrel in consideration that they should not be "assigned" or "transferred," otherwise the price would be $2.50, with the still further "condition" that if not eaten within 10 days they be returned to the seller? What difference does it make to any company whether it carries a man or his neighbor, so long as so many miles of travel have been paid for in advance? There is no doubt but "good reasons" exist for the limits and restrictions in railroad tickets, nevertheless I submit that if money is what they are after, they could pay larger dividends by oiling the wheels of travel, rather than by tying them or putting on brakes.

ALFALFA IN SOUTHERN OHIO.

April Sowing With Barley.

I know of no Alfalfa in this section of the country that has been growing more than three years. About the middle of July I went to see a plot of about four acres that had been mown twice and was again making a nice start. This was on high limestone upland; it is the second season's cropping for this field. The owner was so well pleased with results that he sowed another plot last Spring on bottom land. This at the time I saw it was making a good start, after having had the protecting crop of oats or barley cut off. This had been overflowed by a flood from an unusually heavy rain; some of the stubble or growth left lying on the land was at least 18 inches long. Another plot on bottom land that was sown last year gave at first cutting this year about two tons of hay per acre. Last year the stand was not thought to be very good, but the growth this year was very thick, showing the strong tendency of the plant to put out numerous shoots from the crown. The second cutting from this plot gave about one ton per acre. My impression is that the first crop was not cut soon enough. The second I know stood too long, as it was almost in full bloom when cut. The wet weather we have been having will probably make the third cutting better than the second. In another instance a field sown one year ago last Spring, that was pastured during the Summer and Fall, did not show up satisfactorily this year; this was on sugar-tree land, rather high and rolling. Still another field sown last Spring one year ago, sown without a shelter crop, was clipped once and pastured with cattle later in the season. This field, I understand, stood the Winter, although cold, wet land naturally. Still another field the freezes of last Winter lifted so badly that it was plowed under last Spring.

I stood back from trying the plant till last Spring, going under the impression that I had no land suitable to make it successful. This impression I gained from what I read in the farm papers and bulletins. Observation last year led me to believe that it was not definitely known on what kinds of soil it would make profitable growth, if given an intelligent trial. With the object in view of knowing something more of the possibilities of the plant, and with a hope that it would prove a success, I sowed an 11-acre field April 9 and 10 last, using a little over 16 pounds of seed per acre, and not quite 1½ bushel of barley per acre. I could not have selected during the last decade a Spring more favorable for the trial. There are four or five kinds of soil in this field; about one acre of black soil, with water but a few feet below the surface; two or three spots, aggregating nearly one acre, of stiff red clay, the hardest of all land to get in order after Spring plowing. Then there is a south side of a hill near half an acre in extent, that is limestone gravel, not bad for road building. This plot always starts the corn rapidly in the Spring, but it never ears right, because it burns before the growing season is over. The highest part of this is at least 20 feet above the black land. The remainder of the field is clay land, on which, in cutting tile drains, we strike considerable limestone, pebbles, or gravel, three feet down. The seed was sown from the grass-seed sower on the drill, sowing the seed in front of the hose. The plants show an even distribution over the land. A field sown on another farm, the seed thrown back of the hose, I suppose, shows nearly all the plants in the hoe marks.

On my field the slowest places to start were the red clay parts. The black soil on the gravel bank started first. Much of it on these favorable places was six inches high when the red clay points hardly made a showing. After harvest, the latter part of July, I gave the clay points a topdressing of barnyard manure at the rate of 12 loads per acre. Good rains since have caused the Alfalfa on this red clay to make an excellent start, so that now it is well up with the remainder of the field. Part of the field has been clipped twice since the barley was harvested, a second cutting so soon to keep back the foxtail that made too strong a showing on part of the field. The rate the Alfalfa is growing now may make it necessary to go over the whole field before the middle of September. I do not want the plants to exhaust themselves blooming. Next year, if the hay cuttings are satisfactory, it will be my aim to topdress the field with barnyard manure some time during the season; I think I can prolong its usefulness in this way. If it is going to be my most profitable crop it will deserve this care and treatment. I feel sure that three cuttings in a year for a decade will certainly impoverish the land. The great depth to which the roots penetrate may prevent the noticeable deterioration in the soil made by surface-feeding plants. If I do not use the manure production from this crop in helping make the crop, what am I to do with it? For I do not want to rob this, the poorest field on the farm, to build up the others.

Ross Co., O. JOHN M. JAMISON.

CORN-BINDING MACHINERY.

At Fig. 278 is shown a corn harvester at work on the Cornell Experiment Farm. In witnessing the well-nigh perfect work of this machine it is pleasant to remember the first attempts at binding corn. Nearly 12 years ago THE R. N.-Y. printed a picture of a machine made at the suggestion of Prof. I. P. Roberts. At that time no one knew just how to grasp and cut the hill of corn with fingers of wood or steel so as to give the best imitation of the human hand and arm. In all farm machinery, except that of fitting the ground for a crop, the ideal of the inventor has been to imitate the hand work of a skillful man. The first corn binder was a heavy, cumbersome affair, not at all suited to the conditions which are found on the average farm. It went at the work in the wrong way. A man in cutting corn gets his arm around the hill and holds it tight for the knife; then, with the aid of shoulder, hip, and knee, it is pulled and shaken into place. This is what the corn binders were asked to do, and it is wonderful how the inventors have responded. On the farms where a good-sized area is put in corn, the work of cutting is now as easy as grain harvesting after the binder. The horses now swing the corn knife or grain cradle, and men only pick up and shock the bundles. The introduction of this machine has changed the character of farming in many places. It is of especial value where corn is grown for the silo. It saves labor at a critical time, and expands the productive power of the farm which supports only one good team of horses. We believe that before many years most of the corn in the country will be cut with these machines—either owned by individual farmers or carried from farm to farm, much as traction engines or thrashers are carried at the present time.

A CORN HARVESTER AT WORK. FIG. 278.

FACTS ABOUT "FLY-PROOF" WHEAT.

Every year that the Hessian fly attracts unusual attention by its ravages, there are usually certain varieties or certain fields of wheat which suffer much less than others, and in consequence a few varieties are heralded as "fly-proof." Soon after the insect began its ravages in this country, more than a century ago, the Underhill wheat became a favorite, and it bore its "fly-proof" reputation for many years. From 1850 to 1880 several varieties gained a reputation for resisting the fly in certain regions; as the Mediterranean variety in the Middle States, in central New York the Lancaster variety, and in Michigan the Clawson. And nearly every Hessian fly year other or newer varieties supplanted the former favorites, so that there have been a score or more so-called "fly-proof" varieties of wheat in the past century. There has been considerable discussion in the literature about these "fly-proof" varieties, and the remarkable immunity from the pest of certain varieties in New York this year, as related in Bulletin 194 from the Cornell Experiment Station, has again opened the discussion. For example, Dawson's Golden Chaff wheat has apparently, without exception, almost perfectly resisted the attacks of the fly all through New York this season, and the varieties known as "No. 8," "Prosperity," "Democrat," "Red Russian," and "White Chaff Mediterranean" are also reported as suffering but little from the pest. Although the Dawson's Golden Chaff made such a remarkable showing in New York, in its original home in Canada it suffered very severely, and will not yield more than one-third of an average crop in the infested areas. In the experimental plot at the Ontario Agricultural College the following varieties were but slightly infested this year: Imperial Amber, Egyptian Amber, Michigan Amber, and Early Genesee Giant, and the following varieties were badly damaged: Dawson's Golden Chaff, Turkey Red, Buda Pesth, Clawson, and Treadwell. So it goes; one variety may resist the fly in one locality and not in another, and a variety which is equally resistant under all conditions and locations has not yet been evolved. The gist or whole truth of the matter is that no variety of wheat is absolutely "fly-proof." Even Dawson's Golden Chaff seemed to be as badly infested as other varieties in the Fall on the Cornell farm, and yet it was remarkably free from the fly this Spring. But we cannot escape the fact that some varieties do sometimes show a remarkable resisting power, even when grown in the same field with others.

This brings us to the all-important question: Why are certain varieties more resistant to the fly than others? It would be worth millions of dollars to American wheat growers if it were definitely known what qualities of the wheat or what other conditions are necessary to make a variety "fly-proof" in all locations. No one knows, and but little data has yet been obtained on this point, but there are some sensible notions proposed to explain the why of it. If we only knew all about it, our wheat breeders would know just what kind of a wheat to develop, and could then breed along those lines. But I doubt whether such a millenium will ever come for our wheat growers. The so-called "fly-proof" varieties often have coarse and siliceous stems, enabling them to stand and not break over from the presence of the fly; also, varieties which tend to develop secondary shoots or "tillers" are considered preferable during Hessian fly years. There seems to be no difference in the susceptibility of the bearded and the beardless varieties, but some observations in California several years ago gave indications that early varieties were not so badly infested. Some seasons the red varieties, which the millers often prefer, suffer less than the white kinds, but this did not hold true in Canada this year.

While there is no doubt that some of the resisting power against the fly is inherent in the qualities of the wheat itself, yet we believe that much of it often comes from the kind of soil, its location, and the way it is prepared and fed. Oftentimes wheat on unusually good soil will make a good crop in spite of the fly, and yet there were cases this year in New York where Dawson's Golden Chaff on soil not rich enough to enable it to make a large yield, seemed not to be affected by the fly; how long this variety will retain these resisting qualities in New York no one can tell. We would not advise farmers to depend solely on the "fly-proof" reputation of a variety, and expect it to yield satisfactory crops under all conditions. Test the so-called "fly-proof" varieties, and select from these, or from others, the one which you can make produce the best crops on your soils, and the one that the market wants. We believe that often a farmer can raise a good crop of wheat in spite of the fly if he will properly prepare and feed the seed bed, which must be in good soil; especially is this true if he will also decoy the fly into narrow strips of wheat sown early (in August) and plowed under just before the main crop is sown, late in September. In short, the resisting powers of wheat against the Hessian fly may often depend largely upon the forethought of the farmer himself in choosing and properly preparing the seed bed, using the decoy strips of wheat, and sowing late. We believe these factors will enter more largely into the causes which may make a variety "fly-proof" than any "tillering," "stalk-stiffening," or other qualities which may be inherent in the seed. Give the variety which does the best on your farm, and is best adapted to your needs or markets, the best possible chance that you can with your knowledge of soils and their preparation, and sow at the right time, and we believe you will win against the fly nearly every time.

M. V. SLINGERLAND.

IT will require a rich man to provide two apples each day for personal eating this year. Most city people will pass so little apple down their throats that even the Adam's apple will grow smaller.

BITS OF NATURE STUDY.

Introduction.

At the outset I should like to have a little talk about the meaning and purpose of nature study. Nature study is not the same as elementary science. Science presupposes a teacher and a class room, or its equivalent; nature study does not. Science demands a rigid search for exact truth and the whole truth; nature study does not. Science calls for a systematic order of procedure; nature study does not. The purpose of science is to acquire knowledge; the purpose of nature study is to awaken the interest, enlarge the sympathy and add to the enjoyment of life. Nature study simply asks for an intelligent interest in the thing nearest at hand. It does not insist upon complete truth, nor even upon exact truth. It invites the observer to a closer companionship and a deeper love for nature, rather than to a detailed scrutiny of her ways. It presupposes no previous training, and offers as much pleasure to one who knows nothing of a subject as to one who knows much. It asks the student to take in hand the seed, the leaf, the stone, or the insect and read the story written there, rather than one written about it in a book.

A YOUNG APPLE SHOOT. Fig. 279.

The best article on nature study would be the one which would cause the reader to throw it down unfinished to betake himself out of doors in search of the object itself. These articles are written with the hope that the reader will go to the object itself for most of his information. It will always prove more interesting than the article.

The Birth of a Strawberry Plant.

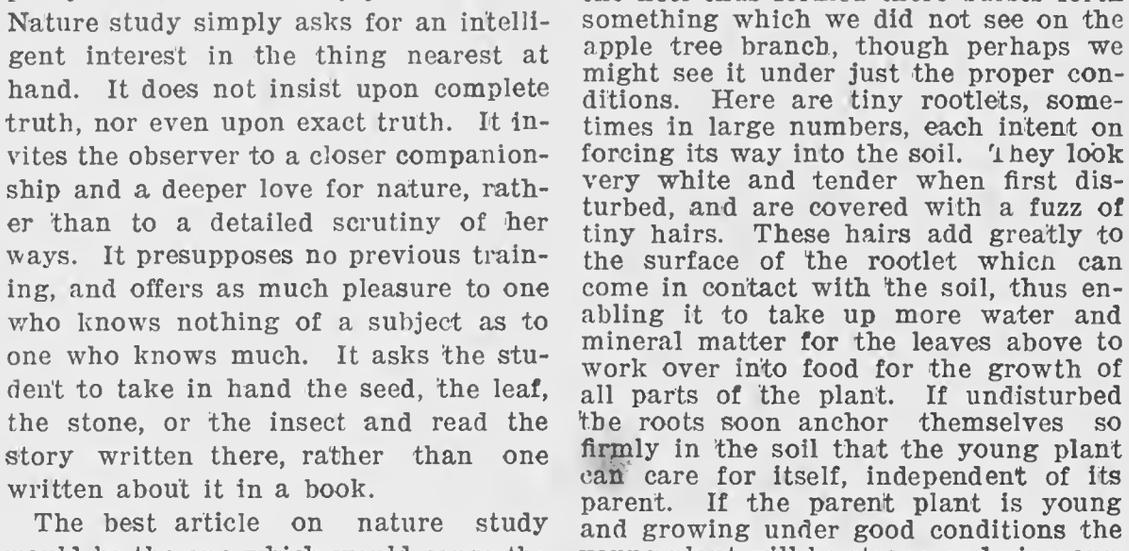
An apple tree and a strawberry plant seem very unlike. Yet we may understand the strawberry plant better if we examine carefully a young shoot from an apple tree. It should be a shoot of the present year's growth. Notice how the leaves are arranged, and how an insect would circle around the twig if it were to climb from leaf to leaf, as a boy would climb from branch to branch on a tree. Notice the little leafy or scaly points, at the base of the leaf stalk, one on either side. The botanist calls these stipules, and you will find them more prominent on the strawberry plant. On the apple twig you may not find them at the base of every leaf, for they fall away in time. Do not overlook the bud between these, which is sometimes almost hidden by the leaf stalk. Do you find such buds anywhere else? This location at the base of the leaf stalk, between it and the twig, is called the axil of the leaf. None of these buds seems to grow. What becomes of them? To answer the question look at the older part of the branch, the part which grew last year. How many leaves are there at each bud on this year's growth? How many at the buds of last year? Have these buds lengthened any? Did the shoot you are examining grow from such a bud?

Now look at a strawberry plant. Do you find anything in the axil of its leaves? If so, it must be a bud, like that of the apple tree shoot. Have any of these buds begun to grow? We should expect them to grow into branches. What kind of branches do they make? The leaves on the apple tree shoot which grew this year are some distance apart. On some of the short side branches they are crowded close together. On these strawberry branches they are still farther apart. Notice the first one. There is a bud in its axil. What comes from the bud? The second joint is not like the first. More than one leaf appears here. The branch seems to divide. From the axil of one leaf a branch continues, while at the same time there develops a short thickened stem, more like the parent plant, or like the short branches on the two-year-old wood of the apple tree. This branch takes a sharp turn upward. At the heel thus formed there bursts forth something which we did not see on the apple tree branch, though perhaps we might see it under just the proper conditions. Here are tiny rootlets, sometimes in large numbers, each intent on forcing its way into the soil. They look very white and tender when first disturbed, and are covered with a fuzz of tiny hairs. These hairs add greatly to the surface of the rootlet which can come in contact with the soil, thus enabling it to take up more water and mineral matter for the leaves above to work over into food for the growth of all parts of the plant. If undisturbed the roots soon anchor themselves so firmly in the soil that the young plant can care for itself, independent of its parent. If the parent plant is young and growing under good conditions the young plant will be strong and vigorous. If the parent is old and exhausted by much fruit bearing the young plant will be weak also. FRED W. CARD

Propagating Lily Bulbs.

F. E. K., Troy, N. Y.—When and how are lily bulbs propagated? I refer to the Candidum, large flowering, and Croceum type. Give careful directions how successfully to increase these bulbs.

Ans.—Lilies of the above type multiply by bulblets forming in the soil about the base of the stem. They are most numerous on old bulbs that have not been disturbed for several years. The little bulbs may be planted in frames of good soil enriched with old rotted manure. The bulblets should rest upon and be embedded in a layer of sand about two inches thick. They may be placed two or three inches apart in rows wide enough to hoe between, and covered with about four inches of good soil. The sides of the frame should extend 12 to 14 inches deep in the earth, to keep out mice and moles, as the former are very fond of lily bulbs. No sash is needed in Winter, but a mulch of chopped hay or straw after the ground is frozen is very beneficial. The frame should have perfect drainage, as standing water is quickly fatal. The bulblets may grow in such a frame two or three seasons, when they will be large enough to plant out. Some lilies are propagated from the bulb scales, which may be treated in the same manner, but planted more thickly and at a less depth, but the process is uncertain and needless with the above types. After the stems have made a few inches of growth lilies are much benefited by a mulch of old manure.



THE GROWTH OF A YOUNG STRAWBERRY PLANT. Fig. 280.

Brown Rot in Grapes.

V. T. B., Topsham, Me.—I send a bunch of grapes; can you tell me what is the matter with them, and what is the remedy?

Ans.—The grapes you send are affected with the brown rot, one of the most destructive pests of the grape. It is very prevalent this year, its spread being favored by the extremely hot and damp weather. There is no cure for it after the grapes are affected, and the only remedy is to spray the vines in the Spring, before the buds open, with full strength Bordeaux Mixture (six pounds each of lime and copper sulphate to 50 gallons of water), and later, as the fruit develops, with half strength.

Choisy Cherries.

N. G. H., Rothsville, Pa.—In reply to C. F. C., page 563, would say that we have five Choisy cherry trees planted eight years on gravel soil. We had a few cherries this Summer and find them to resemble the old-fashioned Amber cherry so much that we are inclined to graft trees next Spring with a valuable dark variety that we have growing on our place. Amber cherries sell for three and four cents on our markets, when other varieties sell for six to eight cents per quart.

Ans.—This is the right sort of facts to have stated. There is no doubting the common experience of marketmen, that they find more ready sale for dark cherries than for light ones. For home use we can grow any variety, regardless of color, that we desire; but for market we must yield to the popular demand, at least in some degree. H. E. V. D.

Liquor Follows the Flag.

H. E. G., Conn.—Will The R. N.-Y. give us the facts about exports of intoxicating liquors to the Philippine Islands? I have heard many conflicting statements.

Ans.—The following figures are the best we can obtain from the Government:

	1896.	1900.
Malt liquors (bottled) doz. bottles	835	470,451
Malt liquors (unbottled) gallons	64	16,080
Brandy (gallons)	—	18,063
Bourbon whisky	—	58,056
Rye whisky	—	5,371
Other spirits	—	1,054

The total value of the liquors exported to the Philippines last year was $717,792—by far the heaviest "agricultural" item in the list—in fact, the entire exports to the Philippines in 1900 amounted to but $1,656,871. Why these intoxicating liquors should be classed as "agricultural" is more than we can understand. Some of the other items of export in 1900 were: Horses, $211,550; mules, $230,400; dairy products, $25,941; meat products, $34,128; breadstuffs, $168,726. Thus far the Philippine trade seems to consist in providing food and drink for the American Army and office-holders.

Thorburn's
BULBS
Our catalogue of high-class bulbs for fall planting is now ready. All who have not received a copy are invited to send for it. We mail it free.
J. M. THORBURN & CO.
36 CORTLANDT STREET. NEW YORK.

OUR FRUIT TREES
Ornamental Trees, Vines and Plants
are grown on the banks of the Hudson River, where with favorable climatic conditions, a perfect season, rich soil and thorough cultivation, we have matured the finest and most complete list of stock ever grown in the Hudson Valley. Quality always our first aim; personal inspection invited. Fall planting gives best results. Our Summer and Autumn Catalogue free to all readers of The R. N.-Y. Ask us for information you may need on horticultural matters, and you will have answer in next mail.

EVERYBODY'S GARDEN.

SPINACH.—The Winter season is generally so barren of any green vegetables other than greenhouse products, that anything in that line which can be easily and cheaply grown, always finds a ready market, at remunerative prices. Spinach being essentially a cold-weather plant, meets all these conditions, and the culture is so cheap and easy that it should not be omitted either from the home or market garden. It is used entirely in the cooked state for greens, and is excelled by no other vegetable for that purpose. The culture is very simple, and for Winter or early Spring use, the seed should be sown during the month of September for localities north of Philadelphia, and south of there it may be sown then or even later. South of the above locality, it will require no protection, but in the North a slight protection of straw, leaves or other litter is essential. It may be cut at any time when the depth of snow will permit, and when frozen should be covered with cold water for a few minutes to draw out the frost before cooking. In preparing for market, all yellow or otherwise imperfect leaves should be removed, washing if necessary, and marketed in bushel baskets, or, if shipped, it should be packed in barrels. The ground should be very rich; in fact, there is little danger of overdoing that part of the work, and, if possible, it should be plowed some little time before the seed is sown, so that the weed seed near the surface will have time to sprout and be killed by culture. For Winter or early Spring use it is preferable either in small gardens or for market purposes to broadcast the seed at the rate of 10 to 12 pounds to the acre. Spring seeding may be done either in drills or broadcast; some prefer however, the drilling one foot apart, that the weeds may be kept down by cultivation, and thinning may begin when the leaves are an inch wide, taking the larger plants of course. For Spring and Summer use the variety known as Long Standing is the most desirable, as it continues growing much longer than other varieties before the seed stalks appear, which render it unfit for use. The Long Standing Prickly is also desirable on this account, and is a heavy cropper. The Savoy Leaved, Broad Flanders, Victoria and Prickly Winter are all valuable Winter sorts. As a money crop, spinach is very satisfactory, and is also useful as a cover crop.

EXHIBITION VEGETABLES.—As the fair season is now at hand, some hints as to the preparation of fruits and vegetables for exhibition purposes will be timely. But first a few words preliminary; the township, local and county fairs ought to receive the hearty coöperation of every farmer and gardener, and it should be the aim of every family to be in attendance and to be further represented by the very best possible exhibit in some one or more lines. Township and even street fairs are growing much in favor, and are found by their patrons to be the very best means of encouraging higher standards of excellence in every line of agricultural and horticultural industry. Last Fall it was the privilege of myself and family to visit a township fair located several miles from anything that could even be called a village; simply a thickly settled farming district along one of the principal thoroughfares leading out from the city. The history of this fair is only what may be developed in almost any locality, with very beneficial and lasting results. The county and State fairs can at best, only be patronized by comparatively few people. The local fairs can and ought to be patronized by the masses, old and young; and if there is a more effective means of encouraging the boys and girls to stay on the farm and of arousing their ambitions to excel in agriculture and horticultural pursuits, I have yet to learn it.

Briefly, the history of this fair is that a few years ago some of the farmers decided to have an exhibition in a small way, and an upstairs hall in the hotel was secured for the purpose. So much interest was aroused that for the following two years a large two-story building was found inadequate, and subsequently grounds of 15 or 20 acres were leased on which permanent buildings were erected, and arrangements made for an abundant water supply. Last year the exhibits were fuller in nearly every department than at the county fair of one of our leading counties a few miles distant. In the poultry department, of which I chanced to be one of the judges, the leading exhibitors and those carrying away most of the prizes were boys under 17 years of age. Thus as a means of polishing up the wits of the older members of a community, as well as developing and encouraging the best efforts of the rising generation, these local organizations cannot be too strongly urged. With an interest in the work, and a determination if possible to be an attendant upon the fair and make some personal showing, then comes the question, the display.

PREPARING EXHIBITS.—Many otherwise creditable entries are spoiled by the miscellaneous collection of boxes and baskets in which they are displayed. Packages for the various classes should be uniform in size, bright and new. Fruits are usually exhibited on plates, and great care in handling is necessary. Grapes and plums ought always to be handled by the stems and never by the clusters or fruits, as this destroys the natural bloom. Peaches should be carefully picked, and when laid on the plates an occasional stem with two or three bright green leaves will add much to the appearance. Thoroughly polish apples and pears with a dry cloth, and the improvement thus made will be surprising. Tomatoes should also be carefully polished, and exhibited only in shallow baskets. Potatoes and the root crops ought never to be washed; but should be carefully dried without exposure to too much sunlight, and then polished with a soft brush. Washing gives a sickly faded appearance that can never be remedied. Beans are nicely displayed by pulling up the stalks and tying in neat bunches, with the same varieties shelled in quart berry boxes. Corn will appear to best advantage if the best hills are pulled up by the roots and hung or stood up, also the same varieties should be shown husked and in baskets, with some ears broken that the depth of the kernel and size of cob may be easily determined. Cabbage and cauliflower are nicely trimmed up as for market, and grouped in half-dozen or dozen lots. The vine products, also eggplants and peppers, should be nicely polished, and stems left intact; these are also grouped in convenient lots, peppers excepted, which should be shown in baskets. Celery may be prepared by bleaching each plant separately, using pasteboard or tarred paper strips tied around the plant with cord or strips of cloth. When pulled wash the roots clean, but not the stalks, and pack the plants in upright position, half-dozen in a box. Use wet moss and pack the roots firmly, so that the plants will stand erect.

Canned goods, pickles, jellies and preserves, whether of fruits or vegetables, should, whenever possible to do so, be cooked in the cans to preserve the color and form as perfect as possible. The jars should be of the best and clearest glass, with new tops and rubbers. Arrange them on the display stand with an eye to the color scheme. Attention to these little details will count many points in their favor. It goes without saying that no blemished specimens of any variety should ever be allowed to creep in, and the generous strife should always be for every exhibitor to make the best possible display, and carry away just as many prizes as possible. It is interesting to note that some of the leading seedsmen offer liberal prizes to exhibitors who take premiums on vegetables grown from their seeds; but while too late for those who have not already done so to arrange with the seedsmen for this year, it is best to have it well in mind for next year's work. Thorough organization along these lines is well worth a trial, and I would be glad to see the day when the boys and girls, as well as the parents, in every school district, would have its organization in full running order. J. E. MORSE.

Plums for Kentucky.

J. W. M'D., Warsaw, Ky.—I wish to plant, say 10 native plum trees, for family use, making preserves, plum butter, canning, etc. What varieties that will pollinate each other would you recommend as the most desirable?

ANS.—The following varieties are likely to succeed in Kentucky. They should be planted about 15 feet apart, and be grouped together as much as possible to secure pollination: Wild Goose, Munson, Newman, Milton, Wyant, De Soto, Surprise, Miner, Golden Beauty and Wayland.

An Old Cellar for Cabbage.

E., Ontario Co., N. Y.—I have an outdoor cellar I have used for storing potatoes; it is 50 feet long, 14 feet wide, six feet deep; posts and boards at the side instead of wall, door in each end, ventilator every 10 feet, perfectly dry. Would that be suitable for storing cabbage?

ANS.—We can see no reason why this cellar would not make a good cabbage house. The only trouble that could occur would be neglecting to keep the cellar well aired. You must be very careful about that.

Peaches, Raspberries and Blackberries.

D. M. J., Seaford, Del.—1. I am selling peach trees through my neighborhood and wish to give honest service. Let me have your opinion of the following varieties of fruits: Fitzgerald, Bishop, Matthew, Waddell, Sneed, Connett, Willett and Carman peaches. State those that rot the worst. 2. Can you give me any pointers on the Strawberry raspberry Early King blackberry and King red raspberry?

ANS.—1. The Bishop, Matthew, Waddell, Sneed, Connett, Willett and Carman are all peaches that ripen in the early part of the peach season, and some of them are very early, especially the Sneed. None of them is poor in quality, and all of them are worthy of thorough trial, to say the least. I would not advise anyone to plant largely of any of these varieties at the present time, although I really know nothing serious against any of them, unless it is that Bishop and Connett are more likely to rot than any of the others. Fitzgerald is a variety that ripens about mid-season, and is good in quality and generally liked wherever it has been grown. 2. The so-called Strawberry raspberry is a novelty that is of no value except as a curiosity, and it sometimes becomes a nuisance because of the persistency with which it sprouts, and the difficulty of killing all of the underground stems. It is a species of the raspberry family found in Asia, that grows about a foot high and dies down every Winter. The fruit is quite large and very handsome, brilliant red, but has an insipid, almost tasteless flavor. The Early King blackberry is a high quality variety, moderately hardy, and quite productive. It is considered too soft for market. It is of a medium size, and a week or 10 days earlier than Snyder. It makes a small, erect bush. The King raspberry is a red variety, showing traces of European parentage. It is a good berry of medium size and fair quality, light crimson in color. It was sent out by a Virginia nursery in 1892. H. E. V. D.

BASKETS!
The Robison Basket Co., Painesville, O., the largest manufacturers in the U. S. of grape, peach and fruit packages. Write us for samples and prices.

GRAPE VINES
Currants, Gooseberries, Blackberries, Raspberries, Strawberries. Price List FREE.
Send 2c stamp for illustrated descriptive catalog.
T. S. HUBBARD CO. Fredonia, N. Y.

BULBS For 25 cents **BULBS**
we will send you, postpaid, the 25 bulbs named below:
3 **Roman Hyacinths**, white, rose, blue.
6 **Mixed Tulips**, extra-fine mixture.
3 **Narcissus**, all different.
10 **Crocus** mixed colors, mammoth bulbs & flowers
3 **Freesias**, large bulbs, white flowers.
These are all good sound strong bulbs. Our Fall catalogue of Trees, Plants and Bulbs free with every order. Order now to secure this offer. Send us name and address of friends who may need trees, seeds, plants or bulbs with your order, and we will put in some extras that will please you.
T. C. FURNAS & CO., Sheridan, Ind.

Winter Onion Sets.—$2 per bushel. If set out this month will give fine crop for bunch onions next Spring.
REV. C. F. BLAKEMAN, Sandy Hill, N. Y.

CLOVER SEED—Choice, clean Crimson or Scarlet of my own raising, $4 per bu.; sacks free. J. C. ELLIS, Millsboro, Del.

SEED WHEAT—Fultz Mediterranean; very hardy. Heavy yielder. 40 bushels per acre, thrashers' measure. Clean seed, 90 cents per bushel. I. H. PERKINS, Dover, Del.

DAWSON'S GOLDEN CHAFF WHEAT is a variety which originated in Canada. After being tested by the Ontario Agricultural College, also the Michigan Agricultural Experiment Station, it has never shown any trace of the Hessian fly, while adjoining fields were ruined. It is very hardy, a big yielder, heads compact, squarely built and well filled, red chaff and light amber grain. Will yield from 30 to 40 bushels under ordinary circumstances. Price, $1.25 per bushel. We also have the Mammoth White Winter Rye, very hardy, and a big yielder. $1 per bu. Black Winter Rye, 75c. per bu. Ask for prices on Timothy and Clover Seeds.
HARVEY SEED CO., Buffalo, N. Y.

TREES AND PLANTS—Free from Scale. New and Choice Varieties Blackberries, Strawberries, Raspberries.
Our FREE CATALOGUE will save you money. MYER & SON, Bridgeville, Del.

TREES $8 PER 100—APPLE, PEAR and PLUM, 3 to 5 feet high. HEALTHY and TRUE TO NAME. Best varieties. We sell all kinds of trees and plants at lowest **Wholesale** prices. **Don't** buy until you get our Catalogue, which is free, or send list of wants for **special** price. Address RELIANCE NURSERY, Box 10, Geneva, N. Y.

THE STORRS & HARRISON CO., PAINSVILLE, OHIO.
Leading American Nurserymens offer one of the Most Complete Assortments of
FRUIT AND ORNAMENTAL TREES, SHRUBS, ROSES, BULBS, ETC.
48 Years. 44 Greenhouses. 1000 Acres. Correspondence Solicited. Catalog Free.

BULBS FOR FALL PLANTING Hyacinths, Tulips, Crocus, Narcissus, Lilies, etc. OUR NEW BULB CATALOGUE is sent free. It tells all about the best bulbs, also seasonable seeds and plants, including our celebrated grass mixtures for the lawn and pleasure ground. **HENRY A. DREER, Philadelphia, Pa.**

Are You in Doubt WHAT TO BUY OR WHERE TO BUY IT? Are you looking for a safe place to buy your trees? Would you like to find one catalogue that tells the truth about varieties? Do you want *safe* trees—*fumigated* trees; trees that when you read the label and plant the tree you know just what the fruit will be? Then **ROGERS' TREES** are the trees you want. They are the *safest trees*, the *best trees*—famous as the hills on which they grow. If there is anything else you would like to know, just drop a line to
IF IT'S A ROGERS' TREE IT'S A SAFE TREE.
ROGERS ON THE HILL, DANSVILLE, N. Y.

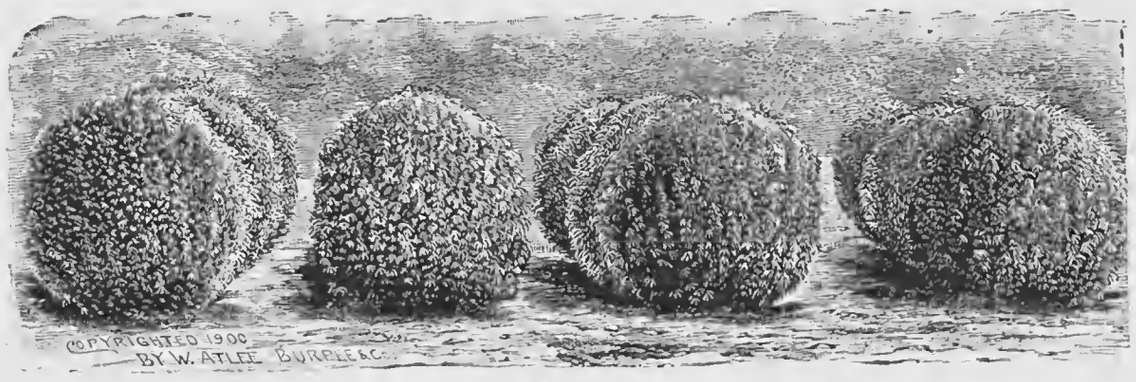
Why Not Add to the Certainty of Growing a Good Crop of Winter Wheat by Sowing Our "Turkish Red"
THAT always produces a good crop wherever Winter wheat can be grown? It is iron-clad and the hardiest wheat in existence; has proven of strongest vitality, given the biggest yield and best wheat in the world at every Experimental Station where tried. It has a record of 55 bushels at Iowa Experiment Station, and an average yield of 45 bushels for the past 10 years. Hundreds of farmers grew from 10 to 20 bushels more per acre this year from our seed than from best common sorts. Price, $1 per bushel, bags free, f. o. b. here. Write for **Free Catalogue** and descriptive circulars. New crop choice home-grown Timothy seed, $2.50 per bushel, sacks free. Address, mentioning The Rural New-Yorker,
J. R. RATEKIN & SON, SHENANDOAH, IOWA.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

THE MOCK OR SUMMER CYPRESS.—Fig. 281, from the seed catalogue of W. Atlee Burpee & Co., Philadelphia, Pa., though rather formal, does poor justice to the symmetrical outlines of Kochia scoparia or Summer cypress when naturally grown in the garden. Although this plant has been known for the greater part of a century, it is so seldom grown in this country that it excites the utmost interest when seen. Little plants started indoors in April and set out in ordinary soil in May, two feet or more apart, make symmetrical bushes nearly three feet high, much resembling a carefully sheared evergreen, by September. Soon after the branches are covered with a crimson or coral-red inflorescence, which entirely changes the aspect of the plants. The flowers are very small in size, but countless in number, crusting every twig. The plant dies soon after having ripened its innumerable seeds. A dozen Kochias were used in a clump to fill up space in an unfinished shrub bed on the Rural Grounds for the Summer, and visitors all inquire what rare evergreen has been established there. The genus Kochia belongs to the Chenopodiaceæ, or Goosefoot family, which includes the cultivated beet. The 30 or more species of Kochia differ much in appearance, and none is of horticultural interest except K. scoparia, the species under consideration, which is native to northern Asia and some parts of Europe. The foliage is long and narrow, pleasing light-green in color, with a silky texture. The regular conical form is developed very early, and maintained until maturity. It so closely resembles a well-known dwarf Retinospora, except in the lighter green tint, that many persons can scarcely be convinced it is grown from seed in a few weeks' time. Kochia seeds germinate quickly and the plants are easily handled. It is said to thrive best in clay soils, and to appreciate a sprinkling of saltpeter, or even table salt, on the ground about the plants. We have seen it growing with apparently equal vigor in light sand, loam, and clay, and would consider it an easy and desirable plant for occasional trial, if not regular cultivation in the way of foliage beds, groups and Summer hedges. It is said to be grown in Europe more for its short-lived brilliancy at the flowering period than for its trim greenness during early growth.

MORE SCALE TALK.—A subject that will not down is the persistent spread of the Pernicious or San José scale. Although introduced near the Rural Grounds over 10 years ago, and pretty well disseminated throughout this corner of New Jersey, little damage has hitherto been noticed on large bearing trees, though many young orchard and ornamental trees have been killed. The present season, however, witnesses the practical destruction of some previously vigorous apples, at least 30 years old; situated at some distance. The writer first noticed scales on these trees in 1899. They were few in number, scattered over the new growth, and looked as though they had a difficult task to conquer their large and lusty hosts. Last year gray crusts over the lower branches showed that the pests had increased to millions; the leaves on infested limbs dropped early, and the fruit came to nothing, being shriveled and dotted with scales. This Summer reveals still more painful evidence of their deadly work. Half the branches are bare and dead, dying from below upwards; no fruit was set, and the trees have the discouraged look that precedes dissolution. Pernicious scales are found at times on such ornamental trees as willows, Mountain ash, and Osage orange, but are not observed on many other smooth-barked trees where they might be expected. The result of two years' trials of crude petroleum on the Rural Grounds may be summed up in destruction of scales and immunity from reinfection for one season in 11 young fruit trees; reappearance of scale in midsummer after spraying with crude oil in March, one tree. Destruction and immunity for two successive years with one spraying, eight successes and one failure, the scales appearing the second Summer, though apparently free the first year. The failure to clear out scales the first season was in a good-sized Satsuma plum tree, headed back to get rid of small branches. The tree was sprayed carefully late in March, but damp and foggy weather evidently prevented the oil from sticking, and the June brood spread over the unprotected areas, but has not gained a foothold on the greasy surfaces. Records of similar experiences come from many sources, and the serious nature of the pest is being strongly impressed on all tree growers. A continuous battle is in prospect, and the price of tree fruits in the near future, like liberty, will be eternal vigilance. The difficulty of thoroughly spraying large trees is at once evident on trial, and the final outcome, unless totally new methods of relief are discovered, is likely to be a demand for low-growing and early-bearing varieties. While good quality and prolific bearing will continue as essential as in the past, the search will be for trees that promise quick returns and occupy small space. Every fruit tree planted will demand constant attention, and possibly occasional expensive treatment with spray or gas fumigation. Long-winded and rampant growing varieties will be discarded for the precocious and compact kinds plant breeders are expected to create. The time is past, if it ever existed, to hope for the extermination of this minute and destructive scale, and the problem of protecting our individual choice trees and shrubs now faces every gardener.



THE MOCK OR SUMMER CYPRESS. FIG. 281.

BURBANK'S ELEGANCE VERBENA.—Plants of Luther Burbank's new sweet-scented Verbena Elegance were forwarded for trial early last Spring, and planted in congenial light soil in the Rural Grounds. Like most propagated Verbena plants, they started off rather slowly, but are now blooming profusely, making very neat and compact plants. The clusters are about three inches across; the individual flowers of the largest size. The type of coloration is new and very distinct. A clear white center covers more than half the plant, with outer shadings of light lavender purple. The fragrance is the usual Arbutus-like odor occasionally found in seedling Verbenas, chiefly in the light-colored varieties, but more strongly marked. It is more noticeable in the evening, diminishing considerably in strong sunlight. Mr. Burbank's first scented Verbena Mayflower has been disseminated about six years, and is now well known. It resembles in color and, of course, in fragrance the dainty Trailing arbutus, Epigæa repens, familiarly known as the Mayflower in the Eastern States.

AN OLDER BLUE DAISY.—Referring to Arctotis grandis, the newly discovered "blue daisy" noted on page 614, we omitted to mention the neat little Felicia ameiloides, formerly known as Agathea cœlestis. This Aster-like plant was introduced several years ago by a prominent seedsman as a blue daisy, or "Marguerite." It makes an elegant pot plant, and may be grown like a Cineraria, but is not adapted for the border. The preposterous name of Arctotis Stœchadifolia is now brought forward for A. grandis under the claim of priority, it having been overlooked by the highest botanical authorities. Whatever may be the justice of the claim, it is safe to predict that the gardening public will scarcely consent to use a name which must sound so much like an explosive sneeze. W. V. F.

MULCHING THE ORCHARD.—Grant G. Hitchings, of Onondaga Co., N. Y., has an original way of caring for his apple orchards. He told the writer about it at the annual meeting of the New York Fruit Growers' Association. A correspondent for a local paper recently gave the following description of Mr. Hitchings's plan:

"He sets young trees in grassy instead of cultivated fields, mulches with the mown grass, drawn straw, etc., and grows the trees slowly with low branches and very little trimming, and sprays thoroughly. When the young whip-like branches are loaded with apples, the tips rest on the grassy ground, the upper limbs rest on the lower ones and the tree has a pyramidal shape. The wind has very little effect, and the few apples that fell lay on or in the luxuriant grass. Those who have noticed a naturally grown Norway spruce covered with Winter snow or sleet without a broken limb can imagine an apple tree thus grown and loaded with fruit. At the Geneva Experimental Station the apple trees have horizontal or fastigiate branches and the orchards are carefully cultivated, while here in the backwoods of Onondaga an opposite, unorthodox course is taken with far more successful results."

THIS is the way the Mirror and Farmer puts it: "Prof. Frederick Starr, of the University of Chicago, one of those eminent gentlemen who earn salaries and achieve notoricty by discovering things that are not so and recommending what cannot be done, has made a bid for the gratitude of his fellow citizens of the western metropolis by informing their park commission that it can easily rid the city of mosquitoes by planting castor beans along its streets and walks and in its squares, and that any other place on the map can do the same." We may hear next that a steady diet of baked beans will make one immune to mosquito bites.

HOPE FARM NOTES

GIVING ADVICE.—Among the letters recently received is one containing the following:

You are constantly advising others how to manage a farm with apparently good advice, and at the same time recording your failures with apologies and excuses that don't excuse. You approve the Clark grass method—you tried it—you did not get Mr. Clark's result. Reason, your fields are not adapted to the method, or something similar. You should have known this before trial was made. Again, you say "There is more work on the farm than can properly be done"—surely a condition resulting from bad management. Write up one crop that you have ever been successful with, i. e., that paid for its cost and showed a profit, and I am sure all your mistakes will be forgiven. H. H.

Now this gentleman may have seen a farm from the windows of a railroad train, or perhaps he has read some of the articles written by men who farm on paper. It is true that several years ago I was so full of advice that a good deal of it ran over and hit others a hard whack. Since then I am frank to say that I have tested some of these bits of easy advice with sweat-stained dollars—and they have shrunk! Which? Why, both dollars and advice. That is why I give a fair report of many of our failures. All farmers make mistakes, and all fail with some crop at one time or another. Some farmers take the records of such failures out in the back yard and bury them—then they put a monument over the grave with "Success" written on it. As a rule, the dead do not come back to dispute their epitaph. We don't try that at Hope Farm, for we don't pretend to be model farmers.

SOME FAILURES.—Yes, I certainly do approve the "Clark" grass culture. Correct—we did not raise as much grass as Mr. Clark does, yet I am quite satisfied that we cut the heaviest crop of grass that ever was taken from the fields where we tried it. Ought to have known we couldn't do it? I am not a prophet or a mind reader. As we have two fields well stocked with grass and good for some years I am not going to complain. I think our trials have made clear the chief point about Mr. Clark's method—you must have certain conditions of soil and location just right before you can hope to raise grass. You can't any more raise "Clark" grass on a rocky hillside than you can make perfect music on a piano with half the strings out of tune. That is no reason why one should keep the hillside in weeds or the piano shut tight. . . . . Yes, ever since June 1 we have had more work on the farm than could properly be done. The wet season is responsible for that. We had our plans laid with great care, but the constant rains have washed all the stiffness out of them. Our friend seems to have an idea that drenching rains on a heavy soil will kill weeds and make the cultivator work easier. It would do me lots of good to see this man take the mud out of our cornfield, the blight out of the potatoes and Lima beans or make the sweet corn ear and the tomatoes and melons ripen by "good management." My experience is that sunshine is needed for these things, but it appears that I am wrong.

CROPS THAT PAY.—My apple crop has paid a good profit. The early orchard has given a good crop of oats, nearly $115 worth of apples, and now has a heavy seeding of clover and Orchard grass. I do not believe that the apples from that orchard averaged $20 a year for the 10 years before we started to brace it up. Our pig department has paid well. I have paid less than $40 for purebred stock—the rest are grades raised very cheaply on refuse and a little grain. We have sold nearly $50 worth of pigs, besides eating $25 worth more, and if a man were to offer me $125 for the stock now on hand I should laugh—not at him but at his offer! The cost of raising these pigs is light, because we feed quantities of refuse that are not salable until they are made into pork. In the last five years we have made a good profit on two crops of potatoes, and come out about even on two more. This year's crop is as yet a mystery. I first expected a big crop, though luckily I didn't plan to buy a new carriage on the strength of it. I judged the crop by the tops. When I began to dig we concluded that there would be no crop at all, and we began to take better care of the strawberries in the hope of making it up next year. Now the chances are for a fair crop after all, and the high prices may make a profit. Every good farmer knows that farming is not a business to be judged by any single year, but rather by a series of years. Take a crop of wheat. The Hessian fly may ruin it so that the grain will not pay for the fertilizer, to say nothing of labor and rent of land. Yet that crop may not be a failure, because the clover may be so fine that it will show results in half a dozen following crops. I am starting a peach orchard on the Stringfellow plan. It has cost me some little money, and won't pay a dollar for two years anyway. It may prove a failure after all, but even if I never get a cent out of it I believe it will teach lessons that will be mighty profitable. My farm is an old one, and it takes longer to make such tough old soil yield a profit than it does to make an old dog forget his bad tricks.

FARM NOTES.—I have to think of J. Whitcomb Riley's lines:

An' all the corn that's wallered down
Will elbow up again.

We had rain after rain and cloud after cloud until the fodder corn first went down on its knees and there rolled over on its back. Why, it was so thin and bloodless that the cows wouldn't eat it. Then all of a sudden the sun pulled off its coat, jumped into the northwest and booted those miserable clouds right and left. It left them so weak that they gave us a week of bright sunshine. It was good to watch that corn. After one sunny day a few stalks started up here and there in a half-hearted way. They seemed to say: "We have been fooled a good many times this Summer, Mr. Sun. If you mean business this time, say so, and we'll try again. If you are not man enough to hold the fort—we'll stay down." The sun assured them in some way that he meant business, and they "elbowed up" with a will. Some of the corn planted on July 6 is already making tassels. The week's sunshine seems to have saved our main crop of corn. As we all know, this was planted very late, but it is earing well, and the chances are now good for more grain per acre than we had last year. . . . . The second cutting of grass will be a good one. On these two "Clark" grass fields the Red-top made a great showing at first, and I feared for the Timothy. In this second growth the Timothy seems to have come with a rush, while the Red-top is taking a vacation. We are now only waiting for the promise of two or three sunny days to cut all the late grass. . . . . We have a little handicap this Fall in the shape of a sore horse. Old Frank has not been well for some time, and now his shoulder is sore. This has been a hard season for the farm team on a heavy and hilly farm. They would stand still for days in a rainy time, and then be forced to violent exertion when a few days or hours of sunshine came. It is like a leak in the engine boiler when old Frank flinches at the plow.

POTATOES.—At one time I about concluded that if our six acres gave us enough to feed our big family, with a few little ones left for the pigs, I wouldn't complain—at least publicly! The tops were all right—but what's the value of a top that has no bottom to it? But the potatoes, like the corn, "elbowed up" in some way, and at least two fields are doing well. One is the place where we put the mixture of equal parts of nitrate of soda and sulphate of potash around the hills early in July. These hills took on new life. I notice that they kept green and strong, while others beside them died. They are still growing, and the tubers are large and shapely. That fertilizer will pay well this year, yet I cannot lay it down as a settled rule that such late fertilizing will always pay. The other promising potatoes are in that low, wet field, where we put most of our stable manure. No use talking, I must admit that, up to date, those manured potatoes are the best on the farm. At one time one could hardly see the potato vines for the weeds, but we have finally cleaned those weeds out, and find the vines green and thrifty, and what is better, a big bunch of tubers hanging to every Carman plant. Remember that I say these potatoes *promise* well. Wait until they are dug!

MONEY WITH "FUR" ON IT.—The following note has given me quite a little thought. It is from a Connecticut man who told us of some of the wonderful profits in growing tobacco under shade:

Now, while the Hope Farm man refuses a cigar, I do not think he would refuse the money a 10-acre field of tobacco would bring, nor do I believe he would object to growing it if Hope Farm were located in the Connecticut Valley tobacco district.

D. K.

Now, that is a tough one, but I have thought it out with some care. If our friend will offer me the money made in 10 acres of tobacco I will gladly take it, but not one cent would be spent on my family or myself. I would give every dollar of it to some place where true charity is practiced, or true education is attempted, and give it right off. I am told that in Connecticut the Legislature passes a law to prevent the sale of cigarettes, and then turns around and provides money to boom tobacco growing! No, I would not raise tobacco unless I was to use it for killing insects! If any man thinks to kill the Hope Farm mortgage with nicotine we thank him for his good intention, but would rather have the mortgage keep on eating than to have it wiped out by money from the sale of either rum or tobacco. The Madame and the Bud, who are joint owners in the property, will back me up in this. What a crank that fellow is!—you will say. Very likely—I was made a crank by seeing alcohol and nicotine turn the crank that ground honor, health, respectability and manhood out of some good friends of mine!

H. W. C.

Tent Cure for Consumption.

The following statement from the Boston Transcript will interest many people who are studying the dread disease:

"As soon as the weather will permit and proper locations can be selected there will be pitched near Boston the first of a number of camps for consumptives. This camp (and each succeeding camp will be like it) will consist of 10 piano-box tents, arranged in a circle with an open-air fire in the center, and surrounded by a duck wall eight feet high. Each of these tents will be a consumptive's home; a consumptive will sleep there, even through the coldest weather, with no other protection than plenty of felt blankets, felt sleeping boots, and a two-gallon jug of hot water. The tents are made of 12-ounce duck, are only seven feet high, with four-foot walls, boxed in around the bottom a foot from the ground. They will be lined with weather paper. The flaps will open towards the fire, the 10 tents making a little circle about a clean gravel court. In the duck wall which will surround the whole will be a single entrance. The people who live there will wear one heavy suit night and day. They will each of them take one quick soapless bath a week, and will eat three good hearty meals a day, with coffee in the morning and hot chocolate any time of the day or night. Their bill of fare will include milk, eggs, vegetables, bread and butter and meat—chiefly beef, mutton or pork, broiled on spits before the fire, or roasted in the embers, or boiled down into soup. This open life is expected to cure them of their disease. The method is the result of experiments made last Winter in a tent by a scientist whose name has not yet been divulged. This man pitched his tent during the coldest part of a January which was more than usually cold, and stayed in there until the early Spring, engrossed in his experiments, but finally seeing patients and announcing that he wanted as many consumptives as possible to prove the truth of his theories."

"A Field of Grain
taller than the fence"
results from the use of fertilizers containing a high per cent. of
Potash
Every farmer can know what fertilizer to use with greatest profit and economy, by writing for our *free* books.
GERMAN KALI WORKS,

JOHN J. DILLON, Business Manager.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.

Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, SEPTEMBER 14, 1901.

CUT away the trees, shrubs and vines from around the well-arranged country home, and you will cut a big slice from the selling price. Add such things to the treeless home and you make it worth more, and also easier of sale. Why should the farmer scorn such things when they have a direct bearing on the selling value of his property?

*

WE hear many reports of the depreciation of farm property, but some of the "slumps" in other lines of business are seldom reported. Two mills in New England were recently sold at auction. One was appraised by experts in the Spring for $123,850.47—yet it brought only $41,250. Another, appraised at $57,692, brought only $21,650. Farming in some localities is hard work, but wouldn't you rather have your money in a comfortable farm than in such mill property?

*

THE statement by Assistant Secretary Brigham on page 626 puts the position of the Agricultural Department with great clearness. It is possible to develop a great market for our fruits in Europe. In order fully to meet the requirements of this market we must know how to pack, what to pack and how to ship. Our customers are many miles away—how can we best reach them? It will evidently cost money and time to find answers to these questions. In providing a new market for surplus agricultural products the Government benefits the entire country. We think the Secretary of Agriculture is clearly within his privileges when he guarantees shippers against loss in these experiments.

*

PROBABLY the largest cotton grower in the world is the State of Mississippi. This State operates 12 large farms, using the convicts as farm laborers. This work was begun in a small way as an experiment, but was so successful that now the yearly profit is said to be $150,000, and the State has purchased 12,000 acres of cotton land. It is now proposed to use the county convicts on smaller farms. Louisiana and Texas, it is said, have followed Mississippi with State convict farms, and other Gulf States are considering the matter. Should they all decide to adopt both State and county farms, an amount of cotton would be produced which would seriously affect the sale of the crop grown by small farmers. Thus far the amount of this State cotton has not been large enough to make competition with free labor serious—but it will be easy to overdo the matter.

*

THE other day a farmer volunteered this information: "The people in my neighborhood prefer THE R. N.-Y. to any other agricultural paper!" Of course we wanted to know why. His reasons are about as follows: "There are a dozen or more good agricultural papers in the country. They all have their strong points, and are well worth the price. The information they print is timely, but one can pick up this week's paper and tell pretty nearly what it contains by looking at the corresponding issue for last year! In other words, you know pretty well what to expect before the paper comes. On the other hand, THE R. N.-Y. always contains something new and original. You feel sure that every issue will contain a pleasant surprise. A tired farmer will find rest in its columns, and carry from its reading thoughts that will haunt him for many a day." We quote this answer here because it was evidently sincere, and seems to indicate that our plans are working out into definite results. It has never been our policy to disparage the work of our contemporaries. There is room for all who will work honestly and fearlessly for agriculture. Our ambition is to make THE R. N.-Y. so fresh, original and helpful that it will occupy a class by itself. During the past season our circulation has increased faster than ever before, and this increase has been largely due to the personal influence and work of our regular subscribers.

*

THE list of troubles and diseases that may be helped or cured by work is a long one. Let some genius establish a sanitarium in a healthful country place, provide manual labor of various kinds in field, shop and kitchen, study his patients, prescribe for each certain forms of work, and tactfully get them to follow out his instructions as well as they do those of the physician, and he could publish a startling list of cures. Without irreverence it may be said that a multitude of people can, if they will, work out their own salvation so far as health is concerned, though it is doubtful whether this work cure will ever become popular. Wholesome employment, that stirs up the blood and unused muscles, will remove the cause of many forms of nervousness, melancholy and other mental diseases, and make one forget for a time at least, homesickness and disappointments.

*

IT is becoming the custom with some farmers to raise chickens in the latter part of the Summer, or after haying. The reasons for this are somewhat as follows: One cannot get Winter laying pullets unless the chicks are *very* early. After the first few chicks of Spring are out, those hatched in July and August will lay about as early the following Spring as those hatched in the fore part of the Summer. The cost of raising from August on is not so great, and much of the time, from the middle of August till the first of November, is quite favorable for the growth of chickens. Besides this, there is, on most farms, more leisure time to look to the chicks after haying is over than during the rush of Spring work. Add to this the fact that the early hatches are more uncertain than those later in the season, and the case is, for many people, strongly in favor of Fall-raised chicks. It is also true that in some locations the Winter egg does not bring the most clear money. Eggs in late Summer cost less and bring nearly as much money.

*

ON September 1 a law went into effect in New York State prohibiting butchers from selling meat on Sunday. A great amount of business has been done in meat markets on Sunday morning, especially in the larger cities. Much of this buying is the result of thoughtlessness on the part of people who might as well have laid in their supplies Saturday night. There are some who have no conveniences for keeping meat over night in hot weather. This law may work hardship to them, but it is doubtful whether there is any great number of meat buyers in this class. The law is the result of a movement in the interest of the journeyman butcher, whose Sunday has heretofore been beheaded. Many butchers were not anxious to open their shops on Sunday, but felt that they must, or suffer severe loss of trade. Putting off until Sunday morning buying that could as well have been done Saturday night is practically robbing some one of rest to which he as a worker is entitled; and it would seem as though those who claim to have respect for the Sabbath, as well as a reasonable regard for the rights of others, should not add to the present burden of unnecessary Sunday trade.

*

WE receive a good many lively letters about the bulletins issued by the experiment stations. A fair summary of this correspondence indicates that the majority of farmers, including many of the more prosperous, are not able to understand most of these bulletins except after hard study. Among the various opinions brought out in this discussion is the following:

In your issue of July 27, page 515, S. R. Walker says: "I do not think that the bulletins should be made so plain that any farmer could read and understand them as readily as he could a daily paper—if he could he would forget their contents just as soon." If his theory is correct I would suggest that our experiment station bulletins could be improved if written in blank verse like Milton's Paradise Lost. J. W. S.

There may be poets budding out at the experiment stations who can give us a stirring poem on the slaughter of bad bacteria or the benevolent murder of Potato beetles by some of their parasites. We doubt, however, if their poetry will ever be committed to memory or declaimed at school exhibitions. The fact of the matter seems to be that one sort of a man is required to dig out and develop a scientific fact, and quite a different one to present that fact so that the common people can grasp it. The world has known some men who were able to do both kinds of work, but as a rule the scientist who gets nearest to Z appears to forget the time when he did not know A.

AND now we are to have another great fair—at St. Louis in 1903 to commemorate the great "Louisiana Purchase." It would seem as though the public is being treated to rather more than its fair share of fairs, but this one will be probably the greatest agricultural exhibit ever known. Among other things it is designed to have living exhibits of vines and trees. For example, a complete exhibit of all well-known varieties of American grapes will be planted in the Spring of 1902, so as to have them in actual bearing during the Exposition. Other trees and vines will be grown and exhibited in the same way. This will, we feel sure, prove an attractive display. We have urged the managers of the New York State Fair to have fields of potatoes and corn planted on or near the Fair grounds and encourage trials of farm implements in actual field work. That ought to make one of the best displays at the Fair.

*

RECENT experiments in Europe and Cuba demonstrate beyond all reasonable doubt that mosquitoes carry and transmit the virus of yellow fever and malaria. Persons in normal health, shielded from exposure to these diseases, have permitted themselves to be bitten by mosquitoes previously allowed to bite patients suffering from these particular diseases, and in almost every instance typical symptoms quickly followed, ending in several yellow fever cases, with the death of persons bitten. The vast benefits to humanity to be gained by fixing the chief source of transmission of these dangerous maladies tax the imagination. When we have located the enemy the problem of limiting his efforts becomes much simplified, but what can be said of the heroism of those who take upon themselves such terrible personal risks, with no hope of adequate compensation should they survive? It is evident that true courage is not confined to boastful rough riders, but is rather to be met with in the more obscure walks of life. Some of the subjects of the recent yellow-fever experiments wished to become immune by experiencing an attack under the best medical care, so that they might devote their future to nursing those afflicted with the dread scourge, but all were said to be impressed with the possible benefits to humanity and science arising from their ordeal. All honor to such unselfish men and women.

*

BREVITIES.

HE is surest of his laugh who laughs first.

NO, people who are set in their ways seldom hatch out new ideas.

THERE is an unnatural demand for "natural" fruit this year. It can all be sold.

PLENTY of farmers have been obliged to "hoe potatoes with a sickle" this year.

LAST year Americans exported 32,069,371 pounds of clover seed, nearly half going to Germany.

A REPORT from Kansas: "The Ruby Queen died, like most everything else in Kansas this year."

WE do not believe that there is any danger in cutting the hemp twine bands on machine-bound corn into the silo.

THE demand for corn fodder is so great in the West this year that we understand even the sled corn cutters are about all sold.

THE average yearly exports of potatoes for the past five years were 809,472 bushels. This was only about two per cent of the total.

REPORTS of attempts to "corner" the apple crop come from various sections. No question but that buyers are hard at work getting all the fruit they can.

WE have fodder corn which has so little quality in consequence of lack of sun that the cows will hardly eat it. They must certainly call it "green goods."

WHAT a flood of turnip seed has been sown this year for manurial purposes. It is going into many orchards and cornfields—much of it mixed with Crimson clover.

ONE of our readers who has just been through the Province of Quebec says he saw at one place a shipment of a dozen new spinning wheels, such as our grandmothers used to turn!

AN English orator was endeavoring to paint the troubles which at times confront the dairy farmer. He told of a farmer who had 50 cows to milk. "It was a case of all hands to the pumps!" said the orator.

THE newspapers report that the Colorado Potato beetle has finally appeared in England. If it spread to Germany and France as rapidly as it did in this country the food supply of Europe will be upset for several years.

MOSQUITOES have carried many disease germs and pricked them in, but another germ may be their undoing. A scientist is now searching for a disease germ which will end the mosquito problem. This germ is to be used on live mosquitoes, which will be set free and sent abroad to spread the disease among their fellows. Let us hope our scientific friend will succeed in his search.

THIS is the way one friend puts it: "The talk on smoking reminded me so forcibly what an influence the devil in our natures will wield over us if we stop to parley with him. Intellectual arguments are all right when only intellectual things are at issue, but when there is a question of right or wrong there should never be any compromise, or even consideration, by the man whose highest aim is to be right though the heavens fall."

Events of the Week

ATTACK ON PRESIDENT.—September 6 an attempt was made to assassinate President McKinley while at the Pan-American Exposition. He was holding a public reception, the assassin while apparently preparing to shake hands with him, firing two shots from a concealed weapon, one bullet penetrating the stomach, and causing a serious, though not necessarily fatal wound. The criminal is a Pole, giving the names of Czegolz or Nieman. He asserts that he is an anarchist, but members of the anarchist party disclaim his assertions.

DOMESTIC.—A boiler explosion wrecked the steamer City of Trenton on the Delaware River below Philadelphia August 28, killing 29 persons and injuring many others. The victims were horribly injured. . . . . A dynamite explosion in a coal mine at Shamokin, Pa., August 29, shockingly mangled eight men, two fatally. . . . . State Treasurer J. R. Stowers, of Mississippi, was suspended by Gov. Longino August 28. Mr. Stowers had admitted that $107,000, missing and unaccounted for when the Governor counted the cash August 15, had been deposited in banks, which is forbidden by law. The Jackson banks denied having any of the money on deposit, and Mr. Stowers' explanation of its whereabouts was not satisfactory to the Governor. . . . . During a terrific storm at Altoona, Pa., August 31, while a golf tournament was in progress, one person was killed, seven were rendered unconscious, and 200 spectators were more or less seriously shocked by three successive bolts of lightning. . . . . An appeal to President McKinley for protection for the negroes who are being lynched for their crimes was formulated and indorsed by the negro territorial Baptist Sunday school convention, in session in Oklahoma City, O. T., August 30. The convention does not attempt to excuse offenses, but asks the President to use his executive power in securing for them a fair trial in the courts before punishment is meted out. . . . . A rainstorm that prevailed September 1 in Cleveland, O., wrought havoc all over the city. Houses were wrecked, and only heroic work prevented heavy loss of life. Trains were delayed by washouts, and street car traffic on many lines was at a standstill. The river was a raging torrent. The property loss is estimated at $1,000,000. . . . . A railway collision at Newark, N. Y., August 31, killed 16 persons. . . . . At Kalispell, Mont., August 31, 18 freight cars broke loose and rushed down a mountain, crashing into a passenger train. A terrific wreck resulted, the cars taking fire; 41 persons were killed. . . . . The revenue cutter Rush has returned to Sitka from Yakutat, 200 miles westward, where it went to quell serious Indian troubles, which have caused great alarm among the whites. Governor Brady addressed the Indians, warning them to obey the laws and refrain from disorders. They also were ordered to stop polygamy. Nearly 200 were vaccinated by the surgeon of the Rush. . . . . The seventh week of the great steel strike shows no actual change in the situation. Except in a few scattered cases the strike has been noticeable for its quiet and orderly character. The most serious blow the men have received is the refusal of J. P. Morgan to make contracts directly with a labor organization unless it is an incorporated body.

ADMINISTRATION.—Mr. Tracewell, the Comptroller of the Treasury, has rendered a decision which disposes of the famous De Lima case. He holds that under the recent decision of the United States Supreme Court the judgment obtained by De Lima & Co. for $14,597 from the United States on account of duties paid by them on goods shipped from Porto Rico to the United States, between the date of the ratification of the Treaty of Paris and that of the approval of the Foraker act, may be paid out of the general appropriation of the Treasury Department, without further action by Congress. . . . . The President has appointed Wm. H. Hunt, of Montana, Secretary of Porto Rico, to be Governor of the Island, vice Allen, resigned.

HAWAIIAN ISLANDS.—The members of the Bar Association of the Islands ask for the removal of Abram S. Humphreys, judge of the circuit court of the First Judicial Circuit Territory. They charge that Judge Humphreys controls and is actively engaged in the publication of a partisan newspaper while exercising the powers and performing the duties of circuit judge; that he takes an active part in bitter political controversies; that he uses his powers as judge to promote his own personal and political ends; that he is harsh, arbitrary, tyrannical and vindictive towards members of the bar and others, and that he has held in disregard the obligations devolving upon him as judge, and has brought the same into public disrepute and under suspicion. Judge Humphreys denies the charges, and the matter is under investigation.

FARM AND GARDEN.—Plow manufacturers of the United States have decided upon an advance of 10 per cent in the price of plows during the coming year. They claim that the cost of production is much greater than it was a year ago.

The county fair at Brandywine Springs, Del., opened August 28. Addresses were made by Aaron Jones, of South Bend, Ind., Master of the National Grange, and R. H. Daly, Master of the State Grange. The largest prize winner was J. Edward Addicks, receiving 17 on his exhibit of swine, vegetables and horses. The next largest prize winner was Arnold Naudain, who received 10 awards on cattle.

Prof. Leroy Anderson, late of Cornell Agricultural College, is now instructor in dairy husbandry at the University of California, Berkeley. The special course in dairy work is attracting students from all parts of that State.

The Wolverine Sugar Company, at Benton Harbor, Mich., failed August 28, the announcement being made August 31. Legal proceedings already have been begun to protect the holders of outstanding notes to the amount of $107,700 and the Chicago Trust Company, which holds $125,000 of the company's bonds. Local fields during the last two years have not raised enough beets to run the factory, and the managers had contracted for the product from 4,000 acres near Shelby, Ind., for this season. The factory cost $320,000.

A meeting of the Gloucester County (N. J.) Board of Agriculture was held at Mullica Hill, N. J., September 3. The question of "Needed Legislation for the Good of Agriculture and How to Procure the Same" brought out the views of the farmers. William H. Hoffman said legislation that would regulate sending produce to market might be a good thing. He didn't believe it was good policy to send truck to market that some farmers wouldn't feed to hogs. In the matter of legislation, Thomas Borton thought the farmer was not fairly represented. "Farmers," he said, "should agree among themselves, organize and stay organized, and work as a unit." He said it lies with the farmer to correct politics, and what interests a Republican farmer should interest a Democrat farmer. The question, "How Can We Maintain and Increase the Dignity and Honor of Our Occupation," was ably discussed, the leading thought being that the Grange is one of the best means of elevating the farmer in his occupation.

The fruit crop of Kansas, comprising apples, pears, peaches, plums and grapes, is very promising, and, with good weather, will be abundant in all fruit-growing counties. Some have more than ever in their history. Apples, and in fact all fruit, is freer from insect depredations and fungous diseases than usual. There will be a larger proportion of first-grade apples than ever. Trees generally in excellent condition, mainly owing to the excessive Spring rains.

Oregon will produce between 20,000,000 and 24,000,000 pounds of dried prunes this year.

The sixth annual meeting of the American Association of Farmers' Institute Workers will be held at Buffalo, N. Y., September 18-19. A large number of delegates will be present from the United States and Canada.

Crop Prospects.

AUGUST 31.—We are very busy in bean harvest; weather extremely bad for beans. They are ripening unevenly and heavy showers cover a good many with mud; great complaint of not podding well. Big vines but few pods. Potatoes late and poor mostly; apples, none; wheat ruined by Hessian fly, but farmers peg away as if there was no such word as fail. S. W. C.

Caledonia, N. Y.

We are having ideal corn weather, and the outlook for late-planted fields grows brighter every day. Nothing but a very early frost can prevent a good average crop. There seems to be a special crop of Potato bugs provided for the late-planted fields. Wheat is yielding better than expected, but there will be a large acreage of rye sown this Fall. Buyers began to ship Bartlett pears about August 25, paying $1 per bushel and 60 cents for Clapp's Favorite. Evaporator men are hustling for the few apples we have. They are paying from 40 to 60 cents for everything on the tree. The Ben Davis brings the latter price, but the time will undoubtedly soon come when the picture given of that variety by Editor Collingwood at our Wayne County Fruit Growers' Association will be a reality, and expert grafters will be in great demand. At least 75 per cent of all the apple trees planted in this section during the last decade have been of that variety, and it will so continue while growers realize a greater profit from them. E. A. G.

North Rose, N. Y.

The Western Corn Crop.

Reports from the West about the corn crop vary widely. The truth seems to be that on the whole the damage done by the drought is not as serious as was at first supposed. There will be more corn than dealers figured on a month ago. One thing however is true. The drought has taught farmers to save the stalks. The following note taken from the Live Stock World is a fair statement of conditions:

"Those who never used shredded fodder don't know its value, and they seem hard to convince. For two seasons previous to this we have cut no hay, have fattened and sold five loads of cattle, and they were fed no hay. Fodder and oat straw in addition to the grain ration also wintered stock and breeding cattle in good condition. I consider it one of the best of feeds for horses either idle or at work. All that is not eaten makes the best of bedding, and is well worth all it costs for manure. I believe it only a question of time, which should be now, where there will be as stable a demand for it as there is for hay and straw. There will be fodder enough left standing in the fields here if properly cared for to winter, in good condition, a large portion of the stock sacrificed by owners in the States affected by drought. Yet people here still continue to let the cornstalks stand in the field, and what cattle they keep grow poor all Winter when here is forage abundant if they would only save it."

Macaroni Wheats for America.

In THE R. N.-Y. for August 24, under Brevities, page 584, you speak of macaroni wheats. Are there any special conditions required for those wheats? This portion of North Carolina is at present producing a fine quality of wheat. The last half-dozen years have proven wheat to be one of our best crops—cash crop at that. Cotton and tobacco no longer have that exclusive distinction. In fact, southern agriculture has shown a tendency during the last few years to grow the crop best suited to the soil and climate, and nearest to the market. With the culture of wheat our milling facilities have almost kept pace. Not more than a decade back this section was a large buyer of northern and western ship stuff and flour; now flour and feed is shipped from here. Last Fall, within the neighborhood of Thomasville and mostly to the south of it, there were upwards of 100,000 bushels of wheat thrashed. That meant $75,000 to the farmers. This Summer has not been as favorable to the perfection of the crop as last; too much rain. Now we begin to need something like a wheat exchange or elevator facilities to handle the large crop that is being raised, and which every effort will be directed to keep raising in the future. It is reported that it took 400 binders to gather the wheat crop of 1900 in Randolph County, the county joining Davidson on the east. During the last three years more than 1,000 binders were brought into this section. Each year sees an increase of improved machinery coming here. The one-horse plow is not the breaking plow, as it was not many years ago; more heavy disk plows and heavy three-horse plows are used to break the wheat land. Last Summer, at the time to break land for wheat, the weather was dry and ground hard. We put four horses abreast to the big three-horse plow, weighted the plow—it had a wheel at the end of the beam—and the plowing went right on. The disk harrow, drag and roller, made a good seed bed. Last Fall the early seeding was almost destroyed by the Hessian fly; years ago, during the days of slavery, when not much wheat was grown, the early seeding would do the best. But now with so much greater acreage and better tillage, with land made so much richer by growing clover and fertilizing heavily, the later seedings, after the middle of October, are better and safer. Besides the Hessian fly in the Fall the late frosts in the Spring right often kill the early-sown wheat. I would like to see the macaroni wheat tried here. J. B.

Thomasville, N. C.

R. N.-Y.—The National Department of Agriculture, Washington, D. C., has issued an interesting pamphlet on this subject. Send and get a copy of it. Seed is to be brought from Italy, as we understand it, and sent into the most desirable places for experiment.

Crop and Weather Notes.

Heavy rains have injured crops and hindered farm work in parts of the South Atlantic States. The weather continues hot and dry in the Missouri and upper Mississippi valleys, and late corn is suffering. In California the weather has been too cool for the proper maturing and drying of fruits, and light frost is reported in Nevada. Late corn in the central valleys is doing well, and will be out of the way of frost by September 20. The week has been unfavorable for cotton. Rust and shedding and premature opening are reported. The apple outlook has slightly improved in Kansas, Indiana, Illinois, Arkansas and West Virginia. Plowing and seeding are well advanced except in Virginia, where there has been an excess of rain, and in Missouri, Nebraska and Arkansas, where the soil is too dry to plow.

The Potato Beetle in Europe.

The agricultural authorities of England wisely take great precautions to prevent the spread of the Colorado potato beetle in that country. Considering the amount of shipping to English ports, and the wandering habit of the bug, which delights in crawling into boxes and barrels, it is surprising that the pest has not gained a stronger foothold there. The following from the Journal of Commerce tells of the lively reception the bug gets when found in an English potato field:

"Several specimens were discovered Sunday in a potato patch near the Tilbury Docks, on the Thames, which caused an extraordinary commotion among the agriculturists. Since the presence of the bug was reported, the Board has caused the ground to be quarantined and all plant and animal life upon it was destroyed. The environs were searched for other specimens and a notice was issued to the public, calling attention to the law, which provides that any person may be fined £10 who does not immediately notify the police of the discovery of the bug. The policemen are obliged, under heavy penalties, to warn the Board of the presence of the bug."

A Practical Method of Co-operation.

One of the chief drawbacks to selling farm produce is the fact that it seems necessary to sell it through middlemen. Why is it not possible for farmers to exchange products to a greater extent than is now practiced? For example, the farmers of the sandy portions of south Jersey produce fruit and sweet potatoes to sell. They buy a part or all of their Winter supply of round potatoes, apples, oats, corn, hay and bran. In Vineland there is a successful Sweet Potato Growers' Association, which sells the produce of a large number of farmers. One barrel or a carload of sweet potatoes can be shipped at short notice. Sweet potatoes have been shipped as far as Dakota every Fall by Vineland growers, and have been stored there for Winter use. Therefore, it is reasonably safe for any Grange or other farmers' organization within 500 miles of Vineland to buy sweet potatoes for members to store for their own use in Winter. Full instructions would be sent for storing. When distant farmers have learned to store them successfully, they can fill their cellars and sell them at a high price during the cold spells in Winter when their nearby village cannot have them shipped in because of danger of freezing en route. So much for the sweet potato side of the problem. Fruit could also be shipped to advantage, but sweet potatoes would be the best to start with.

The farmers of Vineland could use or sell, in car lots at our local markets, round potatoes, apples, oats, corn, hay and lumber; and in smaller quantities butter, cheese, wheat, etc. Even if our sweet potatoes and fruit were not wanted we would like to buy our products in large lots direct from producers. If this method were practiced farmers would gain on both buying and selling, and especially if carloads were shipped on transportation also. If a business of this kind developed sufficiently probably THE R. N.-Y. and other farm papers would set apart a special column for advertising products of the different sections of the country. All that would be needed would be a heading to the column something like this: "This column is devoted to the advertising of farm products particularly with a view to bringing producer and consumer nearer together by means of exchange of produce wherever possible." Under this heading the advertisement could be made very short; for example, "John Smith,——Grange, Little Falls, N. Y. Cheese, apples, potatoes." GEO. A. MITCHELL.

New Jersey.

Wages for Grape Packers.

"Grape help" as we understand the term here in the Chautauqua grape belt, applies to harvest hands, also those employed in tying the vines to the wire in early Spring. It is composed of sturdy women, also boys and girls from 14 to 20 years, and "sissy" men. The prevailing wages are $1 per day without board and $3 to $3.50 per week with board. During the past four years piecework method has developed to some extent. For picking and packing eight-pound baskets in the vineyard, one cent per basket is paid. During the same period there has been considerable development in selling grapes in bulk. These are picked in gift crates holding about 30 pounds each, for which two cents per crate is paid. The piece-work price means that the picker boards herself. Picking and packing baskets in the vineyard is often carelessly done, and to such extent as to impair the reputation of grapes from this belt. Our help, for the most part, is from good families; more so formerly than now. Near canning centers, Italian help is being used more and more. JNO. W. SPENCER.

Woman and Home

From Day to Day.

JUST BEING KIND.

So many bright-hued hopes are vain!
  So many years doth Time devour
In fruitless striving after gain
  To serve the pleasures of an hour!
We toil and struggle hard to reach
  Some bright ideal good, and blind
To happiness within our reach—
  The reflex joy of being kind.

With aspirations pure and high,
  For some grand, noble work to do,
To bless our fellows ere we die,
  We strive with hearts sincere and true;
Ignoble aims we cannot brook,
  Our duties we have well defined,
But 'mid their clamor overlook
  The one most weighty—being kind.

If backward o'er our lives we cast
  A glance, we see transfigured there
Sweet faces—"plain" in that dim past—
  Halo-encircled now, and fair;
"What is this wonder-working power
  Which glorified?" we ask, and find
The secret like the scent of flower,
  So simply sweet—just being kind.
—The Ram's Horn.

*

THE smile cure is one of the latest remedies for morbid melancholy. If you keep the corners of your mouth turned up you can't feel blue, and considering how many bodily ills are intensified by mental depression, an even cheerfulness is a duty we owe to our bodies as well as our souls. When in doubt or depression, just smile a little; if nothing more, the smile will be an antidote against the fretful little lines which, on a woman's face, often mean conscience and self-sacrifice rather than anxiety or ill-temper.

*

VERY good advice on the subject of health is offered by Ithuriel Butters, one of the characters in "Geoffrey Strong," a charming New England story by Laura E. Richards. When the doctor asks him whether he ever studied medicine, Mr. Butters grimly replies, "No, sir! but I've lived with my own bones and insides till I know 'em considerable well; and I've seen considerable of folks, them as doctored and them as didn't. My wives doctored, all three of 'em. I buried two of 'em, and good ones, too; and, like as not, I'll bury the third. She ain't none too rugged this Summer though she ain't but 70. But what I say is, start well, and stay well, and don't worry. You tell your patients that, and fust thing you know you won't have any."

*

ON the occasion of Grange meetings, farmers' institutes or similar gatherings, where there are few facilities for providing meals for those from a distance, some modification of the following plan may prove useful: To raise money for a village charity, a circle of the young ladies of the place took advantage of the gathering of a men's county convention, and served luncheon to the members in rather a novel way. Individual boxes were packed and sold at 25 cents each, a little slip in every box entitling the purchaser to a cup of tea or coffee served at a table set up for the purpose on the village green. The luncheons were put up with the greatest care and daintiness, different articles that might grow mussy being wrapped separately in waxed paper. Two or three homemade bonbons, with fruit, cake, a tiny cup of salad—chicken or salmon—a relish of some kind, like olives or pickles, were included in each box, a Japanese napkin of pretty design being folded and placed on the top before the cover was put on. The scheme was so successful that the same idea was carried out afterward at a church festival, with the additional touch that in some of the boxes went a card bearing the name of one of the young lady attendants, every one of them being thus represented. The man who was lucky enough to draw one of these boxes had the privilege of buying another box, and asking the young lady named to take supper with him.

*

A FRIEND asks how to make plain little cakes, something like short cake, with sour cream. Use a cupful of sour cream which is well loppered but not old enough to have any suspicion of mold about it; stir in a scant half teaspoonful of soda, or just enough to make the cream sweet to the taste; add a little salt and enough sifted flour to make a dough as stiff as a pie crust. Roll the cream cakes out as thin as a pie crust, and cut the crust into long oblong strips

3903 Misses' Five-Gored Skirt, 12 to 16 yrs.

about 1½ inch wide by three inches long. Bake the cakes in a hot oven until they are a rich brown. They should be baked quickly, like a pie crust, and like a pie crust they will increase many times in size. These are a delicious accompaniment to the breakfast coffee, when freshly baked. Dough made after this recipe is excellent for short cake, or as a crust for chicken pie.

*

DON'T forget to have a plant or two of parsley potted in the Fall to keep during Winter in a light place in the kitchen. The leaves produced by these old roots are strong in flavor, and sometimes rather bitter, but it is always a pleasure to have them for garnishing. Parsley can be preserved for winter use by drying. Scald the leaves, dry in a slow oven, and pack in airtight jars. When used, freshen a moment in warm water. Dried thyme, parsley, sage and mint, at least, should always be provided for Winter use. Among dried leaves for flavoring we should not forget bay and orange or lemon. Bay leaves are excellent in soup, stews and spiced meats; orange or lemon leaves give a spicy sprightliness to milk puddings, especially rice. Bay leaves are also used in these milk dishes.

*

FALL traveling hats, very suitable for general wear, are made of frieze or camel's-hair cloth, tucked and stitched to form little ridges over the fabric. Many of them are close turbans, that fit snugly upon the head, trimmed with a knot or loops of bengaline silk and a pheasant's breast or duck's wing. These hats are usually seen in the lighter shades, white, string, beaver, castor, nickel, beige, gray and brown, though they are also made in cardinal red, myrtle green and Wedgewood blue. It is saddening to all friends of the feathered tribe to learn that whole birds and all sorts of wings are again appearing freely in the Fall hats, as well as the plumage of game birds and domestic fowls. The breasts and montures made from the plumage of birds used to provide food are artifically mounted to give very beautiful results, but apparently neither legislation nor sentiment affects the woman who still insists on decorating her hat with a barbaric adornment of pathetic little feathered bodies.

The Rural Patterns.

The girl's skirt shown combines five gores with a graduated circular flounce. The upper portion of the skirt fits with perfect smoothness, the fullness at the back being laid in inverted pleats, while below the knees it takes the fashionable flare. The flounce can be arranged over the skirt on indicated lines, or if preferred, the material can be cut away beneath and the flounce seamed to the edge or, again, the skirt can be cut full length and left plain. To cut this skirt for a girl 14 years of age, 6⅝ yards of material 21 or 27 inches wide, 6¼ yards 32 inches wide or 4½ yards 44 inches wide will be required when the flounce is used; 4¾ yards 21 or 27 inches wide, 4⅝ yards 32 inches wide or 2⅞ yards 44 inches wide when the skirt is made plain. The pattern No. 3908 is cut in sizes for girls 12, 14 and 16 years of age; price 10 cents from this office.

Simple blouses with deep round collars are among the latest designs shown, and are very generally becoming. The design illustrated is tucked across the front to yoke depth and includes tucked elbow sleeves, which are charming when the stock and shield are omitted, but can be made with full length bishop sleeves when preferred. The tucks at the front give graceful fullness below. The original is made of figured louisine silk in shades of pink, and is banded with black velvet ribbon; but all pliable materials suitable for tucking, are appropriate. The foundation or fitted lining closes at the center front. On it are arranged the smooth back, the tucked fronts and the deep collar. The elbow sleeves are peculiar, being tucked in the center and free at top and bottom, and

3907 Blouse Waist, 32 to 40 Bust.

form graceful frills at the elbows. When the waist is desired high neck the shield and stock are added and the plain sleeves can be substituted for the fancy ones whenever preferred. When made unlined the gathers at the waist line are stayed with a band of material, or the fullness is drawn up by means of tapes inserted in an applied casing. To cut this waist for a woman of medium size, 4¼ yards of material 21 inches wide, 4¼ yards 27 inches wide, 3¾ yards 32 inches wide or two yards 44 inches wide will be required when elbow sleeves are used; 4¾ yards 21 or 27 inches wide, 3¾ yards 32 inches wide or 2¼ yards 44 inches wide with bishop sleeves. The pattern No. 3907 is cut in sizes for 32, 34, 36, 38 and 40-inch bust measure; price 10 cents from this office.

Rural Recipes.

Beach Plum Cheese.—Beach plums are a kind of small wild plum. They are very acid. It is considered best to gather them when they have been slightly touched by frost. Put the plums into a jar and cover it. Stand the jar in a pan of boiling water, and continue boiling it till the fruit is quite soft. Next turn them on to a wire sieve and rub them through. This will prevent stones and hard skins getting into the preserve. Then measure the juice and pulp as you put it into a bright preserving pan, and to each pint of pulp and juice allow one pound of loaf sugar. Boil carefully, skimming and stirring well till some will set firmly when cooled on a plate. Put it into small jars or molds and when cold tie down securely. To serve, slip it out of the pot on to a pretty glass dish or plate, and cut into slices.

Grape Catsup.—Wash the fruit, drain, and put into a preserving kettle. Mash well, place on the fire and cook until tender, and then strain. To every 10 pounds of pulp allow six pounds of sugar, one tablespoonful each of cinnamon, cloves, allspice and pepper, and a teaspoonful of salt.

Plum Catsup.—Wash the plums and stew until tender in enough water to prevent burning, then strain and weigh. To four pounds of pulp allow one pound of sugar, four teaspoonfuls of cinnamon, two teaspoonfuls of cloves, two teaspoonfuls of pepper, and salt to taste. This is an excellent relish to serve with roast meats.

Tomato Catsup.—Nearly every housekeeper has her own recipe for this; the following, however, is very good: Scald, peel, slice and core a peck of ripe tomatoes. Use the bright red tomatoes. Place in a porcelain kettle, and cook until tender, and then strain. To this quantity of tomatoes add three large onions chopped very fine, one tablespoonful of salt, one teaspoonful of cayenne pepper, five tablespoonfuls of ground mustard, and a tablespoonful each of ground black pepper, ground cloves and celery seed in a bag. Simmer about six hours.

THE old-fashioned paint that never chalked, cracked nor peeled was made from *Pure "old Dutch process" White Lead* mixed with Pure Linseed Oil, and thoroughly brushed out, using plenty of elbow grease to rub the paint in, and allowing ample time for it to dry between coats.

The brands named in the margin are genuine. Any shade or color required may be easily obtained by using the National Lead Company's Pure White Lead Tinting Colors.

Pamphlet giving full information and showing samples of shades, etc., etc., furnished free upon application.

National Lead Co., 100 William Street, New York.

Western New York Sixty Years Ago.

In 1832 a New England family, seized with the emigration fever, left their home in Vermont to try frontier life in western New York. They bade a long, and as they believed a last, farewell to their relatives, for they were going to the then primitive Far West. They rejoiced in the luxurious mode of travel, altogether new at that time, by which they could have the shelter of a roof as they journeyed, and could be moving on towards their destination while sleeping in their beds. Their hearts often swelled with gratitude to Governor Clinton, whose enterprise had secured for them the Erie Canal with its easy and rapid mode of transit. In two weeks this family made their journey of 400 miles, settling about 30 miles east of Buffalo. Here a log house—a log cabin we would say to-day—awaited them; the heavy timbers of this building anchored it so firmly to the soil that the Winter winds did not blow it away, but they came in at every crevice, with their bitter blasts, freezing the dish towel in the hands that used it, and biting the fingers that held it. The fire on the hearth did its utmost to drive out this discomfort; I think the wide open chimney-place would have taken in a cord of primeval forest wood at 10 mouthfuls. I have seen the first cut of a forest tree rolled with a crowbar into its place as a back-log; the andirons, which had been removed while the log was rolled in, being set back, huge sticks of split wood were piled high in this crater. One word about these andirons. They were made of unadorned iron; if they had had brass knobs on them we should have thought we belonged to the aristocracy, so slight were the gradations between this class and the common people. Soon this fuel gave out a wealth of warmth and brightness, as it blazed and crackled and shot up great tongues of fire. Our times can afford no such luxury as this oak or hickory back-log; but to know what wonders such a fire could do you need to taste some of the dishes it had flavored for the table; the matchless short cake baked before the fire, rounded at its edges, its whole face wrinkled and fluted as only the richest cream could make it, with such a delicate brown as the kiss of the firelight alone could give. The utensil in which this was cooked is as much a thing of the past as the back-log. We called it a spider; I think this was the name by which it was sold in the market; its three long legs, by means of which it was tilted up before the fire no doubt suggested the name. These supported a modern frying pan. On bread days this spider yielded its place on the hearth to the tin baker; some ingenious Yankee is said to have made a fortune out of this baker, by selling a large stock of them to southern ladies for side saddles. Certainly one of them would have held the rider in securely on three sides.

When the vegetables were boiling in the pot and the teakettle was seething and bubbling on the crane, making the lid dance merrily to its music, and the meat was sizzling and sputtering in the spider, now set over a little heap of glowing coals that had been drawn out on the hearth, the times were lively indeed. We little thought then that the power in that teakettle was so soon to revolutionize the ways of the world; that it would send long trains of elegant buildings on steel rails from the Atlantic to the Pacific, from Maine to Mexico, in less time than it had taken to make our little journey on the canalboat. That we did not discover the power under that teakettle lid was our lost opportunity. The world seemed very vast in those days; soon after we began to learn from our geographies that it must be a globe, for Captain Cook had sailed round it in three years. The gladdest day in all the year to the children was when the turkey turned its glossy sides round on the spit, dripping, and oozing out its sweet odors, in the heat of the blaze, until it was done to a turn, so crisp and brown that not an inch of the original color was left. In this open fire and in the savory dishes it furnishes is found to-day the highest charm of gipsying during our Summer vacation. The happiest time of all the day was when we gathered round the hearth fire, which had driven out the darkness and the cold, and left us merrily to crack our nuts; to listen to the jokes of our elders; to eat doughnuts, and to drink our own sweet cider. The shadows dancing on ceiling, wall and floor, playing at the same time hide and seek in the corners, were things to sink deep into the heart of a child. One day our little girl of more than 60 years ago had told her first lie, the penalty for which she served out by sitting down one half hour alone in this great room. She well remembers how gloomily the fire burned, though it was blazing high, and the twilight in her soul fell much faster and deeper than it did in the world outside.

The soil here, almost a virgin one, was very, very deep, up to the hubs it came in muddy weather. The father of this pioneer family was very fond of fine horses, a span of which he always kept, but when the bottom dropped out of the roads a yoke of oxen only could drag the wagon which carried the family to church on Sunday. Our log house was set where two ways met. One day while standing in the open door, we saw a fawn rise from the ground, much as a huge bird might have done, fold its legs under its body, and leaping high in the air, clear the rail fence, then scarcely touching the road which it crossed, bounding over a stone wall, it paused one moment to drink from a brook which ran in front of the house, and sped away across the field to covert. Through wide open eyes memory took in here a piece of statuary such as no sculptor could ever make. This was the only time we ever knew of a deer passing that way; there was no game left in this region for the Indians.

A tribe of Tonawandas who had a reservation near Buffalo made our neighborhood one of its trading posts. A little company of their squaws came often to our house, bringing splint baskets of all sizes which they wisned to exchange for food, apples or cornmeal, which seemed their favorite article of diet, or pork; this last they called squesquaw. They were so honest that we could trust them to pay on their return trip any little balance that might have been left due us. The squaws brought their papooses with them; after having swathed the baby in clothes until it looked like a small-sized mummy, they lashed it to a board which was shaped much like a little coffin-lid; equipped in this manner for a journey the mother would sling the baby over her shoulder until it was well balanced on her back in a perpendicular position; then drawing across her own forehead a broad band or strap which supported much of the weight, she would set out for home, a walk of many miles.

The trundle bed, drawn out from under the larger bed where our parents slept, held two little ones, and on the floor in the same room sometimes Indians, who had been welcomed to a free lodging for the night, snored out the weariness of their day's tramp; I say snored, for I think this must have wakened me one night, as I have a distinct "picture hung on memory's wall" of several of these huge-bodied men wrapped in their blankets lying scattered over the floor, while the dying fire light made the whole scene visible, but I felt no fear. Our latchstring was always out, and a veritable leather latchstring it was, while the door of which it formed an essential part, had neither lock nor key. There was not one haunted house within 50 miles of us, and we had never read the record of any murder that had been committed in all that region. We had learned from the story of "Blue Beard" that men did sometimes break the sixth commandment, for had not Fatima escaped death, only by the timely arrival of her brothers; and in the story of "Jack and the Beanstalk" we had almost heard the dreadful giant's "fe-fo-fum"; these brought down nearly to our own time the fact that men who had blue beards might hang up long rows of their wives in some secret chamber, or if they were giants they might greatly desire the blood of some little boy, who like Jack, had climbed up out of his sphere; the Bible too told us of the assassination of kings and queens and of a few others, but these were to us, only the deeds of very wicked men, in a very wicked age and very long ago.

If our fire of coals had gone out at night under its heavy covering of ashes there was a great stir in the house next morning, and once our six-year-old girl I remember was sent to the neighbors to "borrow" some fire, which she brought home on a shovel. Lucifer matches were then in the dim but not distant future. Our only mode of getting the fire was by striking steel and flint together and catching the spark in tinder. If matches had been in the market I am quite sure the manufacturer of them could never have made a fortune, and we should still have been without them, for there were fewer pennies in those days than there are $10 notes to-day; much of our business was done by barter. Even 15 years later, a man in Rochester who was worth $50,000 was called the rich man, and he was so beset by appeals for charities that little time was left him in his office to attend to his own business! I well remember too when John Jacob Astor was considered marvelously rich—the marked man of the nation—with half a million of money. Everywhere through hamlet and country the question ran "How did he get such a fortune?" this to be quickly followed by the answer: "He has been dealing in furs." The madly rushing world has left behind it these picturesque days of quietness and safety, but in its onward sweep it has gathered up much of comfort, and luxury, and knowledge, and even brotherly kindness which we would not exchange for the good things of the past, and which check the sigh for that which is fast sinking into oblivion. HARRIET S. OSMOND.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

Some Laundry Suggestions.

Even with set tubs two wooden ones of handy size help out amazingly. One had better be kept especially for table linen and for rinsing the finest white things, says Emily Holt in Chicago Record-Herald. Use the other for soaking, but do not soak too long. An hour is long enough to soften and dissolve the dirt, yet not long enough to set it all through the garment. Soaking suds strong with soda will eat and destroy the fabric, but dirt comes out easier, and without damage to the fiber if the soiled things are wet through with and well wrung out of warm soda water before they go in soak. This wetting and wringing out will whiten and sweeten without hurting the clothes. The caustic soda attacks the dirt first and is washed out, or dissolved away, before it has time to eat the fabric. It must not be too strong—a tablespoonful of soda to three gallons of soft water is about the right proportion. Hard water requires a fourth more soda, as some of it goes to neutralize the lime.

Keep a sharp lookout for spots and stains in the sorting. Either wet fruit stains in alcohol, whisky or camphor, or pour a stream of full boiling water through them. A stain once set by suds is thenceforth almost hopeless. Beware especially of grass, paint, mud and wagon grease marks—all of which must be taken out before washing or not at all.

Kerosene in the boil whitens clothes safely, especially such as are yellow from long lying. Use a tablespoonful to a gallon of water. For things very yellow or grimy make an emulsion of kerosene, clear lime water and turpentine in equal parts. Shake together until creamy, then add a cupful to a boilerful of clothes and keep over the fire half an hour. The same emulsion is good for very dirty things, as jumpers, overalls, working shirts, children's trousers. Use it in conjunction with very strong suds, as hot as the hand can bear, and rub it well upon the dirtiest spots. Leave the clothes five minutes before washing out, and be sure the second suds and the rinsing waters are as hot as the first suds.

BUSINESS BITS.

WE have no apologies to make for directing the attention of our readers to a matter of such importance as the saving and proper distribution of farm manures. There is probably no one thing in connection with the whole subject of agriculture which is fraught with so much importance. The conservation and increase of fertility is certainly the keynote to successful agriculture. The first great basis of fertility is the homemade manure pile. It can certainly be best and most economically distributed in a mechanical way. For this purpose we can unqualifiedly recommend the Improved Kemp manure spreader, which is manufactured by the Kemp & Burpee Mfg. Co., of Syracuse, N. Y. It is so constructed that it will spread any and all kinds of manure. The coarsest, hardest and most lumpy manure is torn apart, made fine and distributed in a manner that would not be possible by hand spreading. Strawy manure and that filled with cornstalks, which so seriously annoy the farmer, are handled with greatest ease and regularity. If at all interested in this great economic question, it will pay you to write to the manufacturers for their latest catalogue. In addition to a full illustration and description of their improved spreader, it contains much that is of value on the subject of housing, handling and spreading of manure.

THE Spangler Manufacturing Co., of York, Pa., is the manufacturer of the well-known Spangler low down grain and fertilizer drill. The name gives a very good idea of the character and form of the drill. Being of the low down type, the grain box hangs low, and is in consequence easy to load. This is a particular advantage in loading various kinds of fertilizer which, as our readers know, are quite heavy and difficult to handle. The drills are well and durably made and are excellently suited to general seeding requirements. Write these people for catalogue before buying.

H. K. HARTSUFF, JR., Secretary of Beaver Coal and Coke Co., of Wampum, Pa., writes: "I would just say that two months ago we had three mules that I would have given away if I could have found anyone to take them. After using 15 bottles of Kendall's Spavin Cure on the three mules, we put them to work. They are working now and pulling as much as they were before injured, and I figure that the 15 bottles just saved us buying three new mules, or rather a saving of from $450 to $500. I never saw anything that worked like it, and I will certainly recommend it to all my friends."

THE A. F. Swan Co., of 114 Nassau St., New York, are the manufacturers of the famous Swan's standard roofing, which has been upon the market and in successful use for the past 37 years. This roofing differs from others of its kind in that it is made of either two or three-ply specially prepared tarred felt. The process employed in the manufacture is peculiar to the Swan Company, and the result is a very superior roofing. It is guaranteed to be wind, water and fireproof, and can be laid by anybody, without experience or any expert knowledge. The only tools necessary are a knife and hammer. Write for sample of the roofing, circulars, etc.

MESSRS. SPROUT, WALDRON & CO., Muncy, Pa., are offering to send any of their portable mills on 15 days' trial. This is a new departure in mill selling—and a substantial evidence of the worth of the mills, as it leaves the mill to prove its own worth, even in inexperienced hands. This firm has built up a great business in the 35 years it has been making mills, and is now selling more mills than ever before. Whatever may be needed to equip a grinding room on the farm or a great milling plant can be bought from Messrs. Sprout, Waldron & Co. with the assurance of lowest price and best quality. Surely, there could be nothing fairer than their proposition of letting a mill prove its own worth and utility.

THE well-known National Dairy Machine Company, forced by a constantly increasing business to seek larger quarters, has moved to its new factory, 114-120 William St., Newark, N. J. In the commodious new home, which is fitted with all the modern appliances and improvements for the manufacture of dairy machines, the firm will be able to keep up with the demand for their National hand separator. The sterling worth of this popular separator has been the prime factor in the growing prosperity of this firm. Their offer to ship the machine on 10 days' free trial is proof conclusive of its efficiency and a trial will substantiate the claim that, by its use the milk of eight cows will yield as much cream as that of 10 cows by any other system. Full particulars of the 10 days' trial plan and complete catalogue of their goods can be had on request.

WHAT shall we say of the milk farmer who has a good farm, but makes so little milk that the forenoon he spends peddling it doesn't bring him in 15 cents an hour? It is easy to see why he doesn't make more milk, for we called at his place recently. He has practically no crops, and his haying not yet begun. During the time when he ought to have been haying he was shingling his barns. He's always a month or two behind. Another one had the best recipe we have heard of to avoid plowing and reseeding. His plan is to let his Timothy go to seed every year before cutting; says "it never runs out." When asked as to what good the hay was, said: "Well, I suppose it ain't quite so good, but the cattle eat it all up." H. G. M.

A CURE FOR ASTHMA.

Asthma sufferers need no longer leave home and business in order to be cured. Nature has produced a vegetable remedy that will permanently cure Asthma and all diseases of the lungs and bronchial tubes. Having tested its wonderful curative powers in thousands of cases (with a record of 90 per cent permanently cured) and desiring to relieve human suffering, I will send free of charge to all sufferers from Asthma, Consumption, Catarrh, Bronchitis and nervous diseases, this recipe in German, French or English, with full directions for preparing and using. Sent by mail. Address with stamp, naming this paper, W. A. Noyes, 847 Powers Block, Rochester, N. Y.

Wants, For Sale or Exchange

Farm Managers, Gardeners, Buttermakers, etc., always on hand. No charges to employers. Write us Rural Science Agency, Durham, N. H.

WANTED—Cheesemaker in private creamery by the year, who understands making light skim cheese. State age and nationality.

Apples and Pears

This time of the year we make a specialty of handling shipments of apples and pears, and are now prepared to handle consignments to the best possible advantage. Write us at once for information regarding shipping, etc.; also for stencils.
ARCHDEACON & CO., 100 Murray St., New York

FOR SALE—Thoroughbred HOLSTEIN-FRIESIAN CATTLE of the best families. Also, 30 high-bred Bulls at reasonable prices. Write the MAPLES STOCK FARM, Binghamton, N. Y., WM. ROOD, Prop

White Wyandottes and White Plymouth Rocks.

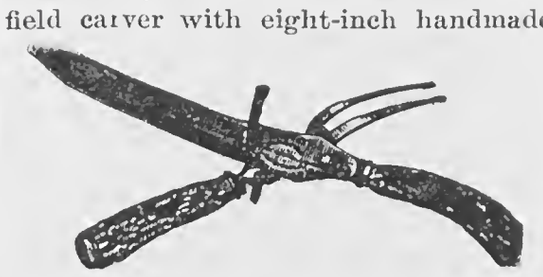
I am now ready to ship pullets and cockerels for those who wish to exhibit at shows or to improve their stock by show blood. Prices reasonable for quality. WARREN WHITE,
Normandy Farms. Newton Highlands, Mass.

The Domestic Sheep.

Its Culture and General Management. By Henry Stewart. An up-to-date book on sheep. The most scientific, practical and useful book ever published on this subject. Indorsed by the world's highest authorities, press and sheep public everywhere. It contains 372 pages of "boiled-down" knowledge and 165 plates illustrating the recognized breeds and every department of sheep life. Price, $1.50 postpaid, or free for a club of four subscriptions at $1 each.

A Carving Set.

Every family needs a carving set three times a day. This set consists of a Sheffield carver with eight-inch handmade



steel blade, buckhorn handle, fork and steel. Price, $1.90; or we will send it for a club of two new subscriptions at $1 each and $1.25 extra money, or free for a club of six at $1 each.

BOOK BULLETIN

FOR SALE BY THE RURAL NEW-YORKER

THE FEEDING OF ANIMALS, by Prof. W. H. Jordan. The relations of plant and animal life; chemical elements of nutrition; digestion of foods and conditions influencing it; relative value of nutrients; selection of rations and general management. A most instructive work on the principles and practice of feeding and the composition of feeding stuffs. Price, postpaid, $1.25.

CUT-PRICE BOOKS.—Any of these 20-cent pamphlets sent postpaid for 10 cents:

Fruit Packages.
Country Roads.
Memory Training.
Canning and Preserving.

THE RURAL NEW-YORKER,
409 Pearl St., New York.

MARKET NOTES

TOMATOES.—There are plenty of these on hand now from New Jersey, although the appearance and quality are inferior. Growers say that the trouble is caused by wet weather and lack of sunshine. The color is a sickly greenish red; the fruits are knotty and irregular in shape, and some are cracked badly. Considerable rot also is reported.

POTATO PRICES have dropped, and none is now quoted in this market above $2.75. There are two reasons for this: the late crop is turning out better than was anticipated, and consumers have become tired of paying over $3 a barrel. No further material drop is likely to occur at present. A range of $2 to $2.75 is not excessive for the consumer, and removes from trade the restrictions caused by extravagant prices.

APPLES AND PEARS.—There is a large supply of inferior pears, which can hardly be sold at any price. Good Bartletts are scarce and selling well. A few excellent Fall apples are seen and a limited quantity of the choicest are being exported. Shipping facilities have been so much improved that Fall apples packed in boxes are said to arrive on the other side in good condition, and it is possible that a quite extensive trade may be worked up in this early fruit.

HEBREW HOLIDAYS.—Several of these occur in the Fall. On September 14-15 the new year, 5662 according to Jewish reckoning, is observed. Then follow the Day of Atonement, September 23; Feast of the Tabernacles, September 28-29; and the Feast of Laws, October 5-6. There will be a demand for prime live poultry for these celebrations—chickens, fowls, ducks and fat geese. Poultry intended for these markets should be on hand four days before the dates mentioned. This will close up the special live poultry trade until Purim and Passover, in the Spring.

MELONS.—The finest watermelons I have seen this season are now on hand There seem to be a good many of the larger sizes, which were so scarce earlier in the season. The cool weather, however, keeps the prices down. There are plenty of the Colorado muskmelons, which sell for very high prices, $2 to $2.50 per bushel crate unless overripe. The supply from New Mexico is grown under practically the same conditions of irrigation and sunshine, and sells at the same figures. There is a large quantity of melons grown in different parts of the East, masquerading as Rocky Fords, but lacking in quality. The rains have damaged the crop of Hackensack and other nearby melons.

WESTERN FRUIT MATTERS.—The Pacific Coast occupies a peculiar position so far as market facilities are concerned. California, for instance, produces great quantities of the finest oranges, grapes and plums, but must ship them hundreds, or, rather, thousands, of miles to reach consumers. New York, New Jersey and Connecticut are extensive fruit producers, but seldom have any trouble in disposing of the better grades at least, for they are within a short haul of the greatest market in this country. But California, while an enormous producer, has no such hungry next-door neighbors as New York, Boston and Philadelphia. The stretch of country between the coast range and the Mississippi is so thinly settled, and much of it so far from railroads, that it can use but little of this surplus of fruit. If the time ever comes when these great plains are thickly populated, California's market difficulties will be largely wiped out, and the East may have to do heavy bidding to get as many western oranges and grapes as desired. The problem of transporting and disposing of this perishable fruit is a serious one, and western growers soon learned that, instead of working alone, each for himself, organization and the most thorough business methods were necessary in order to get a fair return for their invested time and labor. These organizations have met with much opposition, often from those who could have been most benefited by them. In the cured fruit business the situation is different; that is, there is a whole season in which to dispose of the crop, while orange growers sometimes find that there is a shortage of cars just at the time when the largest shipments should be made. The Raisin Growers' Association has seen many ups and downs, though, on the whole, it has been fairly successful. This year a new form of contract is offered, in which the growers practically lease their vineyards, giving them entirely into the hands of the Association, and becoming merely profit-sharing employees of it. This plan was adopted to give the directors more complete control of affairs, with less interference from individual growers who do not understand the situation, and try to run things in their own way. Naturally, the growers hesitate about signing a contract of this sort. It certainly would be a dangerous thing to do unless the integrity and business ability of the officers were unquestioned. The indications are that there will not be enough signers to carry out the new plan, as some outside growers are bitterly opposed to the present management. The Association, however, has practical control of the market, and it is reported in trade papers that plans will be made to freeze out its opponents so thoroughly that they will be glad to come into the Association or go out of business. W. W. H.

PROF. MUNSON'S NEW GRAPES.

PART II.

Xiuta: Clusters of the largest size, well shouldered and long. Berries very black, having no bloom, as large as the Concord, sprightly, rich, vinous. The pulp is tender, readily freeing the seeds, no sour unpleasant taste like the Concord. When fully ripe the pulp dissolves in eating. This grape is very vigorous and prolific, and in every way superior to the Concord. It is a good table, market or wine grape. Post Oak, Rupestris and Labrusca.

Husmann: Clusters of the largest size, thick through and long, filled with beautiful berries of good medium size. The size is remarkably uniform, every berry being alike. Skin tough and jet black beneath the fine bloom. This grape is an extra good keeper, and may be shipped long distances. Quality very good, sweet, sprightly and agreeable, much better than the Concord; no foxy flavor, no sour pulp. Vine vigorous and very prolific. This is the big southern grape to capture the northern markets with in August. Parentage Post Oak, Bourquiniana, Labrusca and Vinifera.

Success: Cluster as large as the Concord and compact. Berries variable in size from small to above medium, very sweet and rich, of the best quality. The seeds part very readily from the pulp, and there is no need to swallow them in eating. The skin is thin but tough, and it is one of the best keepers in hot weather. There is no grape that could be shipped a greater distance and held longer on the market in good condition. The vine is very vigorous and highly prolific. It has taken several years to establish the value of this grape, for it has grown steadily better from year to year, until now it takes a foremost place among the most promising of all as a most valuable market grape. If Prof. Munson had produced no other grape than this his life work as an originator must be pronounced a success. Parentage Post Oak, Rupestris and Bourquiniana.

Talequah has a beautiful conical cluster above the average size. The berries are dark red, almost black, about the size of the Delaware grape, and the quality is nearly or quite as good. This grape is almost pulpless, for it melts in the mouth in eating. The skin is thin and tough, does not crack and the grape keeps fairly well. Parentage Post Oak, Rupestris and Bourquiniana.

Captain: Clusters much larger and longer than the Concord. Berries a little above medium size, bloom slight, pulp easily freeing the seeds. Quality high, much better than the Concord. It is a rich good grape that will make a market for grapes wherever it is sold. Ships well, does not crack and the large clusters are very attractive. Parentage Post Oak, Rupestris and Labrusca.

Salado: A fine black grape that compares well with the Concord, adapted to limy, adobe and the black soils of the South where few other grapes will grow. It stands drought, has a vigorous vine, and is highly prolific. It is a splendid southern market grape, but being pistillate must be planted near a pollenizer.

Cloeta: A very high quality black grape. It has a sweet, rich, pure vinous flavor and is hard to excel in quality even among foreign grapes. An extra fine table grape, good for market, and also likely to prove valuable for wine making. The cluster is a little smaller than the ordinary Concord, but the berries will average as large. It does not crack, keeps well and is firm enough to make a good shipping grape. The pulp is exceedingly tender and the seeds part from it as readily as in the Vinifera. The vine is vigorous, healthy and highly prolific. This grape and Shala, another of the same parentage, and fully as good, are among the later triumphs. Shala differs in having more bloom upon the berries, the berries not quite so large, but the quality is remarkably fine, exceling the Delaware. Post Oak, Rupestris, Labrusca and Vinifera.

The following were noted among the red varieties:

Headlight: Cluster and berry good medium size. Cluster compact and finely shouldered. Berries bright red, becoming dark red when fully ripe. It is nearly equal to the Delaware in quality, quite sweet and becomes sweeter and finer from hanging on the vines, which it does for over a month in the South in the hottest weather. It is the earliest of all grapes to ripen, being several days earlier than the Early Ohio or Champion. The vine is healthy, vigorous and prolific, outyielding the Delaware. It will prove a very valuable early market grape. It may be introduced this Fall. Parentage Labrusca and Vinifera.

Atoka: A dark red grape with a fine Delaware flavor. Clusters two or three times as large as the Delaware, large and long and heavily shouldered. Berries about the same size and quality the same. The pulp frees its seeds more readily than the Delaware. The vine is vigorous and very productive. It has proved a fine near market grape. Post Oak, Rupestris and Vinifera.

Yomago: This grape has also strong characteristics of the Delaware, but it excels it on several points. It is more prolific; it grows better from cuttings; the foliage is less liable to mildew; the pulp is more tender, readily freeing the seeds; the size of the berries is a little larger; it is a brighter red, a few days earlier, and the quality is richer. It has proved a fine early market grape. Labrusca and Vinifera.

Delago: A fine red grape with a rich Muscat flavor. Clusters medium size, cylindrical; berries ovate, as large as Brighton, bright red with little bloom. Skin thin but tough; does not crack. Pulp tender, easily freeing the few seeds, rich, sweet and quite juicy. It is greatly relished as a table grape, and sells at outside prices. The flowers are pistillate and a self-fertile vine blooming at the same time must be near it. It has proved a splendid mother vine for hybridizing purposes. The growth is vigorous and prolific. Labrusca and Vinifera.

The white grapes were compared with the Calabrian, a fine foreign grape, and Niagara. Olita: Cluster medium size, very beautiful and attractive. Berry nearly as large as the Calabrian and of better quality—sweeter, very rich and aromatic. Color a translucent pearly white. Skin very thin and delicate but does not crack; ships as well as the Niagara. One of the finest dessert grapes. Parentage Labrusca and Vinifera.

Rommel: Cluster as large as the Niagara, and equally as good shipper. Berries as large as Calabrian and sweeter than the Niagara. Can be eaten in large quantities, quenching thirst and not cloying the appetite. It is a superior market grape, in great demand in Texas. Vulpina, Labrusca and Vinifera.

Biondin: Cluster as large as Niagara, more compact. Berries equally large and of better quality—less pulpy. It keeps well and is a good shipper. One of the few white grapes with Post Oak blood. Post Oak, Labrusca and Vinifera.

Hidalgo: A grape of remarkably fine quality, sweeter than the Calabrian, richer and almost as pulpless. Cluster not quite so large as Niagara, but more beautiful and attractive upon the table or in the market basket. The skin is very thin, but firm, and the grape keeps well and ships well. Labrusca and Vinifera.

Wapanuka: Is probably the best American white grape yet produced. The cluster is as large as Niagara, while the berries are larger than the Calabrian. The quality is also better than the latter, sweeter and very rich in exquisite flavors. Its very large beautiful pearly white berries are highly attractive upon the market. It is one of the finest table grapes, and as much superior to Niagara in quality as that grape excels the wild fox grape. It is a fine keeper and may be shipped a long distance if carefully packed. The skin is very thin but tough, and does not easily crack unless overripe. In vigor, health and productiveness it is the equal of the Niagara, and in hardiness probably superior. This grape is one of the great triumphs of the hybridizer's art and may fitly crown the brow of the world's greatest grape specialist. Vulpina, Labrusca and Vinifera.

Prof. Munson is also engaged in improving Vitis rotundifolia, the scuppernong grape of the South. He has produced several hybrids combining Post Oak, Labrusca and Vinifera. So far the scuppernong type of vine, leaf and fruit is little changed, except that the clusters are a little larger, and one of the vines shows a remarkable increase in productiveness. A few more crosses will break the type, when we may expect a long list of decidedly new creations in grapes, with new and marvelous flavors. The Professor's health is impaired by occasional attacks of fever due to a severe injury several years since. We hope he may be spared yet many years to prosecute his noble calling. G. L. TINKER, M. D.

Ohio.

Tears

Many a woman has periodic crying spells. She meets her husband with eyes red and swollen and he cries out: "What has happened?" "Nothing" his wife replies. "I don't know what is the matter with me, but I just had to have a good cry." Men don't have crying spells. It would seem therefore that an affection confined to women must have its cause in the womanly nature. There is no doubt that a diseased condition of the delicate womanly organs, is in general responsible for feminine nervousness and hysteria.

The use of Dr. Pierce's Favorite Prescription makes women happy by making them healthy. There are no more crying spells. "Favorite Prescription" cures inflammation, ulceration and female weakness. It makes weak women strong, sick women well.

There is no medicine "just as good." Accept no substitute.

"For three years," writes Mrs. Mary A. Sasser, of High, Lamar Co., Texas, "I suffered with falling of the womb, also ulceration of the womb. After using three bottles of your 'Favorite Prescription,' four of 'Golden Medical Discovery' and two vials of 'Pleasant Pellets,' I found relief. I am able to do my work with ease. I recommend your wonderful medicine to all my friends, for I truly believe it saved my life."

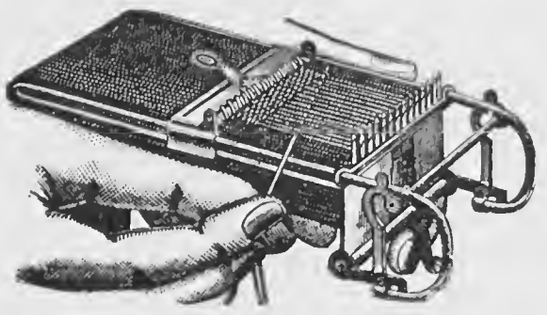
Free. Dr. Pierce's Medical Adviser, in paper covers, is sent *free* on receipt of 21 one-cent stamps to pay cost of mailing *only*. Cloth binding 31 stamps. Address Dr. R. V. Pierce, Buffalo, N. Y.

Pale Weak Women.

Learn how to be cured at home. Write DR. LYON MEDICINE CO., Coldwater, Mich., Dept. 6.

A Darning Machine.

This is the only successful darning machine we ever saw. We have tried others that were absolutely of no value. This one is little short of perfect. It enables you to mend underwear, stockings, curtains, table linens, clothing, and does an endless variety of art and fancy weaving better, easier and quicker than



by any other way. Full directions accompany each machine. When a lady has once used this little machine, she would not do without it for any consideration. We will send it postpaid for $1, or for two new yearly subscriptions at $1 each. All money returned if not satisfied.

On the Lackawanna Limited.

Having decided to visit the Pan-American, the first question to be settled is the route by which to go. There are a number of lines by which the tourist can "go West," but among them all none equals in convenience, comfort, celerity, certainty, economy and varied and interesting scenery the LACKAWANNA RAILROAD.

"The finest train to take, all things considered, and probably the finest train by which Buffalo can be reached from the East, is the LACKAWANNA LIMITED, which leaves Hoboken every noon, arriving in Buffalo at 10 P. M., making the 410 miles in just 10 hours, and always on time. This train covers the greater part of the journey by daylight, and the trip is well worth taking for the scenery along the line alone. The corresponding train in the opposite direction leaves Buffalo at 11 o'clock in the morning, arriving in New York at 8:55 P. M."—Bristol (Conn.) Journal.—*Adv.*

Live Stock and Dairy

DAIRY FARM NOTES.

WEEDS.—I was interested a few days ago in an address at our Pomona Grange upon weeds—not on account of its offering any very satisfactory method of getting rid of them, but it seemed to open my thoughts to their real value. To free a piece of land by hand labor is impracticable, and too expensive, unless it may be when introduced. Careful watch will keep them out for a time. We are now watching out and pulling wild carrot, but I am satisfied that it is only a question of time when with that weed pulling will be as much out of the question as it is now with Orange hawkweed. It is easy to say, keep out the weeds, but the saying is not unlike a hundred other things in farm practice. If it was as easily done as said, either in print or from the platform, every farm would be a garden and every farmer a bondholder. The question becomes more complicated in the East by reason of large areas of broken land that are breeding places for every manner of foul stuff. Now I am not writing from the standpoint of having solved the trouble, but we are working along lines that are perhaps as practical as any, for large areas.

CULTIVATION.—The Department at Washington published a bulletin giving treatment of over 100 weeds, and fully 80 per cent had only one treatment presented, viz., cultivation and rotation of crops. This method is the only general treatment possible. Wild mustard or charlock is an exception to the rule. This weed seems to thrive under good treatment; the seed will lie dormant a long time, making it a disagreeable thing to handle. For a dozen years or more we have been very carefully grading seed grain, and separating out all foreign seeds, until we were reasonably free from the yellow weed. The machine this year was out of condition, which was not known when the men cleaned seed grain. The work was poorly done, some seeds left in, and sure enough, the grain fields showed the yellow in due time. I am satisfied that this weed can be safely combated if we stop sowing the seeds.

USELESS FENCES.—The silo has come to be an important aid in weed-seed destruction. If they get in there they die. We are fast removing another weed burden. Our teams are now engaged in moving away a mile of fencing, mainly road fence, which had been necessary in pasture and driving cows to it. The fence value is easily $100, which will be saved because it will take the place of some purchased material. The land will be more easily worked, and to the eye, how much value? Oh, I don't know. This much I do know, that this removal and cleaning up is the last of the kind, making altogether about two miles of trash, stone walls, etc., which we have been patiently working at for a long time; that is, as fast as we had the money to do the work. This job takes away every rod of fence not absolutely necessary on our farms, as they are now managed. This is no new thing, but as I ride through the State I see miles of fences kept up, the value of which would pay the interest on the mortgage. Get rid of the fences as far as possible, clean up the roadsides as fast as you can, and another weed-breeding establishment has been removed.

BULKY COW FOOD.—I do not wish to appear ridiculous when there is so much talk about high-priced cow foods, but really we have so much of the bulky, coarse foods that we are at loss to know just how to handle them all. An immense growth of clover has come on, more than enough corn to fill the silos, and such a growth! Corn planted in June is 10 to 12 feet high on an average, and earing splendidly. The second-growth clover is being fed to the cows; all they will consume, but Winter will come before they can eat it all. It rains every day, or nearly so, and to cut it for hay would be unsafe. I shall try 10 tons or more in the silo with the corn, feed all we can, let some of it remain, and possibly plow under a small area. But from present indications the Spring sowing of clover, both upon Winter wheat and Spring grain, will get so large as to endanger the crop by smothering; seven acres of clover on Winter wheat now stands knee high. Cows to eat it will cost $50 a head, and stables are now, or will be later, full. It is my judgment that a surplus to look at may be a good thing. The Alfalfa is ready to cut again, the third crop; while the Red clover is about good enough, the Alfalfa seems to have suited the cows a trifle better. I am now interested in feeding problems, just a trifle out of the usual run of questions. We are feeding one dairy all of the green clover they will eat; another all the well-eared corn they will eat; another green oats, a small ration of three pounds middlings and gluten, and corn. The last-named are giving the most milk per cow, but there are other reasons than the kind of food. The first two are much alike in lactation, age, and ability to give milk, and they are getting quite different rations; one of them corn, the other clover. It proves that well-eared green corn is a pretty good milk-producing food, and it also proves another thing that I have contended for, and that is the necessity of feeding enough to satisfy every demand of the animal in succulence and bulk. As I write, the foreman who is feeding the clover has been in, and I have asked him to see whether the cows will not eat just as much clover and a daily ration of green corn besides. I think that they will, and, furthermore, produce more milk. In a week or 10 days the cows will tell the story, and I shall copy it here.

SOWING WHEAT.—The experience of the past three years has put my mind in a state of uncertainty in regard to the proper time to sow Winter wheat. Our custom has been to sow late in August or early in September, which we did three years ago. Two years ago the soil was so hot and dry that it seemed unwise to put seed into the ground, and, by the way, I know of seed being injured by the heat before it could germinate. We therefore waited until October 1 before sowing. The growth, of course, was small—not quite enough to cover the ground; but the yield and growth of straw was very good. Much the same climatic conditions prevailed last year, and we sowed late, even sowing one piece November 1. This late-sown, with the heavy snow, proved the best of the whole sowing. In order to get around the whole trouble, we are going back to first principles, and commenced sowing the first week in September, in order to get through before silo filling. It is this ever changing of natural conditions, this kaleidoscopic presentation of rain and snow, heat and cold, drought and flood, that calls for good judgment and makes farming, after all, attractive to the thoughtful man or woman. I suppose other occupations are much the same, but to me the counter work of the merchant, the circumscribed horizon of the mechanic, or the worry and anxiety of the speculator lack the easy, attractive, changing panorama presented daily to a wide-awake farmer.

DAIRY MATTERS.—I am at loss to know why the Wisconsin cheese markets have ruled so much higher than our own; nearly one cent a pound for fully two months. The casual observer would say at once that drought is responsible, but I do not think so. Cheese can be put into the western markets at one-half cent a pound, provided all other conditions are uniform. I saw one of our own large dealers just on his way from Chicago, who explained the situation as purely speculative on the part of a large New York concern. This explanation somewhat relieved the tension on my mind. With Lewis County making the high scores at Buffalo, as she does at nearly every cheese show I don't like to see these Wisconsin fellows getting more money. Their product is certainly not better than ours, if as good. I am not a believer in reputation, only so far as backed up by quality. In every class of goods to-day name and brand count only as the quality is back of them, and while we said for years that the West could not make fine cheese, they are making it just the same and we have in New York, since we came to realize the situation, made rapid strides in quality. The State Department has done much for our cheese interests. Lewis County, which has become famous for its home-trade product, can give credit to Mr. Horace Rees, State expert, for the unselfish effort which he has made in behalf of our chief product. I don't believe in waiting until a man dies before telling him of his good works, if he has any. The Lewis County cheese interests should erect a monument to Horace Rees. My local pride, or State pride, is quickened by the demand from other States for agricultural material. Prof. Anderson and Prof. Ward of Cornell have gone to California, and now rumor has it that W. E. Griffith, butter instructor at Cornell, has been invited to take charge of their new dairy school, which all means but one thing; New York is still at the dairy head, but she can maintain her position only by the most persistent effort on the part of every one connected with it. Cow keepers and feeders, butter and cheese makers, all must work together. H. E. COOK.

KILLING YOUNG HORNS.—I want to know what to use to destroy or kill the horn just starting to grow on the young calf. I have seen in print some form of caustic paste or caustic stick used for that purpose, but am not sure of it now. J. B.

Thomasville, N. C.

Caustic potash is used for the purpose. The hair close around the horn is clipped off and the horn moistened with warm water. The stick of caustic potash is then held to the little horn until the germ is killed. This must be done when the calf is very small; otherwise the horn will not be thoroughly killed, but will send out a rough stub.

Horse Owners Should Use
GOMBAULT'S
Caustic Balsam
The Great French Veterinary Remedy.
A SAFE, SPEEDY AND POSITIVE CURE.

Prepared exclusively by J. E. Gombault ex-Veterinary Surgeon to the French Government Stud

SUPERSEDES ALL CAUTERY OF FIRING

Impossible to produce any scar or blemish. **The safest best Blister** ever used. Takes the place of all liniments for mild or severe action. Removes all Bunches or Blemishes from Horses or Cattle.

As a **HUMAN REMEDY** for **Rheumatism, Sprains, Sore Throat,** Etc., it is invaluable.

WE GUARANTEE that one tablespoonful of **CAUSTIC BALSAM** will produce more actual results than a whole bottle of any liniment or spavin cure mixture ever made.

Every bottle of **Caustic Balsam** sold is Warranted to give satisfaction. Price **$1.50** per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

BARRED ROCKS that lay over 200 eggs per head per year, must have been bred for that purpose not for fine feathers and show-room points. Our method, attending hens by which we do, and anybody can, gain the high mark in egg production, is the only pure and proper one to adopt and worth a hundred dollars to anyone interested in poultry We breed eight different kinds of chickens for egg-production only. We sell stock and eggs at all seasons. Have for sale at present April and May-hatched Barred Rocks as follows: Two pullets, one cockerel for $4; 10 pullets, 1 cockerel for $12; cockerels in lots of 1 to 25 for $1 per head. With every sale amounting to $4 or more, we give our method complete, free of charge, and guarantee if adopted, you will get 200 and more eggs from every pullet in one year. We have 1,000 of the birds. Our method attending hens is sent to any address upon receipt of $1. Address MT. CLEMENS POULTRY FARM CO., Lock Box 762, Mt. Clemens, Mich.

Don't Let Hens Loaf.
They'll work overtime on raw cut bone. A worker lays, a layer pays. You can loaf half the time and still cut more bone with

Mann's Bone Cutter 1902 Model.
than with any other type. It cuts all shin bones, meat and gristle. Wastes nothing. Never clogs. 10 DAYS FREE TRIAL—no money in advance. Free Cat'lg explains.

Ailing Animals.

ANSWERS BY DR. F. L. KILBORNE.

Cow Affected With Warts.

A cow four years old last May is affected with numerous warts which have grown on her teats since last Spring. How can they be removed? She is a valuable cow, and I do not wish to beef her. C. W. B.
Bethel, Conn.

Rub thoroughly with pure vegetable castor oil after each milking, and continue for at least three or four weeks, if necessary. Such warts can often be removed by the castor-oil treatment, without making a sore, as in the case of the use of acids, which would be undesirable on the teats of a milch cow.

Heifer Weak in Back.

What can I do for a fine 17-months' heifer, that appears weak in back or legs? She can hardly get up, and then staggers around. She has been this way for about two weeks; I do not see much change. She has eaten, drinks, chews her cud all right. For the past day or two has not drank much water. F. W. G.
Wallingford, Conn.

The weakness may be due to sprain or other injury, or to some general diseased condition. If possible have the heifer examined by a competent veterinary surgeon, to ascertain the seat and nature of the trouble. If there is no available veterinarian, try the following course of treatment: Rub the whole region of the loins with ammonia liniment, sufficient to blister mildly. Internally give a small teaspoonful powdered nux vomica in feed three times daily, and gradually increase the dose to two teaspoonfuls at the end of a week or 10 days. Continue for two or three weeks or longer. If twitching or jerking of the muscles should be observed reduce the dose of nux.

Pigs Weak in Hind Quarters.

I have a litter of seven pigs 13 weeks old; all are apparently thrifty and are good feeders. About three weeks ago I noticed one of them rather slow in getting out of its nest; would get on its fore feet and then rest again until feed or something would excite it into action. When moving it walks stiff with its hind legs, and when standing still the hind feet would be drawn nearly centrally under the body. Later examination developed what appears a hard substance on the inside of the hind leg just below the knee joint, and extending about one inch down the bone, but not entirely around it. When not moving the pig lets itself down on its hind quarters, evidently for relief. There are two more of the same litter beginning with the same trouble. The inside floor is of cement and nest kept dry; the outside is plank floor. With their feed they had a daily supply of grass, pulled up by the roots; have never fed any kind of condition powders. I have now of all sizes 36 swine, four Chester White brood sows, one full blood O. I. C. boar. The remainder of my stock is a cross of the above. I expect to put the pigs out on broader range as quickly as I possibly can. We fence for our stock; not against our neighbors. Can you tell me what to do to restore my pigs? What work on swine would you recommend me to get? J. R. N.
Bloomsburg, Pa.

Pigs get weak in their legs, and especially their hind quarters, from various causes, such as injury in fighting or slipping, confinement on hard floors, overfeeding, rheumatism and worms. I suspect the trouble in these cases is due to one or more of the three first-mentioned causes. Place the affected pigs on a ground floor, or preferably a small yard, but where they can have a dry, comfortable nest to go into when they wish. If the pigs are fat, reduce the grain ration, or take it away entirely for a time. If there is constipation feed boiled flaxseed meal or oil meal in their slop. Swine Husbandry, by F. D. Coburn, is an excellent book; price $1.50 from this office.

A TALK ABOUT SWINE.

Our experiments indicate that, if there is any difference, cross-bred swine are superior to purebred for quick fattening if put in a close pen and fed a well-balanced ration. That rule, however, holds good only in the case of a first cross, or certainly where a purebred male is used; if followed down beyond that, results are by no means so satisfactory. There seems to be a prejudice in this eastern country against black swine, but we have never been able to find any valid objection to the breed, as they are easy keepers and respond quickly to generous treatment. Several years ago a young Poland China sow about due to farrow was taken from the herd and placed in a yard about 100 feet square, where there was good grass, and the man in charge was told to cut the feed down, as the animal was too fat; later the orders were repeated, as no reduction in flesh was perceptible. Still later the writer walked some distance again to criticise the man for overfeeding the sow, and after listening he replied: "Good heavens! I have fed that sow nothing but water (and the grass she helped herself to) for three weeks, and unless you want her kept on wind that is about the best I can do." The next morning there was a nice litter of pigs in that yard, and all were raised.

We have nearly the whole farm of 400 acres fenced "to scare hogs," and all breeds are, as a rule, given free range during the Summer, as most of our stock is sold for breeding purposes. We have never had any trouble to speak of with disease, although we frequently have more than 100 hogs on hand at a time, and we have always believed that our freedom from disease was due in a great measure to the fact that our swine were given extensive range, there having been at different times considerable loss by disease in our immediate neighborhood. A neighbor of the writer's has for several years fed for his own use a pair of Suffolks, and two years ago, in a dark pen and on a cement floor, the animals got crooked-legged, lame, and were nearly a failure. The next year, at my suggestion, a large window was put in the pen, part of the cement floor covered with boards, and another pair of Suffolks given exactly the same treatment as before, with the result that everyone who saw them thought they were about perfect. For a large hog the Jersey Red would probably be as satisfactory as any, but for an animal to be brought to a marketable condition as quickly as possible, especially if he was expected to pick up a part of his living in the pasture until late in the Summer, we should probably favor the Suffolks, with the Poland Chinas a close second. J. D. VAN VALKENBURGH.
Chenango Co., N. Y.

Hen Profits.

The profits of a flock of hens vary about as the "square" of their healthfulness. I have known flocks in a fair condition to pay a profit of 25 cents per hen, and others in better condition to pay a full dollar each. Sickly or diseased fowls are an abomination. We use every precaution to keep the flock in perfect healthfulness. Whenever I find a hen ailing or slightly drooping, I remove her to the "hospital"; that is a roomy pen apart from the other fowls. In a few days she is usually "on her feet" again. Before returning that hen to the flock she is marked. This is done by placing a wire around the leg. I get some annealed wire, wind a few turns about a round stick half an inch in diameter, and then cut it into pieces at each turn. These turns are placed on the hen's leg, without fastening, except what the resistance of the wire itself holds. The mark means that the hens wearing it are to be disposed of at the first favorable opportunity, no matter what is done with the rest of the flock. H. M.

Grain Hay in California.

We have frequently mentioned the fact that in California "hay" is wheat or barley cut while green and cured as we cure Timothy or clover. The Pacific Rural Press has this to say about a Government contract:

"The War Department knows of something which they call Timothy hay. We used to know all about this Timothy back East, but we cut his acquaintance when we came to California. The army people are not so; they propose to stand by Timothy to the bitter end no matter in what part of the world they are, and as for hay—by any other name than Timothy it does not smell so sweet. The result is that army contractors are obliged to chase Timothy hay way up in the State of Washington and pay nearly twice as much for it as they could get fine cereal hay for in California. The Department says our hay is nothing but straw, and it calls loudly for its friend Timothy. The result is that though on a pinch the army bought last year 20,000 tons of California hay, which was shipped to the Orient, this year not a pound, it is said, is being taken, although this year this State has produced a larger and better hay crop than in many seasons past. Through advices from the North the fact is established that in June 6,000 tons of Timothy hay were purchased in Seattle at $21 a ton. This was loaded on the steamer Algoa that had cleared from San Francisco with a partial cargo and completed her clearance from Seattle with Government contract hay. This hay is justly regarded as inferior in quality when compared to the California product, and at the price named, based on the ruling quotations, an excess of $21,000 was paid by the Department.

STAND by the kicking cow. I have six grade Jerseys; I think they have more vitality than purebred. Place cow in stanchion and tie hind legs above gambrel with three-quarter-inch rope or heavy strap; be sure to draw gambrel close and tight. We always use this on heifers for a few days. C. N. H.

WE notice the many ways suggested to handle that kicking Julia. While all may be good we know one way to be practical. Our plan is to use a common neck-yoke strap (1½ inchx5 feet), wound twice around each hind leg *above the hock*, and buckled firmly. The cow cannot upset the pail, harm the milker in any way, or injure herself. We have used this device for several years with good results. O. B. S.

SORE EYES IN CATTLE.—The Indiana Station warns farmers against a strange eye disease which is troubling cattle. Prof. R. A. Crane says in a recent bulletin: "The symptoms are local and general. The body temperature is raised, the appetite interfered with, and rumination checked. In the mild cases these symptoms are not marked. When first affected one or both eyes are held nearly closed, the lids swell, and tears pour over the face. A whitish film forms over the eyes which may become dense. The cornea may bulge forward, owing to the pressure of the abscess from within. Yellow spots from the size of a pinhead to that of a grain of corn form, and from the margin will radiate reddish lines. These are abscesses, and when they heal whitish scars will take their places. One eye may be attacked and then the other. The course will last from three to six weeks, but it rarely happens that there is complete blindness in both eyes. The treatment is comparatively simple. Keep the badly affected cattle in the shade of a woods, or in the barn if necessary, during the middle of the day, to prevent aggravation. Locally, apply equal parts of finely powdered boracic acid and calomel, by means of a small insect powder blower. This can be done quickly with little restraint, and is preferable to an eye wash for the cow."

Every year, Bronchitis, under the mistaken name of Consumption, sweeps thousands of people to a premature grave. Dr. D. Jayne's Expectorant nearly always cures this form of disease.—*Adv.*

"The Separator"
is the title of a paper containing an expert's reasons and opinions on the different kinds of dairy separators. It is well worth reading and no one should buy any cream separator before seeing this. We send it free to any applicant, together with Catalogue No. 153.

Horses, Cattle, Sheep and Swine

$2 Book for $1

We have yet some copies left of a lot of slightly shelf-soiled books of **Horses, Cattle, Sheep and Swine,** by Curtis, that we will mail postpaid as long as they last for $1. This book is the standard work on live stock. It is used as a text-book in almost all agricultural colleges, and is indorsed by all leading authorities on live stock. It is a large book, fully illustrated, and requires 16 cents to pay postage alone. These copies are in condition for any library, and will be reserved for subscribers alone. They will not be sent at this price to dealers. They are a great bargain at the price for anyone who wants to make a study of animal husbandry.

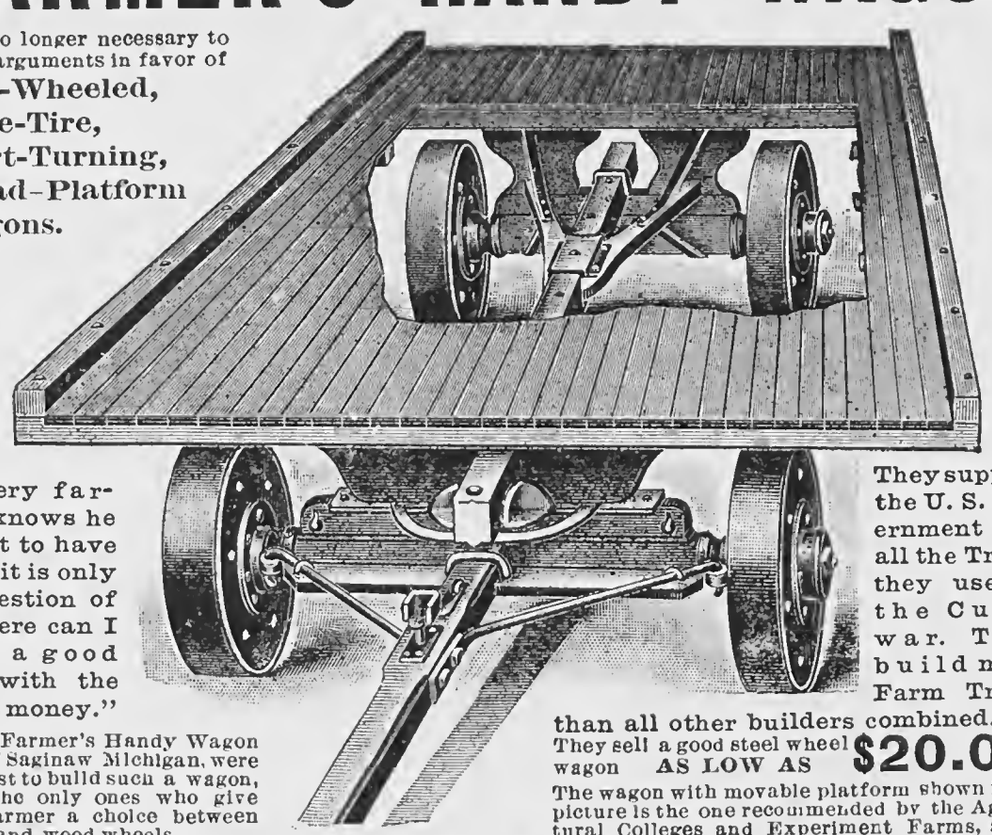
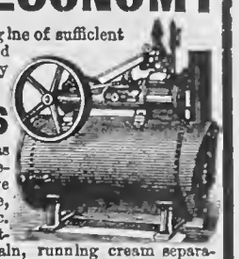
WELL DRILLING Machines
Over 70 sizes and styles, for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.
WILLIAMS BROS., Ithaca, N. Y.

FARMER'S HANDY WAGON
It is no longer necessary to offer arguments in favor of
Low-Wheeled, Wide-Tire, Short-Turning, Broad-Platform Wagons.


Every farmer knows he ought to have one; it is only a question of "where can I buy a good one with the least money."
The Farmer's Handy Wagon Co., of Saginaw Michigan, were the first to build such a wagon, and the only ones who give the farmer a choice between steel and wood wheels.
They supplied the U. S. Government with all the Trucks they used in the Cuban war. They build more Farm Trucks than all other builders combined.
They sell a good steel wheel wagon AS LOW AS $20.00.
The wagon with movable platform shown in this picture is the one recommended by the Agricultural Colleges and Experiment Farms, and is the only truck ever adopted by the U. S. Government. The platform is easily removed and stakes placed on bolsters, then it is ready for an ordinary wagon box. The wheels turn under the load. Send for Catalogue and prices.
FARMER'S HANDY WAGON CO., Saginaw, Mich.

POWER ECONOMY
consists first of all in having an engine of sufficient size to develop power cheaply, and large reserve force so as to run any machine easily and without drag.
Leffel Engines


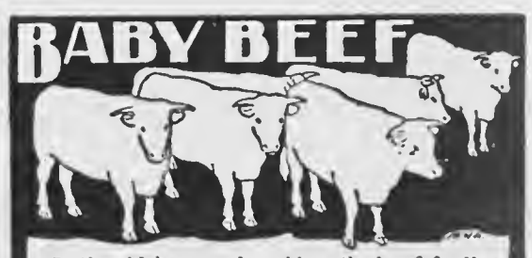
excel in these things as well as others. Quick, easy steamers, require the minimum of fuel and are easy to operate. Ideal for farm use, creameries, small factories, etc. Unequaled for sawing wood, cutting feed, shelling and grinding grain, running cream separators, churns, pumps, etc. This one is horizontal—we make uprights also. Stationary and portable, 3 h.p. up. Send stamp for book. James Leffel & Co., Box 101 Springfield, Ohio.

CYCLONE FEED AND ENSILAGE CUTTER
IT LEADS THEM ALL
Fitted with COMPOUND SPIRAL CYLINDERS

Choking is impossible. With and without traveling feed. For catalogue address
FARMERS MFG. CO.
Sebring, O.

Quality Counts
above everything else in an ensilage and dry fodder cutter. The quality of the machine and the machine itself;

quality of work and the ability to run with a light power.
THE GALE-BALDWIN and BALDWIN
are machines of known high quality. Cut 4 lengths of feed. Any length of elevator desired. Easy to feed and fast workers. Safety fly wheel and safety treadle lever—prevent all accidents. Send for free illustrated catalogue and look it over before you buy.
THE BELCHER & TAYLOR A. T. CO.,
Box 75, Chicopee Falls, Mass.

BABY BEEF


In the old days, under old methods of feeding it used to take 3 years to produce a beef. Improved methods, ground feed, etc., now do it in one year. "Baby Beef" has come to stay, Better buy a
SCIENTIFIC GRINDER

and get ready to make your share of it. They crush and grind ear corn shucks on or off and all kinds of small grain, separate or mixed. Send for catalogue R Mailed free.

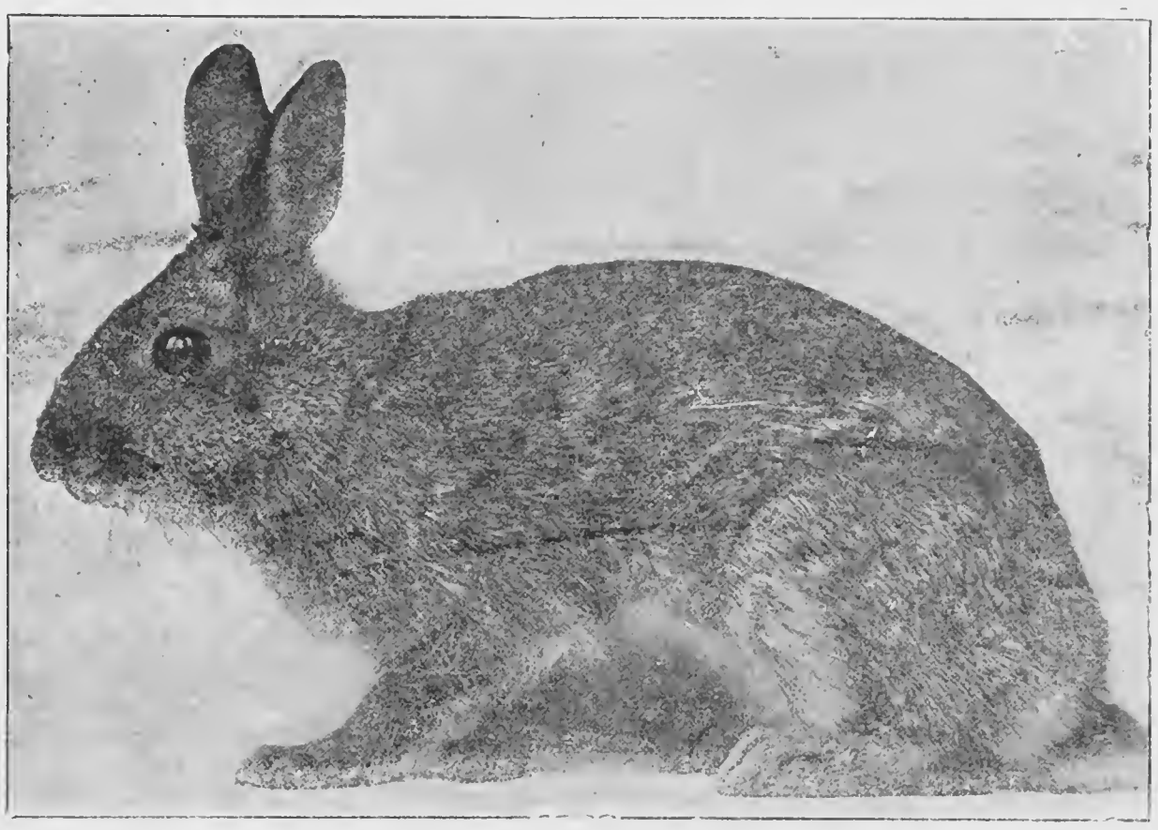
VOL. LX. No. 2695. NEW YORK, SEPTEMBER 21, 1901. $1 PER YEAR

HABITS OF THE WILD RABBIT.

ITS INJURIES TO FRUIT TREES.

What To Do With Them.

Prof. H. Garman, of the Kentucky Experiment Station (Lexington), gives in Bulletin 63 some interesting facts about rabbits. These little animals prove a serious pest in some parts of the country, as they gnaw the bark of young fruit trees, and even eat crops. The pictures shown in Figs. 284, 285 and 286 are taken from Prof. Garman's bulletin, as are also the following notes:



THE COMMON WILD RABBIT. FIG. 284.

In the more closely settled portions of Kentucky hunters and dogs keep the numbers so reduced that complaints of injury by barking trees are rare, but in sections where there is still a great deal of forest with undergrowth, hunting is not sufficient to keep them in subjection, and whenever snows are deep and other food becomes scarce, the trees suffer. I have examined nurseries in which 25 per cent of whole blocks of apple trees was so badly gnawed as to be worthless. When trees are from one-half to one inch in diameter of trunk the bark alone is commonly eaten, but they may be completely girdled for a distance of eight or 10 inches up the trunk. Very young trees (one-year-olds) are sometimes cut off by the sharp incisors as cleanly as if severed with a knife. Hunters cannot be given the freedom of a nursery, because of the damage done to trees by charges of shot. Dogs alone are not a complete protection. Other means are a necessity at times.

RABBIT-PROOF FENCES.—When the nursery is small it is possible to enclose it with a close slat fence that will "turn" rabbits. Two types of fence suitable for the purpose are to be seen in the State. The most common is made of rough slats four to six feet long and about three inches in width. The slats are securely fastened together from one to two inches apart with No. 11 wire, stout posts being set at intervals of 10 to 16 feet to insure stability and keep the panels upright. Since the slats can be adjusted to any unevenness of the ground, it is possible to exclude anything that a fence can reasonably be expected to turn. The second type is made of shorter slats, three or four feet long, and these may be supplemented above by one or more wires stretched from post to post. J. Q. A. Rahm has built such a fence about his nursery. He uses slats three feet long, none less than one-half inch thick and sets his posts in Spring; waiting until hot weather in August and September before putting up the slats, in order to have the wire fully expanded at the start. The wires are simply crossed between the slats, and are kept taut while building by a harrow loaded with about 1,000 pounds of stone and placed from 100 to 400 yards ahead of the workmen. Near the harrow the wires are secured to a singletree made of a piece of stout timber, a log chain being passed around this and secured to the weighted harrow so that it cannot slip.

A RABBIT-PROOF FENCE ABOUT YOUNG NURSERY TREES. FIG. 285.

TRAPS.—Rabbits are very easily caught, notwithstanding their well-known cunning. One of the simplest and best traps used for the purpose is made of rough fence boards six inches wide and about two feet long. These pieces are nailed together so as to make an oblong box, one end of which is closed with a short piece of board, while the other is provided with a door consisting of another piece of board which slides down from above in grooves cut in the projecting sides, or between slats nailed on to the end, as shown in Fig. 286. The bottom piece may also be allowed to project so as to make the door more secure when closed. A small hole is bored through the top at about the middle of the box, and midway between this and the door a stick is secured in an upright position. Across the top of this latter a second stick is secured, by a nail, in a notch made in the upright one so that it will see-saw up and down. A third stick of small size is notched near one end and secured at the opposite end by means of a piece of twine, to the end of the larger movable piece. This movable piece is now connected by twine at its forward end to the top of the door, when the trap is ready to set. The door is elevated, the little stick passed through the hole in the top and secured by the notch to the front edge of the hole. When the rabbit enters it pushes the projecting end of the stick before it, setting it free, allowing the suspended door to descend and thus cutting off its own escape. P. E. Downer, of Todd County, keeps numbers of these traps set among his young trees at all times during the Winter, catching scores of rabbits, and completely preventing injury from them. The traps may be baited with a piece of apple or cabbage placed in the the end farthest from the door, but rabbits sometimes go into them when no bait is used, either out of curiosity, or in search of shelter. They are very likely to take refuge in the traps when closely pursued by dogs. The traps can be taken indoors in Summer, and with this care will last for a long time. They should be made of old weather-beaten boards, as these are less likely than new lumber to arouse suspicion. I have seen traps of this pattern made by a 10-year-old boy that worked well, to the great delight of their owner.

A second trap sometimes used in the State is made of the same material as that described, but the door is hinged at the top and swings inward, so that when open it is against the top of the trap. It is secured in this position by a wire which passes through a couple of eyelets and is finally connected with a treadle consisting of a loose piece of board resting on the floor, by its front edge, while farther in it is raised by means of the wire connected with the open door. When any weight presses up on the treadle, the wire is drawn from beneath the edge of the door and lets it drop. Being somewhat longer than the opening it strikes the bottom of the trap in an oblique position, and any attempt of a rabbit to escape only wedges it the more securely. The hinges required may be made of bits of old leather. The wire commonly employed is that designed for fences. The common form of snare used in this State consists of a ring of small pegs driven into the ground so as to project about three inches, the pegs set one inch apart and the ring made about five inches in diameter. Then in place of one of the pegs a small figure-four is made, with the horizontal piece bearing an apple projecting to the middle of the ring of pegs. A sapling is bent down, a piece of chalk-line attached and the noose at its end is passed about the ring of pegs and connected with the figure-four, so that when anything disturbs the apple the noose is released and the sapling flies up.

RUBBING TREES WITH BLOOD.—Even in the nursery it is possible to go over blocks of trees during the Winter and rub the trunks for 1½ foot above the ground with blood from a slaughtered hog or steer, and those who have tried it claim that it is a complete protection against rabbit depredations. Sometimes a piece of liver is used, the rubbing being done in either case with the hands, these sometimes protected by an old mitten or glove. The practice does not commend itself to me as the best means of attaining the desired end, so far as the nursery alone is to be considered. In the young orchard the rubbing can be done with less waste of labor. Young orchard trees can be protected, however, by simply wrapping the trunk with closely-placed cornstalks, coarse straw or stout paper. Such wrappings are frequently employed, and I am assured by those who have tried them that trees so defended are never disturbed by rabbits, though it must be confessed there is no evident reason why they should pay heed to so flimsy a covering when their stout teeth could easily remove it.

HABITS OF COMMON RABBIT.—Our common rabbit makes a very attractive pet when captured, even after he is fully grown. But a wilder thing was probably never handled than an individual just taken from the trap. He comes as near jumping out of his skin as anything alive. His fright is pitiable to behold, and, mute that he is at other times, the wail he then sets up is enough to touch the heart of the most hardened and brutal. Much of his life is spent in thickets about cultivated fields, at the edges of woods, wherever suitable forage is to be found. His trust in his fleetness and cunning is such that he penetrates even into the edges of cities. During the day our rabbits remain on their "forms," which consist of slight depressions in the ground among grasses and weeds. Their colors harmonize so completely with their surroundings that they are very effectively concealed, and it is only when one stumbles on them, or when dogs nose them out, that they are started. They do not burrow, and are not much given to going underground, although they will dash into any hole or crevice that offers refuge when closely pursued. During very severe snowstorms they resort to brush heaps, and are sometimes surrounded here and killed in large numbers. In the Spring, often in March, when the weather is still cold, the female makes a little pocket, a few inches in depth, in the soil in some retired place, and lines it with the soft fur torn from her body. The young, which number four or five, remain in this snug retreat for several weeks, but soon run about, probably remaining in the neighborhood of the mother for some time later.

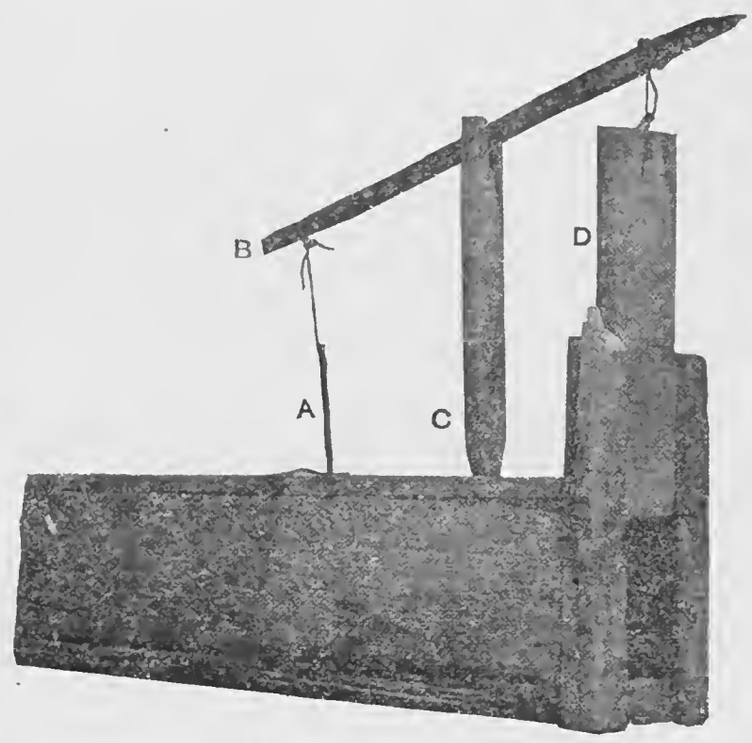
PORTO RICO FOR AMERICANS.

Fruit and Vegetable Growing.

VEGETABLES.—No portion of the United States domain offers such a profitable field for the employment of horticultural skill backed by capital as Porto Rico. Its wonderfully sunny Winters, with uniformly warm nights, make it superior to Bermuda or Florida, because absolute immunity from frost is secured. The writer grew tomatoes, egg plants and beans last Winter on a property near Jobos Bay, on the south coast of the Island east of Ponce, which demonstrated that this business is practicable under present conditions. In this experiment the seed was sown in December, four months too late, and a third of an acre each of tomatoes and egg plants were grown. Marketed in April and May the tomatoes brought $2 to $3 per carrier (30 pounds), and the yield was such as to warrant the conclusion that, starting operations at the proper time, the gross receipts should be from $800 to $1,600 per acre. Egg plants flourish luxuriantly in the Porto Rico Winters, and this crop is perhaps more easily handled than tomatoes by the gardener new to the climate. A wind-break of hills, or of trees such as bananas, should shelter the vegetable field from the prevailing trade winds, which, while very delightful in the shade, combined with the heat of the sun cause excessive evaporation in soft-leaved garden crops. These conditions make irrigation desirable for the most complete success, because while there is in many sections of Porto Rico an abundance of rainfall, there are frequently short droughts during February and March, which would prove disastrous in cutting down the yield. Intensive methods are necessary to grow vegetables successfully, and this is nowhere so imperative as where highly-developed plants are grown under the strong push of the tropical sun. The conditions are quite similar to those of the hothouse. Thorough fertilization, cultivation, watering and rigorous pruning of laterals are among the conditions requisite to insure success in growing tomatoes and egg plants to perfection in the West Indies. There are insects of course in Porto Rico as well as in the States, and the intelligent gardener will be provided with modern means for combating them. September, October and November will be the planting months for Winter vegetables in Porto Rico. Potatoes and onions should be planted at the close of the heavy Fall rains of October, on well-drained land, when they will succeed the best in the slightly modified heat and drier climate of the Winter months, ripening in February, March and April, when new potatoes command $7 to $9 per barrel, and new onions $1.50 to $2 per crate in New York.

PINEAPPLES.—It is doubtful whether a climate and soil can be found anywhere more congenial for the growth of pineapples than Porto Rico. They are found growing wild in old clearings throughout the Island, in situations where they have continued to grow and bear fruit, somewhat stringy it is true, holding their own in the wild growth of the bush. The deliciously sweet yellow-fleshed "par de azucar," or sugarloaf variety and the large white or "cabezonia," known in the northern market as "Porto Rico," are the varieties now chiefly grown. The latter, on account of its superior size and shipping qualities, is the better for commercial planting. This luscious fruit can be grown on a large scale in Porto Rico at the present time, as it is one which is simple in cultivation, and the market for the fresh and the canned product is immense. With good management they should yield a net profit of from $100 to $300 per acre, especially if a fine stock is grown.

ORANGES.—Orange growing, on account of the magnitude of the market in the United States, has naturally attracted more Americans than any other line of horticulture. Probably 50 Americans have started to establish groves on the Island, and during the present season more than ever before. One of the pioneers in this line, Gustavo Preston, of Boston, who was born on the Island, and has extensive business interests there as a sugar and molasses importer, was recently interviewed by a reporter of the Boston Herald, in the course of which he said that he bought 300 acres after the American occupation, and has gone into the fruit business in a modest way. His land is in the southeast end of the Island, well into the country among the real natives, five miles from the nearest village. He found it a good location for orange culture, many orange trees growing wild there. From one of these, 3,500 delicious oranges were gathered one season, which made about 20 boxes. The duty on these 20 boxes was about $16 (the rate is one cent a pound) and if an acre of trees (70) would bear as well the duty for the product of the acre would amount to $1,120. If Jamaica planters can make a profit from oranges imported to the United States, paying this duty, one can estimate the increased profits accruing to the Porto Rican planter. As for California and Florida fruit, the freight from these States to the market will average from 70 to 90 cents; but from Porto Rico to New York the cost is only 25 cents. He imported from Florida orange trees of different sizes, and secured others in the vicinity of his land, and set out in all about 10,000 trees. As one



A RABBIT TRAP COMMONLY USED IN KENTUCKY. Fig. 286.

has to wait several years for the first crop of oranges, he began the cultivation of several products well protected by the United States tariff, such as tobacco, rice and beans, which yield fair profits with small investments. This small investment for labor has greatly increased the comfort of the neighboring population, which he found to be an exceedingly lovable, tractable and grateful people, honest to a degree, and living in the same way their fathers did from the produce of their little plots of yams, sweet potatoes, plantains, etc. The district adjoining Bayamon, which is only a few miles from San Juan, has been up to now the favorite for Americans locating orange groves in Porto Rico, as it combines good soil and sheltered location with excellent shipping facilities. Every quarter of Porto Rico has soils and localities adapted to fruit growing, and better means of communication only are required to open up hundreds of thousands of acres of these in the hill country of the interior, which can now be bought for a merely nominal price. The southwest portion of the Island, the neighborhood of Mayaguez, is the district where the largest number of fine pineapples and oranges are now found growing, as climate and soil conditions are very favorable there, but at present the transportation facilities do not favor this section for exporting.

TOBACCO.—Tobacco growing in Porto Rico has a bright future, as there are many regions where the soils produce a high-grade leaf, similar to the famous vuelta abajo tobacco of western Cuba. Much of Porto Rico tobacco was formerly sent to Cuba, where it was recured and sorted and sold for Havana. Porto Ricans do not understand the fine arts of curing and preparing the leaf for market so well as their cousins, the Cubans, and just now are not prepared to take advantage of the enormous tariff bounty which they possess in this great industry.

CANE.—Cane growing for sugar, molasses and rum manufacture, under a highly favorable tariff, is now enormously profitable in Porto Rico, but not over 10 per cent of the lands, the rich alluvial soils of sea coast and river valleys, are suitable for this business. Cane growing to be profitable must be conducted on an enormous scale. It is said that over $1,000,000 has been invested in the land, railroad and new sugar plant of the De Ford Company on Jobos Bay, Porto Rico. Under such circumstances the sugar industry offers a few situations to efficient young men who have executive ability, and some knowledge of Spanish, but only the very wealthy can engage in it as proprietors.

COFFEE.—The coffee business was already in a depressed condition on account of low prices to the grower, when the American occupation brought a rise in the duty in Spain and Cuba. This was followed within a year by a desolating cyclone, which destroyed the branches of the coffee trees throughout a large portion of the Island. The coffee growers are many of them ruined, and little work has been done on these properties, because most of the growers are in debt. These sad conditions are among the causes of the suffering of the laboring classes in the interior of Porto Rico. As coffee is on the free list there is no advantage in growing this crop in Porto Rico over countries beyond the control of our Government. Probably in time much land now devoted to coffee may be planted to fruit and vegetable crops which produce a higher value per acre. This can only be done, however, as better roads and railroads penetrate the interior coffee districts. As Americans come in to develop the waste places of Porto Rico, and as labor becomes more intelligent and proficient, the minor products of the Island will be more and more exploited, and the crops more and more diversified. New industries will spring up, based on utilizing the products of the soil, and those already started, such as the manufacture of cigars, cigarettes, hammocks and hats, etc., will be systematized and extended. Porto Rico will become a delightful Winter garden for the United States, the home of the fruit grower, and the favorite haunt of the tourist seeking Winter diversion.

F. A. PENNOCK.

SUCCESS WITH COW PEAS IN DELAWARE.

The present season has been a record breaker all along the line. In July and early August we had the longest continuous spell of high temperature within the memory of the oldest inhabitant. Accompanying this were frequent rains and a high degree of atmospheric humidity. These were just the conditions requisite to produce the highest development of the corn and cow-pea crops, both of which have a prominent place in Delaware agriculture. I have been growing cow peas for 12 years past, and have often secured very heavy crops of them, but I do not remember a year when the growth has been so uniformly rank and heavy as it is this season in every field I have seen. The Mt. Olive and the large early black varieties have long been great favorites with me on account of early maturity and bush habit of growth, at the same time producing as heavy crops as can be comfortably turned under. But they have grown this season as never before, and I should not recognize them at all from appearance of the vines. My field of Mt. Olive is a sight to behold; planted in rows 32 inches apart they completely hide the ground, and by actual measure the vines are over four feet.

I have completed cutting a field of Early Black for hay. It was in my pear orchard of standard Bartlett trees, and had occupied the ground only 70 days. The plants were well podded, and a few pods had ripened. A pair of Norman horses and a strong McCormick mower were used, and of all the tough jobs I ever had cutting hay, I think that was the toughest. Many of the vines were over 10 feet in length, and tangled and twisted in every direction. The first "through" in each space between three rows wes especially difficult to cut, and I had to stand up on the machine in order to see where to drive. By keeping the team on a lively walk I could sometimes cut several rods without stopping, but more often would not get more than one or two rods before the guards would load up with vines and leaves, necessitating a stop. The "divider" failed to divide, but slipped along under the mass of vines, and the only guide I had was the impress of the wheels made the previous round. The next thing is to cure it properly, retaining the leaves. This I hope to do, as the weather is fine, and promises to continue so. I fed six tons of excellent cow-pea hay last Winter to milch cows and work horses with grand results. Out of 76 acres in my farm, 24 acres are now in cow peas. Twelve acres of them will be limed and plowed under in October and sown to rye, which in turn will be plowed down next May, and the field planted in corn. This treatment I expect to give as good results in the corn crop as a heavy dressing of stable manure. I have no failures with cow peas. I always use good seed, and plant or sow them in June or July, when the soil has become thoroughly warm. Early sowing, April or May, will result in failure. The cow pea is a hot-weather plant and must have proper conditions to thrive. Crops are generally good in Delaware this season, and are bringing very satisfactory prices. Peaches were never finer in color, size and quality. Quite a number of farms have been sold recently to northern and western farmers, who are finding out the advantages of climate, healthfulness, soil, location, etc., offered by Delaware.

E. G. PACKARD.

USING THE FARM ROLLER.

The roller is an implement which should be upon every farm, and yet if it is used without an understanding of its operations it may be productive of harm instead of good. Now that land is being prepared for wheat the farm roller should be hauled from its resting place, and should be used in fitting the wheat ground. Ordinarily the roller is looked upon as an implement with which to crush clods, and with which to press the stones into the ground upon the meadow land. But when used upon wheat land it becomes something more than a clod crusher. It compacts the surface soil, it firms the seed bed, and as a result of its action upon soils the harrow is made far more effective in its action. That this last statement is true can be easily proven if one will take a freshly plowed field and roll a portion of it before harrowing. The truth of the statement is especially seen on sandy or loamy soils. By the use of the roller the surface particles of soil are pressed closely together, and surface capillarity is greatly increased. A short time ago in conversation with a farmer who was rolling a piece of plowed land, I asked him why he was rolling the land. He replied: "I do not know; to make it more moist I suppose." He had noticed that where the soil was compacted at the surface it was darker in appearance, indicating that the moisture was rising from below. It had never occurred to him, however, that the moisture was passing off into the atmosphere and was being lost from the soil. It should be made a principle in farm practice that whenever the roller is used upon plowed land it should be followed with the harrow so that the surface soil may be again loosened and the escape of moisture be prevented. See Fig. 287.

Where the roller is to be used at the time of drilling in grain, the roller should precede the drill. After the plants have appeared above ground and are from one to two inches high the roller may be frequently used to advantage. It serves to firm the soil about the plant roots, and gives them a firm contact with the soil; it pushes the small stones which may be upon the surface into the ground, and thus prepares the way for the reaper or mower. In fitting the land for wheat this Fall the roller should be used to firm the subsurface soil, for wheat does best in our latitude when made to feed near the surface of the ground in the Fall. A precaution which should always be observed is never to roll land when it is so moist as to be sticky, for then harm will be done. Sandy, gravelly soils may be rolled often, but the harrow should follow soon after. L. A. CLINTON.

A MYSTERIOUS BEAN TROUBLE.

I mail you under another cover some beanstalks, as specimens of the work done by some insect, the grub of which I think you will find in some of them. I could not find the insect that lays the eggs, but perhaps you can tell what it is. They do the most damage in the best beans; the eggs are laid from the surface of ground up to the branches, and sometimes where the branches join the stalk. When the pods get heavy, they bend over and break the stalks, and the beans wither up. I have seen a little fly, like the Hessian fly, in the field, but do not know whether they are the guilty ones.

Shortsville, N. Y. J. R. W.

Bean growing has come to be a very important industry in western New York, and until this season we have had few complaints of their being seriously injured by pests or other troubles. But during the past month reports have come in from several localities that the bean stems were being cut off by some insect, so that the top of the plant, with its pods, fell over and shriveled or died. From the specimens of the stems sent to us we were unable to diagnose the trouble. We were wishing for a favorable opportunity to inspect some of the injured fields when J. R. W.'s query came in with one or two others the same day. We at once went to Shortsville, and made a close inspection of the field conditions. In Fig. 288 are pictured some of the injured stems that we found. The common white beans usually were not affected noticeably, but the Yellow Six-Weeks kidney beans often suffered seriously. Some of our correspondents report that it is the work of a maggot or grub, and once in a while a broken stem will be found in which there are a few minute maggots, but we are quite sure that the little mother fly was attracted to the spot by the decay or rot going on; hence the maggots are not the cause, but may be secondary accompaniments of the trouble. Some thought that it was the work of the Hessian fly, but no trace of this insect can be found in or about the stems, and it has never been known to attack beans. Others found many large black beetles on and around the plants. We found these also, and as they are ground beetles which feed upon other insects, and sometimes on the seeds of weeds, we are sure they have nothing to do with the stem trouble. In fact, the general appearance of the break indicates that it is not the work of a biting or chewing insect, like a beetle or a cutworm. We doubt whether any insect has any connection with the trouble, but it is possible that a sucking bug may, in puncturing the stem, so poison the wound as to cause a cracking of the stem, which would let in rot spores; this is scarcely probable, however.

We noted that the stems always broke over at a joint, and there was always more or less rotting of the tissues at the break, and often at other joints above. Growers state that in many cases the fields were so wet that they could not cultivate down the weeds, so that with the shade of the weeds and the continued wet weather the bean fields are reeking with just those moist conditions which are most favorable for the growth of the rots and other fungi. In many cases, also, it is said that the beans have grown too fast, so that the stems may be weaker and the tops heavier than usual. Thus, when the stem was weakened at a joint by a wound or rot, the swaying of the heavy top might easily cause the break, which suggested insect attack.

From our observations in J. R. W.'s field we believe

FITTING GROUND WITH THE ROLLER. Fig. 287.

that the trouble is largely due to the above unusual natural conditions, aided by some rot disease. The trouble seems to begin in a slit or crack in the stem at a joint, as shown on the stem marked A in Fig. 288. Whether the unusual conditions of quick growth cause this first slit in the skin of the stem or not, we cannot say with certainty; we do not believe it was done by an insect. But some disease or rot spores apparently soon find this ideal place of lodgment, and chance to work in the tissues, and a rot begins which weakens the stem at a joint until the heavy-topped plant in its swayings at last breaks the hollow stem. Sometimes the rot continues and girdles the stem at the break, and the top of the plant shrivels and dies. Oftentimes, however, the break is not complete, and the top, bent over on to the ground, continues to get enough sustenance through the other unbroken side to enable it to mature its crop, so that but little damage is done. From what we saw, we are inclined to believe that if there had been less moisture and weeds in the injured fields, but few of the stems would have broken over. Too much moisture and too fast a growth, which induced unusually favorable conditions for rot spores and other

BEANSTALKS BROKEN BY ROT. Fig. 288.

fungous troubles, seem to us to be the principal causes of this new and widespread bean-stem trouble.

M. V. SLINGERLAND.

WHAT GOOD APPLES MEAN.

I am thankful for remarks on page 566 on Baldwin apples in New England. I have never seen or heard of any apple of its season as good as the Baldwin, grown where it belongs. All these Winesaps, Ganos, York Imperials and the host of other red apples make me long for a good Baldwin when ours are all eaten, and I have to buy in the market. And there is a turnip apple, the B—— D——, and a turnip pear, the K——. How can these claim any better place in the list of products than oleomargarine? They ship well and they look well, and they are not what they seem. I imagine St. Peter has many a surprise in store for the man who cries fraud at oleomargarine, and plants and ships fruit to market which looks like good honest flavor and is not. Our fruit stands in the great cities all Winter are loaded with this wretched stuff, which no sane man would ever buy twice, and many have to throw away when bought. The result is that but few of our 75,000,000 people eat apples. We are six in my family, and all enjoy good health, thanks to an apple orchard my father planted, Baldwins, Russets and Greenings, down in Rhode Island. We never sit down to any meal without baked apples or apple sauce on the table, of which all partake three times a day, 365 days a year, as freely as one would eat bread or potatoes or drink milk. We always keep a barrel of apples open in the cellar from August 1 until strawberries come in. All the children eat all they want whenever they want, morning, noon and night. I personally will easily average four to five raw apples a day for 10 months of the year.

Why do we do this? Because we have been taught to know what apples have good flavor and are digestible. I could not eat two King or Porter apples in succession; they are not digestible. But Baldwins, Greenings and Fall Pippins are. Now I wish some of your readers who are planting B—— D—— apples which no one can eat, would think what it would mean to their apple market if one-half our population were as well posted on the food value of apples as I happen to be, and I wish you would take this question up on its merits—and as long as fruit is shipped solely on its looks and keeping qualities, teach those men who ship it that that is precisely what oleomargarine comes in on. W. B. W.

APPLES IN CALIFORNIA.

We are feasting on apples this year. Red Astrachan, our earliest variety, came along about July 4, followed quickly by Yellow Harvest. As there were more of these than we could use, we made some cider, but found it too poor to use. Next to ripen was Wealthy, about August 1. Wealthy is a very acceptable early apple here, always bearing some, and generally a good crop of medium-sized tender juicy apples, and besides, I have a soft spot in my organism somewhere for the originator, Peter Gideon, having known him in my boyhood days, and how he found only one good apple out of 10,000 seedlings, and named it Wealthy. Out of my boyhood's earnings I paid $1 for a Wealthy tree only about a foot high, and planted it with great expectations in a choice place in our garden in the suburbs of Minneapolis. The place where it was planted is now covered with buildings, but my expectations are realized here in California. August 8 I picked one apple from a two-year-old Red Harvest tree in the experimental orchard. It was a better apple than the Yellow Harvest, and will doubtless come earlier when the tree is old enough to bear a crop. August 9 I picked the first Gravenstein, and we are still eating this most delicious Summer apple. While the Gravenstein has the fault of bearing irregular crops of various-sized apples from the size of crab apples up to four inches in diameter, its fine quality makes it a very desirable apple for the family orchard. Its thin skin and small core are good recommendations, and I write from practical observation, for to me falls the pleasant task of preparing the apples for table use. The next apple to ripen is the Skinner's Seedling—called by some nurserymen Skinner's Pippin. This apple is now in its prime and is in demand for eating from the hand, cooking, canning or drying. It is very tender and thin-skinned, but has a rather large core. It originated in this county and is named for its originator. The tree is a strong healthy grower and is one variety that resists the effects of Paris-green spray excellently. In my experiment orchard several varieties are bearing enough apples this year to give a test as to quality. Stark has borne two crops, and although large and attractive, the quality is poor. It will probably be one of many to be grafted to some more desirable sort. Arkanasas Black and Delaware Red produced a few apples last year and this. They do not promise well, but will have a fair trial.

We have few worms this year. We sprayed three times, and now have bands around the trunks of the trees, which we examine every week and destroy the worms found there. We have found that the foliage of some varieties is very tender and easily injured by Paris-green, Jonathan and Newtown Pippin showing the most injury in our orchard. The windfalls are picked up every week, the best ones are used for drying, and the poorest sent to the hogs. A few weeks ago I passed through the famous apple district near Watsonville, and saw evidences of a large crop of apples. The varieties raised are almost entirely Newtown Pippin and Yellow Bellflower in the proportion of three of the former to one of the latter. These apples are almost all of them shipped to eastern markets and to London. Prices paid by the buyers range from 80 cents to $1 per box on the trees for sound apples large enough to pack five tiers in the box. These prices yield handsome profits to the owners of apple orchards. H. G. KEESLING.

Treatment of Old Pear Trees.

P. G. S., Morton, Pa.—I have about a dozen old pear trees between 50 and 75 feet high, which have been growing wild for years by the looks of them. This year they bore no fruit. They are, I think, Catharine and Seckel. Are they of any use? Could they be pruned so as to bear within a year or two? If so, describe treatment for same.

ANS.—It would be impossible to give positive advice regarding the proper thing to do with these old pear trees without seeing them, but if they are in healthy condition it is quite probable that they would be valuable when grafted. I have set grafts on pear trees fully 40 feet from the ground that nourished and bore fruit abundantly in after years. I think, however, that it is a mistake in believing that any of these trees are Seckel, for this is one of the best varieties known, and would certainly bear abundantly under anything like proper treatment. It would be unwise to haggle the trees by severe pruning and this sort of treatment would not be likely to make them bear, but rather to make them produce a lot of new wood that would only bear after growing two or three years. If the trees bear worthless fruit the grafting would cause them to bear good fruit. The proper thing to do, in my opinion, would be to get some person who has a good knowledge of pruning and grafting to look at the trees and then decide what to do with them. H. E. V. D.

How Raisins Are Dried.

H. H. C., Nelson, N. Y.—Describe the process of raisin making. What varieties of foreign grapes are used for that purpose? What varieties of our native grapes would be best for raisins?

ANS.—There are a number of varieties of the foreign class of grapes which are used for making raisins. Among them is the Muscat of Alexandria, which is the principal one used. It is a large green, or yellowish green grape, and the bunches sometimes weigh as much as two or three pounds before they are cured. Being of a light color before they are dried they make quite a light-colored raisin. The Sultana is a variety of the same color and makes even a lighter-colored raisin, but the berry is smaller and without seeds. There are a number of other varieties which I might mention which are used for raisins, but these are the leading kinds. All of them must necessarily be meaty in character and not simply skin, juice and seeds, as nearly all the grapes are that are grown in the Eastern States. None of this latter class will make raisins, as there is not enough flesh about them, and it would be useless for anyone to undertake to dry them. They are rarely grown in California or any of the other States beyond the continental divide, because there they can grow the richer and more valuable varieties such as have been described. In making raisins the grapes are picked upon trays in the vineyard, and in many cases are left right there to go through the first stage of drying. Sometimes they are taken to a special drying ground, and the trays there spread out to the influences of the sun and air. In either case they are partially dried by turning them over from time to time and are finally taken to a curing house which is built for this special purpose, where they are brought to the proper state of dryness and then packed. Quite recently there has sprung up an extensive business in seeded raisins. By this method all seeds and stems are removed, and only the valuable part is packed and transported to the market. This is a great saving, because by the old way there were many thousands of tons of seeds and stems sent to market, which were not only useless to the consumer, but very troublesome as well. H. E. V. D.

Small Fruits in Connecticut.

H. C. M., New Haven Co., Conn.—1. Some nurserymen are offering stock of raspberries and blackberries, in fact almost all nursery stock, for Fall planting. Is it advisable to plant raspberries and blackberries in the Fall, especially blackcaps? I have had some difficulty in getting raspberries to succeed with Spring planting. Would Fall be the better time? What protection is necessary for stock set in the Fall? 2. Will you give a list of profitable varieties of blackberries, those in use by commercial growers? 3. What is the best way to treat a blackberry plantation on a light, gravelly soil, to grow paying crops of fruit? 4. What is the best mulch to use on spinach during the Winter? 5. Do you recommend mulching the strawberry bed with coarse stable manure in the Fall? Will it not be likely to seed the ground with too many weeds? 6. Are the improved dewberries profitable commercially in New England? What is the best method of culture?

ANS.—1. In Connecticut it will do very well to plant raspberries and blackberries in the Fall, but I would advise to mulch them so they will not be heaved out by the Winter freezing. So treated, they ought to do very well over a large part of the Eastern States. 2. Among the most popular blackberries are Erie, Minnewaska, Agawam and Snyder. The latter is small, compared with the others, but very hardy and productive. 3. It would be necessary to manure light sandy or gravelly land very highly in order to get the best results from blackberry bushes. Plenty of coarse manure of almost any kind will add humus and fertility as well to the soil. Mulching with the same kind of material from year to year among the plants in the rows will be a great benefit; for this will help to retain the moisture in the soil and maintain the fertility. 4. A very light covering of marsh hay will be as good a mulch as can be used for spinach during the Winter. I have used pine needles for this purpose, but they cannot be as easily obtained in Connecticut as marsh hay. 5. Coarse stable manure makes a good mulch for strawberries, provided the forage from which it is made is not full of weed seeds. That made from wheat or oat straw or corn fodder is likely to be quite clear. When Timothy hay is fed there are likely to be many weed seeds, and the grass seed is also troublesome when it grows. 6. Lucretia is about the only variety of the dewberry that is generally acceptable to the commercial growers. It is large when properly grown, and comes in before the true blackberries begin to ripen. Mayes (sometimes called Austin) is another large and well-flavored variety, but it is too soft for general use. Both these varieties or any others should be lightly covered with coarse litter during the Winter, and tied to a trellis of some kind during the rest of the year. Windom is also a fairly good variety. H. E. V. D.

Peaches in the Cold North.

W. C. G., Victoria, B. C.—You have told lots about peach growing in THE R. N.-Y. of late. There is one point yet that I would like to know on which you did not touch so far as I noticed. Is it too cold for the peach to do well where the night temperature falls to 45 degrees during the growing season? What temperatures are considered most suitable to the peach?

ANS.—As long as the temperature keeps above freezing the minimum may be disregarded. I do not think it is a matter of minimum temperature during growing season which settles such questions as this. It is rather a question of *total Summer temperature.* If the total amount of heat received during the growing season is sufficient to ripen the peaches, and is fairly well distributed, an occasional low temperature will not spoil the result. Looked at this way, it is equally impossible and unnecessary to determine what are the optimum temperatures for the peach. It is not so much a question of whether the thermometer occasionally goes too high or too low as it is whether the days are warm enough month after month. It is a study of climate in all its factors, and extending over a long period. It takes experience in a given locality to tell whether it is a good peach section or not. Meteorological observations are very doubtful guides. The foregoing statements answer the question, I believe; but I would like to add the more practical information which seems to be what your correspondent wishes. In all probability peaches of the hardier varieties can be grown at his place. We grow a good many peaches in Vermont; and our Winter temperatures sometimes go as low as 30 degrees below zero. (Here's where a minimum temperature observation really comes in.) Peaches can be grown farther north than most persons suppose; but they are suitable only for the family garden, where they can have special attention, and where the grower does not expect to sell the fruit at a profit. F. A. WAUGH.

Vermont Exp. Station.

How to Move Large Trees.

J. C. D., Sodus, N. Y.—I have a pine tree about six inches in diameter which I wish to transplant. Will you tell me the best way I can move the tree?

ANS.—A tree six inches in diameter should not be too large to move, but much depends on the species. An evergreen of that size would need to be handled more carefully than a deciduous tree. Probably the best plan would be to wait until the ground is thoroughly frozen. Then cut a trench around the tree, not less than three feet from the trunk, and preferably four. Dig down through the frozen soil and undermine the cake of earth, which should not weigh much more than a ton for a tree of that size. It can then be skidded up on a strong sled and moved to the place selected for planting. The excavation to receive it ought to be a little larger, and, possibly, a few inches deeper; but the tree when set should on no account stand much deeper than it grew. The tree should be severely headed back, taking away at least one-third of the top, and should be well supported with guy ropes or wires, using old rubber hose around the tree, to prevent swaying in the wind until well established. If it is not feasible to wait until the ground is frozen, the tree may be moved as soon as the leaves have fallen, or any time in the Spring before the new growth starts. In that case, start digging four or five feet away from the trunk. As fast as the larger roots are exposed follow them up a foot or so further, cut them off cleanly, and at once envelop in wet bagging or burlap. Undermine the tree and pull it over to one side, protecting the roots with wet cloths. In this manner the tree may be handled and then loaded on a wagon or strong sled, and taken to the hole prepared to receive it. In planting it out, work the soil very firmly around the roots, hammer it well, and fill the main part of the cavity with rich surface soil. It should be stayed with wires the same as a tree set when the ground is frozen, and also headed back. The after treatment consists in keeping the soil moist and as well cultivated as a flower bed during the first growing season or two. A good plan is to keep the soil loose and well cultivated until about July, and then mulch heavily with old hay or straw after a rain. After the second season there is little danger of losing the tree. Pine trees may be safely moved as late as May and seldom need much pruning.

Clover for Seed.

C. I., Rochester, N. Y.—We have 10 acres of clover which we do not need for hay or pasture, and which is a fine crop. Our plan is to cut it for seed and put the straw after thrashing into the barnyard. Some of our good friends claim that it will be more value to the land to let it fall down on the ground this Fall, and plow it under in the Spring for potatoes than the clover seed will be worth. We can't see why it should be worth so much more to lie on the land this Winter than it will be put into the yard and drawn out on the same land this Winter or Spring. We do not intend to pasture the land in the Spring, but let the clover get as big as possible before plowing. Will not plow it until about June 1.

ANS.—Our plan would be to cut the clover for seed and let sheep and other stock pick over the straw or haulms, and then use it for bedding or in the manure. We think that would pay better than to let the whole crop rot down.

What is the "Center of Population"?

Several Readers.—We read of a certain point in the country known as the center of population. What does that mean?

ANS.—It may be called the center of gravity of all the population of this country. Suppose there are 79,000,000 people in the United States, scattered from the Atlantic to the Pacific. If we assume that each person has the same weight, and the whole country were a level plane, there would be some point where the whole thing would balance exactly. This point is now in southern Indiana, about six miles southeast of Columbus, in Bartholomew County. There is really no practical significance to this center of population, except that it indicates its change or transfer.

EVERYBODY'S GARDEN.

FAIR EXHIBITS ONCE MORE.—As creditable exhibits mean extra effort, and much previous preparation is always necessary, it is always well to begin in season. The rules governing exhibits in which you desire to compete should be well in mind, and, if possible, exclusive space for staging will be far more satisfactory than dispersing your entries. Obtain neat cards, mark each variety plainly, and tie to the package with baby ribbon. White plates or platters are best, and should be used in preference to baskets or other packages, except where too large amounts are specified in the rules of competition. Ordinarily the rules of societies prohibit the names of exhibitors appearing on their displays, and this is correct, as eliminating one element, at least, of seeming favoritism, so then contestants' names should only appear in the private record books of the society, and never on the displays. Attention to these points will greatly facilitate the labors of the judges, and go far in bringing such carefully-prepared work into favor.

TYING UP TOMATOES.—The experience of this season more fully than ever demonstrates the necessity of growing the tomatoes up off the ground. In thin light soils where heavy growth of vines is not likely, the damage of course from rain and wet ground will be far less than with rank-growing vines. Our loss will be large this year, from recent heavy rains and excessive growth of vines. In large areas, staking or trellising is doubtless, under general conditions, impracticable; it can always be done, however, in small gardens, and is usually the safer plan. A heavy mulching with straw or coarse litter applied before the vines fall down will to a large extent prevent the damage by decay. Pruning and tying up will not, evidently, give as large a number of fruits, but they will be larger, fairer and less liable to rot than when allowed to lie on the ground, and often be pressed and crowded out of shape by the weight of the vines resting upon them. Opinions of growers differ widely upon the subject, but the above seems to be a reasonable view.

SEED CORN.—For the sweet corn seed I am this year selecting only from stalks bearing two well-developed ears. This selection will reject many very fine ears growing singly on the stalks, but the double-ear theory will be strictly adhered to, and results carefully noted.

LIMA BEANS.—Although coming this year much later than usual, the Lima beans are here, and bring with them their usual share of good cheer. With us, Burpee's Willow Leaf is proving the earliest of the bush varieties, and holding its record as an immense cropper. The pods are smaller than are some other varieties, but abundant as to number, and always well filled with beans, pure white in color, and second to none in flavor. The bush itself is a novelty, being very ornamental, and with leaves almost identical in shape with the willow. If we mistake not, this will prove a valuable general-purpose sort, either for large or small gardens.

PREPARING FOR FROST.—In many localities frost may now be expected at almost any time, and some protection for the tomatoes, squashes, etc., will be in order. Tomatoes require and should receive special attention, as one or two heavy frosts will usually send prices up with astonishing rapidity. It is not at all uncommon for prices to advance 50 cents per bushel or more within a few hours, and hence it is exceedingly satisfactory if provided with a supply to meet these upward prices. Watch the weather closely, and pick the tomatoes before being frosted, carefully rejecting all specked or otherwise unsound fruits. It is utterly useless to waste time with any that are decayed in the least, as they will only destroy the good ones. Place a thick layer of straw in the hotbed and pack the tomatoes in layers with the greener ones at the bottom. Put on the sash, which will not only protect from storms, but also hasten the ripening, but while thoroughly protecting from rain they must also have plenty of ventilation. Care in handling will mature the fruits, even if placed in when very green. The cellar, if perfectly dry, will also mature the fruits nicely, but they should not be piled, but spread out thinly on straw if the cellar bottom is at all damp. In this way tomatoes may be kept in very good condition until late in November.

Pumpkins and squashes may be carried through quite severe frosts without injury, by covering well with straw or coarse litter. With especially fine hills, which may not have fully matured, it will usually pay well to do this, as they will often make very decided growth after the surrounding vines which were unprotected are dead beyond any hope. Four years ago, some very large pumpkins which I was growing were in danger of being killed by frost before maturity. They were intended for show windows in some of the large stores, and my object was the largest possible growth and thoroughly matured fruits. They were carefully covered, fruits and vines, and came through without injury, and kept growing vigorously until the second frost came, which killed the leaves and leaf stalks. At this time the pumpkins only were covered, the vines being left to care for themselves. But being very large and strong, the main vines still remained green, and the pumpkins by actual measurement made very decided growth after everything but the main stems was dead. Did all this trouble pay, do you ask? I think so, for the pumpkins were sold at satisfactory prices for the purpose for which they were grown, and the cards upon them with the grower's name and residence were a good advertisement. Cabbage, celery and all late-growing vegetables will be greatly benefited by a liberal use of the hoe and steel garden rake to loosen and fine the soil, and admit the air and sunshine. J. E. MORSE.

Michigan.

Alfalfa in Orchards.

We have noticed in several orchards of western New York mixtures of the clover and turnip seed sown in orchards as a crop to follow Summer cultivation. In most of these mixtures Alfalfa has taken the start, and its plants are readily noticed. Some authorities say that Alfalfa should never be sown in an orchard, and they give good reasons for it. Prof. John Craig explains why the Alfalfa was used.

ANS.—I have advised the use of Alfalfa as a cover crop in orchards. It was on the understanding, however, that the crop should be plowed under early next Spring. I do not think that it would be a desirable crop to introduce in an orchard on the perennial basis, but on the annual plan I think it possesses many desirable qualities. As a matter of fact the character of the plant cuts very little figure under the present system of orchard cultivation as practiced in western New York. The cultivation is so thorough in the early part of the season that the plant used for cover purposes, whatever its proclivities may be, is bound to be eradicated. I have used Alfalfa for this purpose in several orchards, and have had no difficulty whatever in turning it under. I have been advising mixtures of Alfalfa and peavine, Crimson clover and cow peas, peavine and cow peas, etc. Twenty-five or 30 men in the State are trying some little experiments along these lines.

JOHN CRAIG.

How and When to Bud Fruit.

G. B., River View, N. Y.—When should I bud all kinds of fruit trees? When should the buds be cut, and how are they set?

ANS.—Fruit trees are generally budded in August and early September, though the work may be done any time when the stocks peel freely and the buds are fairly developed. The buds should be cut when plump and fully formed, while the leaf is still firm. June budding is successful if the stocks are large enough, and firm buds can be found. As a general rule buds should be used as soon as possible after being cut, but may be kept some time by covering the branches with damp moss in a cool place after trimming off the leaves. To set buds first clear the necessary space on the stock from leaves, branches and loose bark, make a horizontal cut a half inch or so long about the stem just through the bark, and a downward cut from the middle of the first somewhat longer, the two cuts joining like a capital T. Lift the angles with the edge of knife and slip the shield-shaped piece of wood and bark carrying the bud under the raised edges, pushing down until snugly in place. If the stock is in the right condition the bud will peel up the bark readily as it slips down. When in place tie tightly with damp raffia or similar material, covering all the cuts to keep out wind and rain. The buds should be examined within two weeks, and the bandages loosened or removed if the bud has grown fast. Nearly all fruit trees may be successfully budded, in the following order of facility: Peach, apricot, plum, cherry, quince, pear and apple.

Some Experiments With Wheat.

Last year I sent you a brief account of a new variety of wheat I was developing, and its peculiar behavior. It began with a single stool of wheat which I found among my Dawson's Golden Chaff in 1898. My attention was called to it by its heading out above the Golden Chaff wheat, and a week or so earlier. I saved and planted it by itself that Fall, and at the harvest of 1899 I saved from it 1½ pound of the most mixed lot of wheat I ever saw. Every kernel that I sowed was red wheat, but I harvested some white, some red, and every shade between the two. I called it a sport, and assorted the wheat, putting the pure white kernels by themselves, the pure red by themselves and the intermediate grades in a third parcel. These I sowed again, each parcel by itself, and in 1900 harvested about one bushel in all, but with the same result as before. In each parcel I got a mixed result—white wheat where I sowed only red, and red wheat where I sowed nothing but white, all mixed together with intermediate shades. There was also a marked difference in the shape of the kernel between the white and the red—the white being shorter and plumper, or rounder than the red. I made up my mind that it was useless to try to separate the varieties, especially as there was but a small proportion of white wheat among it at this time, so in the Fall of 1900 I sowed it all together in a piece of corn ground, which was fitted by dragging it with a spring-tooth harrow, and without fertilizer of any kind. I have harvested from it 17½ bushels of an almost pure red wheat, which weighs 63 pounds to the measured bushel. I have set aside six bushels to sow this Fall on corn ground, which I shall give a better show than I gave it last year, and have had the rest ground to test its milling qualities. It is a bald red wheat, which ripened this year a week earlier than Dawson's Golden Chaff sown the same day in the same field. It has a strong stiff straw, and withstood the attack of the Hessian fly remarkably well. The flies were plenty in it, as they were in all the wheat in this section—many fields of which were never harvested. Under the circumstances I consider the yield of 17½ bushels for one bushel sowed on less than an acre of ground a remarkably good one. The reports from our miller and baker are so far very favorable. F. HODGMAN.

Michigan.

BULBS 25 For cents **BULBS**

we will send you, postpaid, the 25 bulbs named below:

3 **Roman Hyacinths**, white, rose, blue.
6 **Mixed Tulips**, extra-fine mixture.
3 **Narcissus**, all different.
10 **Crocus**, mixed colors, mammoth bulbs & flowers
3 **Freesias**, large bulbs, white flowers.

These are all good sound strong bulbs. Our Fall catalogue of Trees, Plants and Bulbs free with every order. Order now to secure this offer. Send us name and address of friends who may need trees, seeds, plants or bulbs with your order, and we will put in some extras that will please you.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

FIGHTING THE MELON BLIGHT.—Gardeners have many theories regarding the destructive blight of melon vines that blackens whole fields of these delicious fruits just as the oldest melons approach maturity. No matter how healthy and luxuriant the plants may be; how thorough the cultivation, nor how generous the supply of plant food may have appeared at planting time, the dreaded brown spots are almost certain to appear on the foliage at the base of the vines, shriveling the leaves and spreading with disheartening rapidity out to the youngest growths, until the field looks as though it had been subjected to a killing frost. The vines stay green and plump for some time after the leaves are gone, but the melons remain absolutely in a stage of arrested development, those not ready for the table gaining nothing more in sweetness or flavor, but falling into insipid decay as the leafless vine perishes. The rapid progress of the blight, often spreading in a day or two from a given point over the whole patch, and the partial immunity that goes with a thorough use of the copper fungicides, when begun at an early period in the development of the vines, quite conclusively prove it to be of fungous character, though many practical growers who have repeatedly witnessed the devastation of their fields, claim it to be simply unpreventable sunscald. The most violent attacks generally occur when hot sunshine closely follows profuse rains, but this is precisely the condition that most favors the spread of germ troubles. The Melon blight, though not unknown in early days, has spread nearly over the country in its destructive form, and is most prevalent in the older melon-growing sections, where the soil seems thoroughly infected. It is beginning to affect the Rocky Ford melon fields, although the dry climate does not favor its development, and it seems to be only a question of time before it invades any new tract upon which melons are grown. While it attacks all melons, the better varieties of muskmelons are most subject. Watermelons and some of the coarser cantaloupes are partially resistant, and in favorable seasons often escape serious injury, though the most successful growers count on a yearly curtailment of the crop from this cause.

In past years the market gardens about the Rural Grounds were noted for the excellence of their melons, which were largely shipped to less favored localities, but the crop has lately grown so precarious that it is only planted for casual trials, with little hope of profit. The vines generally start off well under expert treatment, but succumb when the strain of fruit ripening comes on, leaving the blackened field full of nearly matured but worthless melons. Our own record is two partial crops of fair melons in six years. The cost in money and labor of spraying the plants from the blooming period to maturity each week is too great, and the effort was made this season to give greater vital resistance by supplying them with abundant soluble plant food at the critical period of greatest strain when the prepared fertility in the hill was becoming exhausted. When the first melons attained a diameter of two or three inches, five-inch flower pots were sunk in each hill, a tablespoonful of nitrate of soda thrown in and the pot filled with water, which gradually soaked into the soil, distributing the fertilizer. This was repeated two times, adding as much bone phosphate and muriate of potash at alternate applications. Several hills were left without preparation as checks. Although the growing season was too rainy for the best results of such stimulating treatment, the treated plants grew much more vigorously, resisted the blight longer and ripened the only well-flavored melons we secured. Two applications of dry Bordeaux powder were made when blight was first noticed, and it undoubtedly delayed the spread of the disease, which was very gradual. There was enough difference in the behavior of the stimulated plants to warrant repeated trials, and better results may be possible in a normal or dry season. The idea is to feed the plants just at the time the rapidly developing fruits demand the greatest activity in the elaboration of the sap by the foliage. The plants under trial all had a plentiful supply of compost in the hills, but it is probable that nitrification of organic manures may not go on quite rapidly enough at the moment of supreme demand to preserve the vigor of the plant and enable it to resist parasitic germs.

A LONG TREE AVENUE.—The first bulletin of the International Society of Arboriculture is wholly devoted to advocating the extensive planting of the hardy native Catalpa, C. speciosa, as the most useful and promising timber tree of the future. The Government and corporations are specially urged to make extensive plantings to counterbalance the rapid exhaustion of hardwood timber now evident to all. The true Catalpa speciosa, growing naturally in the lower Wabash Valley, is often confounded with the more common C. bignonioides, found in all the Southern States. Bignonioides is much inferior as a timber tree, being of smaller crooked growth, yet its seeds have been substituted for Speciosa to a great extent, much to the disappointment of planters. The timber of Speciosa is declared to be, as the result of innumerable experiments, the most useful of any of our native woods, equaling the best in strength, durability and beauty of finish, and greatly exceeding all in rapidity of growth. A special plea is made for the cultivation of Speciosa for railroad crossties, the consumption of which yearly sweeps away thousands of acres of thrifty young forest. It is said to be very lasting for this purpose; ties put in under ordinary conditions 10 years ago scarcely showing decay, and the prediction is made that they will endure 30 years when properly ballasted, and posts set half a century ago are still in use. Some were exhibited at the New Orleans Exposition that had been standing in a fence for 90 years and were still sound enough for long additional service. The cause of this great durability, which is quite unique among rapid-growing trees, is sought in the chemical composition of the wood, which is found to be charged with fatty and resinous matters, acting as permanent antiseptics. If the railroad corporations of the country could be induced to plant Catalpas along their right of way the astonishing feature of avenues of trees over 1,000 miles long would be possible along many important lines. As experiments have already demonstrated that the Catalpa will make ties in 16 years and renew itself from the stump when cut even more quickly, it seems possible to keep up a continuous supply after plantings are once established. The present limited dissemination of Catalpa speciosa is explained by the fact that the seeds are not distributed, like species bearing edible fruits or nuts, by birds or animals, and only to a limited extent by wind; the winged seeds being almost entirely scattered down stream by water. The confusion with the comparatively valueless C. bignonioides is responsible for the general lack of appreciation of its economic qualities.

THE LESCOVEZ QUINCE.—Several distinct and excellent quinces are grown among the Balkan Mountains, forming the northern boundary of European Turkey. Among these is the Lescovez quince recently illustrated in a foreign horticultural journal. It is said to be very large and handsome, and to possess a most distinct flavor, which it imparts to marmalade, the product being very light in color. Considering that quince marmalade has been made and appreciated for more than 2,000 years the desirable varieties of quinces have increased very slowly in number. We are still planting practically the same varieties that were popular at the close of the eighteenth century, although hopes are entertained of the new kinds originated by Burbank. The Lescovez quince trees are said to be hardy and very prolific. The Borgeat quinces now on trial on the Rural Grounds are vigorous and handsome growers, but have not yet fruited. W. V. F.

Hardiness of Munson's Grapes.

W. H. W., Malden, Mass.—I have been very much interested in Dr. Tinker's article on Prof. Munson's new grapes. But when he says America, Manito and Beacon are "hardy," what does he mean? Hardy *where?* In Texas or in Ohio?

ANS.—In writing from eastern Ohio reference to hardiness in my article on Prof. Munson's new grapes applies to Ohio, for a grape that is hardy here is hardy in any part of this State. The parentage given following each variety will give to those acquainted with the hardiness of each of the species of grapes some idea of the probable hardiness of these sorts. However, all Prof. Munson's grapes can be grown in the Northern States that do not ripen later than the Catawba, and fruited successfully by covering the vines with soil in the Fall, and so can many of the pure Vinifera if grafted upon resistant stocks. Nearly all of the pure Vinifera will stand zero temperature in Winter. America and Beacon have stood 27 degrees below zero, and borne good crops. I have reason to believe that a large number of Prof. Munson's new grapes can be successfully grown in the grape districts of the North without protection.

G. L. TINKER, M. D.

Tardy Bearing Plums.

H. J. S., Kenwood, N. Y.—I have 18 plum trees with three seasons' growth on them from nursery. They are Abundance, Spaulding, Satsuma, Juicy, Milton, Burbank and Wickson. They have made a growth of nearly four or five feet in a season. None but the two trees of Burbank have borne execpt specimens. The Burbank, with much thinning of fruit, has done well this year. The new growth has been cut back freely each Spring. Can I induce bearing by cutting back the new growth before the leaves fall this Autumn?

ANS.—It sometimes occurs that plum trees will not bear as early as they should, but they are rarely faulty in this respect, especially the varieties that are mentioned, except it may be Satsuma and Wickson, which are quite thrifty growers, and somewhat tardy in their bearing. To cut them back severely at this time of the year would not be wise, but a little clipping of the branches would not hurt them. But I don't think it would cause fruit buds to develop, because it is too late in the season. Fruit buds are usually formed in June and July, according to the best information we now have. They are not old enough to bear much yet. H. E. V. D.

All harness, old or new, is made pliable and easy—will look better and wear longer—by the use of

Eureka Harness Oil

The finest preservative for leather ever discovered. Saves many times its cost by improved appearances and in the cost of repairs. Sold everywhere in cans—all sizes.

Made by STANDARD OIL CO.

HOPE FARM NOTES

TRANSPLANTING STRAWBERRIES.—I received the following note from a first-class fruit grower of Massachusetts:

I see that you will transplant strawberry plants in wet soil. You say: "Cut around the plant, and with the fingers squeeze a good-sized ball of dirt around the roots." On my soil, which is heavy, this does not work well, for the little ball cakes hard around the roots and restricts them. They do well for a time, but the roots do not work out through the ball.

We have not been troubled in this way, though we have followed the plan for several years. Of course we do not leave the plants in the sun after squeezing the soil around them. They are not permitted to bake hard. When put into damp soil we scratch the earth around and over the ball, and in a short time it becomes as soft as the soil around it. The danger from this plan I should think would be in squeezing the ball around the roots, letting it bake hard in the sun, and then setting in partly dry soil. The place where we set the plants is close to where they are grown, and we take few at a time. The soil is now much drier, and so we are using the Richards transplanter. The plants set with this never stop growing. Not long since we received some plants of new varieties by express. The soil had been pinched or balled around the roots, and had baked quite hard. They were set in moist ground and now it is impossible to find where the ball was.

A LAZY WINDMILL.—For the first time in two years our windmill stood still for four days in succession. On September 1 the sun came out hot and clear, but with hardly a breath of air. We kept the mill in gear night and day, but I doubt whether it pumped a gallon in 100 hours. The tank ran dry—aided by a small leak at a joint near the pump. We had been pretty liberal in our use of water anyway of late. We never knew what that mill represents until we found it necessary to pump that water by hand. The women folks demanded just as much, and the stock refused to go thirsty just because the wind took a week off. When you come to the job of pumping water up into the air just for the sake of letting it run down when you want it, the steel and wood of the mill beat the human back all hollow. We never know how hollow the victory is until the back aches, and we straighten up from the pump only to hear the Madame say: "Hurry now and let me have more water—there's not half enough here!" The trouble with us was that we got a little too sure of our friend the wind. There were plenty of chances to pump the tank full and keep it full. We let the pump stand idle and when the wind caught the asthma it caught us with a tank half full. That's what you get by taking chances with wind. When we woke up Sunday morning and found a young gale blowing we kept that mill at it till the tank filled up and ran over.

HAY NOTES.—The sunny weather during the first week in September gave us a good chance to get the second cutting of hay under cover. One old hillside that has, I think, been seeded for a good many years, threw up a heavy second growth of "foxtail" and wild carrot. We cut and cured it as though it were the finest of Timothy. What is the use of fooling with this weed, you will say. The horses eat practically all of it. Old Major cleans up the wild carrot as most horses do the tame vegetable. It is a clear saving of fodder. How about the weed seeds? I consider them less dangerous in the manure pile than when blown and scattered all over the farm. Many are killed in the manure. Those that survive go out on the corn, where good cultivation is given, so that weeds are killed. The animals eat certain weeds at pasture—doing it, I think, partly to "doctor" themselves. These same weeds, when dried in the hay, are useful for the same purpose. . . . The second growth on the upper field where we tried the "Clark" grass culture is heavier than the first. This is a pleasant surprise, and seems to show that the crop will do its duty yet. Very little Red-top is apparent in this second crop. After the first crop was cut we broadcast a mixture of equal parts of nitrate of soda and sulphate of potash. My experience in grass and this year on potatoes makes me feel quite sure that it is much better to use potash with the nitrate. . . . . The lower field of "Clark" grass is pretty close to a failure—so far as the second crop goes. The wet season has kept this field drenched. The soil was fit only to produce coarse swamp grass and weeds. Soil does just what it is fitted for, and so instead of a good crop of Red-top and Timothy we have on most of the field a crop that will be useful chiefly for bedding.

AROUND THE FARM.—It happens that we have no cow peas this year except a volunteer crop on one of the back fields. Last year's crop stood on the field all Winter. I thought rain and frost last Fall had ruined the crop, and many bushels of seed were lost. This Spring we plowed a strip in this field, turning under the cow-pea vines. To my surprise a fair stand of plants started up on this plowed ground and are making a good growth. I had no idea that cow peas could stand such a trial as that. . . . We are slowly getting the land plowed and fitted for wheat. I do not intend to sow Timothy with this wheat, but shall sow clover alone next Spring. This will be our preparation for setting an apple orchard. I may set the trees this Fall right among the wheat, and plow three or four furrows on each side of them next Spring. On a field at the far western end of the farm we had last year a heavy growth of cow peas. They rotted down on the ground, and the Spring was so wet that we could not turn them under in time for oats. They have covered the ground all Summer, and now we are plowing them under for wheat. The goldenrod where these cow peas were rotting stood 18 inches higher than that on the natural soil outside of this strip. . . . The corn is earing out well, and in spite of the late planting there will be a fine crop. Some of it was planted 25 days after the ordinary "corn-planting time" for New Jersey. It is on a hillside. I should hardly dare attempt such late planting in a low valley. . . . What a season this has been for turnips. I have never had them grow so fast. The yellow turnips are spreading out in the rows as though they knew that worthy people expect to draft them as substitutes for potatoes next Winter. The Cow-horn turnips do not grow so fast, but they have far outstripped the Crimson clover. Where the two were sown together one would think at first sight that it was a field of young rape, but the clover is there—stooling out beneath the turnip leaves.

TABLE STUFF.—Nott's Excelsior peas have given us a fair crop this Fall. They were planted late in July, and in spite of the wet season matured a fair crop. Telephone peas are blooming, and promise to fill the basket before frost. We have never before had such success with late peas. . . . Baked Fall Pippin apples with thick cream help to make the Hope Farmers let September pass without regrets. The cow is a gentle creature, and cream is her purest extract, but when it lines a man's stomach it gives him the courage of a lion. . . . . Sweet corn is at its best just as the nights take on a little nip of coolness. The time to pick it off the stalk is when the women folks begin to get ready to take up dinner. Let it live until the last moment. Then snap off a long, slender ear with the silk just turning a dry brown. Get its jacket right off and bob it at once into a kettle of boiling water and put the cover on tight. Cook it rapidly and rush it to the table so hot that few dare touch it with the bare hand. To see a hungry man put salt and butter on one of these great ears and then slowly put it between his jaws is enough to fill the toothless man with the wildest possible pangs of regret, and to make him remember that the same condition which seems to loosen his own teeth appears to firm and sharpen those of Time.

RUNNING DOWN.—So old Time gets a little firmer grip at you as the years go by, does he? It would seem so, and we feel it more in the Fall than at any time of the year. September comes much like a man waking up on the morning of his forty-fifth birthday. Three corners of the average working square have been passed. You are no longer young, and the harvest doesn't amount to much after all. There are weeds in the corn and small potatoes in the hill of life. They might have been larger if you had not spent so much time resting in the shade. Some men reflect on these things, and end by saying that since their chances are gone there is no sense in working on with a poor job. Others get themselves together and mutter: "Work, for the night is coming when no man can work!" No man has any business to sit with folded hands listening to regrets. Let them alone—kick them off and work on. September doesn't mean that the end of all is coming. Nature is just getting ready for a rest. While she rests you may work and catch up a little. H. W. C.

The Cause of Appendicitis.

The following article is reproduced from the University Medical Magazine. I believe that the article may be of interest to you because it very clearly demonstrates the folly of fearing to eat seedy fruits, such as grapes, raspberries, etc., on account of the possibility of appendicitis developing because of the lodgment of seeds in the vermiform appendix. This fear has in many localities lessened the consumption of certain fruits, and while injuring the fruit growing industry, the chief reason for regret is that many people deny themselves the use of wholesome fruits.

An interesting study of the relative frequency of foreign bodies in the vermiform appendix is presented by Dr. John F. Mitchell in the Johns Hopkins Hospital Bulletin for January, February and March, 1899. Of 1,400 cases of appendicitis collected from various sources during the last 10 years he found only seven per cent of true foreign bodies; while in 700 of these cases, in which a definite statement was made as to the nature of the foreign body, there were 45 per cent of fecal concretions. In 250 cases of appendicitis in the Johns Hopkins Hospital, in the past 10 years, there was only one foreign body—a segment of tapeworm. Osler, in 10 years' experience in Montreal, found foreign bodies only twice; in one instance five apple pips, and in another eight snipe shot. The most common foreign bodies have been gallstones, round worms, spicules of bone, bristles and pins.

Pins have been especially frequent. Dr. Mitchell has collected 28 cases in which a pin was found in the appendix at operation or autopsy, together with two instances in which a pin had perforated the cæcum. It seems remarkable that in no single case was there any knowledge of a pin having been swallowed. Contrary to what might be expected, they occurred more frequently in males than in females (males, 17; females, nine). The resulting appendicitis was of a very variable type, in some cases the symptoms were mild, leading to chronic appendicitis, with recurrent attacks, or with long-continued pain, and, perhaps, finally ending in an abscess. In the majority of cases, however, there was rapid perforation and abscess formation following the first appearance of symptoms.

The pin entered the appendix by its head or point, and, except in one or two instances, where it lay directly across the lumen, it was straight, with its long axis parallel to that of the appendix. In seven of the 28 cases the appendicitis was associated with abscess of the liver. The author concludes from his investigations that foreign bodies at one time thought essential in appendicitis are now known to play a much smaller role than that formerly accredited to them; and fecal concretions are much more apt to be present as an exciting cause. Foreign bodies of light weight, like grape seeds and cherry stones, so popularly assigned as the cause of appendicitis, and against which we are forever being warned, are in reality exceptional, and their frequency is much overestimated on account of the close resemblance of fecal concretions and the lack of careful examination of the bodies described.

I think that the essential facts of the article above should be given wide publicity. J. S. R., M. D.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, SEPTEMBER 21, 1901.

JUST outside a window of a New Jersey house a large black spider has spun a web about the size of a dinner plate, and is making an effort to handle his end of the mosquito problem. The window attracts the mosquitoes. They evidently expect to fly into the house, but land in the web instead, and their long legs and wings are quickly tangled up in its meshes. On warm evenings the spider has to work overtime to handle his victims, and he is certainly a high liver in every sense of the word at present. The inmates of the house consider him a public benefactor, and will not brush away his web until the mosquito season is over at least. It is to be hoped that the mosquitoes will not give the spider a touch of the malaria.

•

ONE of our readers says that he spent a good share of Labor Day chasing thieves and hunting police and constables to arrest drunken rascals. No wonder he says:

> This is "Labor Day," and withal a legal holiday. Selling whisky on legal holidays is in our State a crime punishable by a heavy fine, as is also selling it to minors. Yet with all these boasted bulwarks of safety thrown so protectingly around us, I was obliged to call the police to arrest a boy apparently not more than 18 years old, and naked except for pants and shoes, raving like a madman and threatening everything in reach. A part I suppose of the boasted liberty and civilization of the twentieth century.

Why, yes—when law and its enforcement fall into the hands of politicians a good share of the "liberty" seems to go to rascals and rogues.

•

MANY references are now made to the so-called "grandfather clause" in the new constitution which is to be submitted for ratification to the voters of Alabama. This clause gives the right to vote to all men of legal age who are descendants of soldiers who fought in the Colonial, Indian, Mexican or Civil wars. The object is to save illiterate whites from the general requirement that no person shall be allowed to vote who cannot read and write any Article in the Constitution of the United States. The "grandfather clause" is generally regarded as an unjust discrimination against the negro, and it is also held by some eminent men that the creation of a class of hereditary voters is contrary to the basic principles of our Government. The question is arousing a great deal of controversy, and is likely to be carried to the United States Supreme Court to settle its constitutionality.

•

A THOUGHTFUL business man once said that the neglect to pay small bills is the unpardonable sin. Such neglect certainly does at times cause serious annoyance, if not embarrassment, but to our mind it is a much greater wrong to dispute the bill on technical grounds, after the service has been rendered. One may excuse the man who, with an honest purpose to pay his bills, neglects for a time to do so, but there can be no excuse for the wilful dodger. This man, after having received honest and worthy service, disputes the bill for the evident purpose of forcing a compromise which the creditor will often consent to rather than go to the trouble and expense of a lawsuit. A favorite trick of this class of debtors is to propose an arbitration. He offers to choose a man, the creditor to choose another and, in case they do not agree, they to choose a third. This is an alluring and deceptive proposition. It would be fair enough if an honest difference of opinion existed, but the debtor is simply working to scale down his just obligations. He has nothing to lose and everything to gain. The representative of the creditor can demand only his just dues, while the debtor's man, sometimes with a promised share in the spoils, can demand a large reduction. Of course, they do not agree, and the natural thing for the third man to do is "split the difference" and close the dispute. A strictly honest man may neglect his bills for a time, though the habit is a bad one, but no one but a trickster or a rascal will attempt the other course of "compromise" with intent to steal!

•

THE most remarkable thing about the murderous attack upon President McKinley is the folly and uselessness of such a thing. A man of singularly pure private life, remarkably free from public scandal, is shot down in the most cowardly manner under circumstances that should make the blood of every true American boil with indignation. What could the cowardly rascal who did this foul deed expect to win by it? How could he hope, in this country, to improve his own condition or the lot of any honorable body of citizens by committing murder? Here in this land apparently set aside by a divine Providence as a place where men should work out the great problems of human liberty, thrice within a single generation the ruler is laid low by the assassin's bullet. What does it mean? There are many sides to the question—one being the fact that most of the bloodthirsty king-killers have been driven out of Europe, to find a refuge here. They take advantage of the very freedom of thought and action granted them here to keep up their murderous work. The time has come to squelch them with a heavy hand. Down with them. They have no place in a republic!

THE DEATH of the President causes sincere and heart-felt grief throughout the entire country; political strife or personal feeling is alike hushed in the presence of a great sorrow. All classes unite in affection and respect for the memory of one whose private life and character represented all that is best in American citizenship. In the solemn moments of a National calamity which binds us together in sympathy for the bereaved, we are the better able to judge of the purity of life and loyalty to country which brought our late Chief Magistrate so close to the plain people. There is no need to eulogize the dead; half-masted flags and costly trappings mean little, for they are lavished on worthy and unworthy alike, but the real and enduring monument of William McKinley will remain in the heart of the great American people, whose respect for an honored Executive is now merged in earnest sorrow for the man.

OF the hundreds of millions of people who have lived in this world, not a thousandth of one per cent have been known outside their immediate neighborhood; fewer have done anything sufficiently out of the ordinary to attract much attention; and still fewer have gained any considerable amount of money. It is evident that, if a name, great deeds or wealth are essentials of a successful life, most people have failed. The fame of many has been infamously bad, and their wealth ill-gotten, so that the number who have been famous for their good deeds, or have become rich without dishonesty or oppression of others, is exceedingly small. On thinking over these things some people become depressed. They give up all idea of attaining anything great, and are wretched because they can't, thus adding misery to discouragement. Take these three things: good character, money, and fame. The first lasts, is within the reach of all, and should be looked upon as the one essential. Of the two latter it is safe to say that one should get as much as he can with due consideration for others, and the fact that so few have attained these two much-to-be-desired things should spur him on to great, yet intelligent effort.

•

RUMORS reach us that the oleo people will endeavor to capture the National Farmers' Congress, which meets in Sioux Falls, S. D., next month, through attempts to convince the cotton growers of the South and the fat-stock men of the West that oleo is essential to the success of their respective interests. Governor Odell, of New York, has done well to appoint a strong delegation from this State to help refute these arguments. We could suggest no men better qualified to represent the great dairy interests of New York State than those named in this delegation. There is just one man, however, who should be added to the list. That man is Commissioner Charles A. Wieting. It would add strength and force to this already strong delegation if it can be led by the head of the Agricultural Department of the State. The other delegates, conscious of the task before them, and confident of the strength which the Commissioner's name would add to the delegation, are making efforts to secure his attendance. No doubt so long a trip at this time would be a severe tax on his already crowded time, but since there is a demand for his service we believe that he will not shrink from the responsibilities, no matter at what sacrifice of either personal or other official duties. The Commissioner should head the delegation from the Empire State.

•

THIS year we have been overrun with insect pests of all classes. Those injurious to farm and garden have been most perniciously active; so, too, were all the indiscriminate beetles, worms, flies and bugs whose apparent mission in life is to rasp the nerves of mankind. Several persons have remarked to us that the caterpillars now skeletonizing both shade trees and garden are merely a temporary trouble; that they would be destroyed by the first frost. Such persons are, of course, quite ignorant of the life history of insects, but doubtless there are many others who take the same view, and ignore any means of lessening the plague. It is true that Nature herself takes a hand, and restores her balance sooner or later by plague or parasite, which thins the ranks of injurious insects, but that is no reason why we should adopt a let-alone policy. Every community should unite in the fight against insects known to be of injurious character. Tent-caterpillars and Hessian fly appear to have no redeeming qualities whatever, and the present season has shown us forcibly that a united policy of extermination is needed. Don't let them alone. Don't adopt an open-door policy towards these insect criminals!

•

WHAT shall be done with the anarchists? That is a vital question just now while the President of this Republic lies on his bier, their victim. It has been the boast of Americans that in this free country, free speech is permitted if not encouraged—as it ought to be. It is evident that this privilege has been abused. The man who tried to kill President McKinley was inspired by the frenzied speech of a half-crazed anarchist. The people who give such murderous advice regarding the use of the knife and torch would not themselves carry out their own threats. They either lack the courage to do so, or are merely talking for effect. Some poor, weak-minded person listens to their wild talk and carries out their suggestion. We have in this country a class of men, writers and speakers, who are dangerous because they are reckless in their public advice, and statements. Probably without meaning to do so they lead men to thoughts of hatred and revenge—sowing the seeds which in time will produce lawlessness and murder. The country to-day is in no mood to play or experiment with those who preach murderous doctrines. The anarchists who would send half-crazed men to assassination must shut up or view the inside of a prison!

•

BREVITIES.

WHY are bees winged merchants? Because they keep stores and cell honey.

LET the fat hen bring back her love for eggs by laying for concealed grain with her legs.

WE consider that the work done by T. V. Munson has been of great value to horticulture.

AN English ship just starting for the polar regions is to be lighted by electricity—generated by means of a windmill placed in front of the mast.

IN some parts of the West farmers turned out with other workmen in the Labor Day parade. Why not, since the workmen are the farmers' best customers?

EVERY time a human being is lynched without due process of law, every time human life is cheapened by greed or carelessness, seeds are sown which will one day spring up into an attempt at public murder.

LONG ISLAND pickle growers are having a prosperous season. More than the usual number have sprayed their vines with Bordeaux, and the result is that the blight has done but little injury. It is said that some fields are yielding 100,000 pickles to the acre, which are selling at from $1.50 to $2.50 per 1,000.

CONFIDENCE men have hatched up a new form of swindle in the shape of bogus gold dust and nuggets, which have been palmed off on Klondike dealers. Brass filings in small quantities have been mixed with the genuine dust, and it is said to be very hard to detect the deception. In one case a large nugget was found, which proved to be brass and copper thinly washed with gold.

EDWIN VAN ALSTYNE, the efficient manager of the dairy contest at the Pan-American Exposition, would hardly be taken for a poet, yet we are told in a press report that he was recently heard humming the following original song:

"How doth the little busy pig
Improve each shining hour,
By gathering sausage all the day
From every opening flower.
When the shades of evening fall,
He hies him to his sty
And sings his pretty evening hymn,
Root, pig or die."

Events of the Week

THE PRESIDENT.—The crisis in the President's condition was reached September 13, and his death occurred early the next morning. A number of avowed anarchists in Chicago have been arrested as associates of Czolgosz, and the group in Paterson, N. J., suspected of complicity in the murder of King Humbert, is under close surveillance. There is a disposition in all European countries, and in the United States, to enact further special legislation for the suppression of this class. In this country, such an attempt, unless death result, is punished with an extreme penalty of 10 years' imprisonment, unless a new law is enacted for his case. It is advised by many of the judiciary that such a crime be specified as treason and punished by the death penalty. Indiana and Wisconsin purpose introducing bills into their next legislatures to exclude all avowed anarchists from these States. Emma Goldman, the anarchist lecturer, was arrested in Chicago September 10, it being believed that her utterances inspired the attack by Leon Czolgosz.

DOMESTIC.—Six armed men held up a passenger train near Texarkana, Tex, September 4, blew open the express safe, and secured a large sum of money, estimated at $50,000. . . . . Suit has been instituted in Schuylkill County, Pa., by Mrs. Elizabeth Burmeister against the borough of Ashland, to recover $10,000 for the death of her husband from smallpox, the borough having failed to organize a board of health. . . . . Advices from northern Labrador show that Arctic floes continue to blockade the coast. Such a state of things was never known before. The fishery is very backward; indeed, it is the worst on record in the more northern parts. Thousands of fishermen are doomed to a very poor return for the work of an arduous season. Numbers of bergs are floating southward past the Strait of Belle Isle, forming a serious menace to ocean navigation. . . . . Fire which broke out in a factory at Jefferson, Wis., September 5, threatened to destroy the town. It was finally subdued, with a loss aggregating about $60,000. . . . . Forest fires are ravaging sections of Newfoundland, and threaten several large lumbering districts. Twenty-three houses have been destroyed in the settlement of White Bay, and it is feared that other villages have also been burned. It is impossible to cope with the fires, and unless a heavy rainfall extinguishes them the loss to timber interests will be very great. . . . . A fire at Salt Lake, Utah, September 10, caused damage reaching $200,000. A dynamite explosion caused by the fire injured four firemen. . . . . Memorial services were held at Galveston, Tex., September 10, in memory of those who perished in the great storm a year ago, and garlands of flowers were spread upon the incoming tide of the Gulf at sunset. . . . . The gale on lower Lake Michigan and Lake Huron, September 8-9, caused damage to shipping amounting to $200,000. No lives were lost, but 56 persons were rescued by life-saving crews. The gale was rendered more dangerous by thick smoke from forest fires. . . . . A fire at Denver, Col., September 8, caused loss reaching $100,000.

PHILIPPINES.—The Congressional party on the transport McClellan, which left New York July 10, arrived at Manila September 9. This delegation is to examine into the general administration of affairs in the Philippines, and report back to Congress any recommendation which it may consider necessary for the improvement of existing conditions on the Islands. The party consists of Senators Bacon, of Georgia, and Dietrich, of Nebraska, and Representatives Mercer of Nebraska; Smith, of Illinois; Burleson, of Texas; De Armond, of Missouri; Driscoll, of New York; Gaines, of Tennessee, and Green, of Pennsylvania.

GENERAL FOREIGN NEWS.—The Korean government has issued an order that no rice or grain should be exported, the cause being that little short of a famine threatens the country on account of a lack of rain. The whole country is in a most dreadful state. . . . . The Butchers' Association of Vienna has adopted a resolution demanding that the maximum tariff be imposed upon American lard, bacon and sausages. . . . . Venezuelan troops have begun the bombardment of Rio Hacha, an important town on the coast of Colombia. . . . . A fire at Foo Chow, China, August 20, caused damage amounting to over $1,000,000, and many people perished in the flames, which burned for two days. Riots accompanied the fire, and many were killed by the troops.

FARM AND GARDEN.—The Texas State Millers' Association, representing 200 millers, reports a shrinkage in the wheat crop of the State of from 15,000,000 to 5,000,000 bushels.

Professor B. T. Galloway, of the Department of Agriculture, has returned from an extended tour of the recently drought-stricken regions of the West. He was sent by Secretary Wilson to make an official and expert examination of the conditions of the districts where the suffering was most prolonged and the loss the greatest. He started with Michigan, and visited the States of Ohio, Illinois, Indiana, Missouri, Kansas, Nebraska and Colorado. The results of his observations will be embodied in an elaborate report on the causes and phases of drought and the remedial expedients to which the Department can advise farmers to resort. Mr. Galloway says the drought was a great moral lesson to farmers generally, and that they will be likely to profit by their experience in the development of ways to avoid the consequences of a failure of crops for want of rain.

The rural free delivery service will, in a few weeks, furnish to its patrons stamped envelopes bearing return notices, stating the route on which they were mailed. In case of non-delivery they will be sent back to the carrier who first collected them, and be by him returned to the person who deposited the letter in the mails. This new feature of the service is intended to give the rural patron the same facilities that are now enjoyed by those who live in the cities, and to render their letters more secure in the mails.

The Farm Crops Division of the Illinois College of Agriculture has been called upon to supply corn and other crop judges for the Illinois State Fair, the Indiana State Fair, the Peoria Corn Exposition, the Atlanta Fair, the Champaign Fair, and numerous other exhibits of corn and farm crops. In addition to this, the students of this department have been asked to judge the exhibits of corn, wheat and oats at nearly all of the county farmers' institutes in the State this year. The work will be done according to the score cards arranged for judging corn, wheat and oats which are used in the regular class instructional work at the University.

The eleventh annual meeting of the New York State Veterinary Society opened at Ithaca, N. Y., September 10. Many veterinarians from other States came from Atlantic City, where the annual meeting of the American Veterinary Association has been held. Among them were Dr. S. S. Stewart, secretary of the American association; Dr. C. C. Lyford, one of the leading practitioners of Minneapolis, and Prof. M. H. Reynolds, of the University of Minnesota. The officers of the Society for the present year are as follows: President, Roscoe R. Bell, Brooklyn; vice-president, George H. Berns, Brooklyn, and secretary-treasurer, Claude O. Morris, Binghamton, N. Y.

The eighth annual convention of the National Hay Association began at Indianapolis, Ind., September 10.

SELLING VALUES OF FARM LANDS.

How Has Agriculture Prospered?

CONDITIONS IN WASHINGTON.—Land has increased in value 15 per cent within the last 20 years. You will remember that this is a new country; 20 years ago there was not over one-tenth of the land taken or settled. A great deal of the land belonged to the Northern Pacific Railroad, which was sold to settlers at from 50 cents to $10 per acre. This same land is now selling at from $5 to $40 per acre. Other lands are selling in like ratio. One cause of this is a demand for homes from people of the Middle West. But the principal cause is that the farmers have found that a great deal of land that was not considered good for anything but pasture is the very best for wheat and fruit. H. R.
Diamond, Wash.

A DECLINE IN A GOOD MARKET.—Tamaqua is situated very nearly in the center of the anthracite coal fields of Pennsylvania; but north, east and south of us there are sections of fine agricultural land, which are highly productive when well farmed, and the latter is the rule, because of the fine home market at the mining towns and collieries within easy reach of the farmers. While the productiveness of farm land has been increased in the last 20 years, the land itself has decreased in value, and on sale now rarely sells for more than one-half the price it sold for 20 years ago. Money lenders and institutions in the towns will not loan on farm property except at a large margin. While I know of many cases where farms have sold at decreased prices, I know of none at an increased price. The causes may be the laborious character of the occupation, the inclination of the farmers' sons for other occupations, and the consequent scarcity of farm labor. H. B. G.
Tamaqua, Pa.

A DECLINE IN OHIO VALUES.—About 29 years ago David Hilty, former owner of the farm I now reside on, refused $125 per acre. The farm contains 171½ acres; then had not a tile on it, and the same buildings we have to-day; about four acres of apple orchard. Seventeen years ago I bought this farm at the administrator's sale for $91 per acre; have kept buildings rooted and in fair repair, and except being somewhat out of style, they are in many respects as good as new. I have tiled out on this farm all the wet places, laid in miles of tile, from two to eight-inch in size; have planted over 1,200 fruit trees, such as peach, quince, sour cherry, pear and plum; many now ready to bear—a model young orchard. This sold at public sale on June 12, 1901, with about 20 acres of wheat growing on it that will make 30 bushels and more per acre; 25 acres of Red and Alsike clover mixed that will make over 2½ tons per acre; 75 acres of White clover and Blue grass pasture equal to anything that can be produced in famous Kentucky, for $46 per acre *on long time*. I have learned years ago that while the public press was parading the great National prosperity *we* were enjoying, that we as farmers were positively and completely excluded. J. C. A.
Rittman, O.

DAIRY PROSPERITY.—The price of farms and dairy products touched bottom here just previous to the Summer of 1899. The rise in price of dairy products during the Fall of 1899 and 1900 gave farmers here a real slice of prosperity, and caused farms to be in good demand at an advance of about 25 per cent. Before me lies a statement of one of the best cheese factories around here. The sale is from July 19 to August 1, and the net for 100 pounds of milk is .774. The little spurt of prosperity for the general dairy farmer has nearly disappeared; and while the farmer takes .774 for his milk he finds himself charged trust prices on nearly everything he has to buy, especially labor. Tenant-farming is on the increase, and generally hastens run-down conditions, with a galaxy of docks, wild carrots, paint-brush, live-forever, etc. All kinds of pests combine to make it harder for a farmer than 20 years ago. One of the largest, best and most productive farms here about 28 years ago sold for $12,000. The farm and buildings were steadily improved and sold 12 years ago for $10,000. This year the same farm sold for $8,000, a decline of 33 1-3 per cent in 28 years. In 1873 the milk from 21 cows netted $1,100 from the cheese factory. Last year the same farm sent a larger quantity of milk and received $900, and last year was the best in years. A. L. H.
Norway, N. Y.

ADVANCE IN MINNESOTA.—I came here on this place (soldier homestead) in 1880. It was considered worth $1.25 per acre. I have 171½, and to-day I value it at $4,000. The farms have all been taken under homestead entry, mortgaged, and then abandoned. Land here is being taken now by men from Iowa, Missouri, etc., and nearly all occupied. Values of produce, such as potatoes, are not quite as high as when I came here, as I have sold potatoes for $1.50 per bushel. They are now selling at 40 cents. I do not see but that my place produces as well or better than when I first came here, as I have never had a complete failure since I have been on it. We have a light sandy loam near me, but on Mississippi River have heavy clay. I will take the loam. I do not raise much tame hay; we have fine wild meadows. I think the reason of the advance in price of land in this locality is caused by having a better class of people coming in. The first ones were a kind of Oklahoma boomers trying to get something for nothing. There have been five new houses put up here this Summer, and the places that have put them up five years ago could have been bought for $500 each. Now you could not get them for $1,000. Of course, our sales are a great deal more now than when we came here, for then the place was new. I have now only about 40 acres in cultivation; the rest is pasture and hay. My business is butter. E. A.
Crow Wing Co., Minn.

SOME IMPROVEMENT.—There has been a very heavy decline in prices of farm property; from 15 years ago to four or five years since from 25 to 50 per cent. What is the cause? I can only give my opinion. From 20 to 25 years ago much property changed hands at high figures, men giving mortgages at high rates of interest. They failed to meet their obligation and this resulted in foreclosures of mortgages, thereby throwing a large amount of farm property on the market, and there were more sellers than buyers. This condition was brought about by so many going West to obtain cheap lands. Another cause was that men who had money to invest put it into western lands as well as bonds and mortgages, at a high rate of interest. High rates of interest and low prices of farm produce almost invariably cause cheap lands, while low rates of interest and a high price for farm produce result in high-priced lands. So a combination of causes produced depreciation in farm values. But within the past three or four years there has been a gradual stiffening of prices and greater activity in the market for farms, simply because there is not so much cheap land to be obtained in the West, and farm produce is bringing better prices than 20 years ago, as my book of sales indicates. Although no great number of farms have been disposed of at great advance in price, I have heard of several places that have sold at quite an advance, and there is a strong tendency to ask more than formerly. I believe a reaction is taking place, and it will not be long before our farms will bring former prices.
Palermo, N. Y. G. F. H.

A REPORT FROM MICHIGAN.—Your question, whether farm lands have increased in value, causes me to give a few figures in this locality, Clinton Co., Mich. Farm lands compared with 1893 have increased in value about five per cent, but this is an unjust comparison. The farm that I occupy was purchased in 1886 at $55 per acre; $2,500 worth of substantial improvements have been made and it has been offered for $60 per acre. The annual income of this farm ranges from $1,400 to $1,700, besides furnishing milk, butter, eggs, meat, fruit of all kinds, fuel and vegetables for a family of seven. A farm joining me sold for $41 per acre; buildings old and rundown, for which in 1876 an offer of $75 per acre was refused. A farm on the south sold recently for $40 that would have brought $60 in the year 1875. Farm values have not advanced since 1884; with added improvement, compared with 1876, they have fallen 25 to 40 per cent; compared with 1893 have advanced five per cent. It is very evident to me that farm values have not shared in the boasted general prosperity, and why they do not I cannot see. Farming is a very profitable business in this section. I know of farmers who are making an annual payment of $800 to $1,000 a year on a 120-acre farm, besides a good living, but much depends upon the skill and management of farm and economical purchase of luxuries and fixtures. This is one of the richest counties in Michigan, the assessed valuation over $17,000,000, and this chiefly an agricultural district. Only one other county in the State has as much land under cultivation.
St. Johns, Mich. W. N. R.

THE NEW YORK STATE FAIR.

The weather was against the Fair this year, and the attendance was not so large as was hoped for, yet it will go into history as one of the best of the series. It was as clean as a whistle. There were no objectionable side shows or "barkers" to draw attention from the legitimate exhibits, but the respectable and orderly crowds enjoyed themselves in true rural fashion. The exhibits of live stock were enormous. Some of the finest animals in the State were shown, and the stalls and pens were constantly surrounded. The display of fruit and vegetables exceeded anything ever seen before in the State. Much of this was due to the increased competition caused by the work of the New York Fruit Growers' Association. This society was organized barely six months ago, yet it won first prize for best exhibits, showing all told 2,254 plates of fruit, or 462 varieties. These comprised 195 varieties of apples, five of crabs, 64 pears, 74 plums, 66 grapes, seven quinces, 46 peaches, three exotic grapes, one chestnut and one Japan quince. We hope to give next week a special report or study of the fruit exhibit.

As usual the most interesting feature of the Fair was the crowd. The farmers of New York who attend the State Fair are, as a rule, the cream of the profession. They are worthy and intelligent people, and to talk with them is to get a clear idea of the conditions of New York agriculture. Most of them are hopeful this year, but it must be admitted that the season has been a hard one. The fruit is scarce, and that means much to the New York State farmer. It is surprising what a factor in farm income good apples have become. Some of these careful and intelligent farmers are working out methods of culture and fertilizing that will make the work done by the experiment stations doubly effective.

Crop and Weather Report.

Drought still continues in portions of Texas and Oklahoma. There have been light frosts in the Rocky Mountain regions and Michigan, and snow has fallen in Montana. Farm work in Nebraska and South Dakota has been hindered by rains. The Eastern States have had a very favorable week. In the Central West late-planted corn is maturing and will soon be out of the reach of frost. The cotton outlook has improved, and picking is in progress. The only sections where improvement is noted in the apple crop are Arkansas and West Virginia. Wheat sowing in the Ohio Valley is progressing rapidly.

Woman and Home

From Day to Day.

THE REMORSEFUL CAKES.

A little boy named Thomas ate
  Hot buckwheat cakes for tea—
A very rash proceeding, as
  We presently shall see.

He went to bed at eight o'clock
  As all good children do,
And scarce had closed his little eyes,
  When he most restless grew.

He wrapped one leg around his waist
  And t'other round his ear,
While mamma wondered what on earth
  Could ail her little dear.

But sound he slept, and as he slept
  He dreamt an awful dream
Of being spanked with hickory slabs
  Without the power to scream.

He dreamt a great big lion came
  And ripped and raved and roared—
While on his breast two furious bulls
  In mortal combat gored.

He dreamt he heard the flop of wings
  Within the chimney-flue—
And down there crawled, to gnaw his ears,
  An awful bugaboo!

When Thomas rose next morn, his face
  Was pallid as a sheet;
"I never more," he firmly said,
  "Will cakes for supper eat!"

—Eugene Field.

*

AMONG the little cake cutters now sold are several decided variations from the ordinary round or oval scalloped molds. They are to be purchased in a series of animals, birds, letters, numbers and geometrical designs, some quite elaborate; also spades, hearts, diamonds and clubs, these latter being for card parties.

*

VERY uncommon rag rugs are made by knitting strips of cotton material like yarn, on large wooden needles. It may be knitted in stripes of contrasting colors, blue and white being very clean and cool looking. Such rugs may be washed easily. Artistic furnishers now realize the beauty of humble rag carpets and rag rugs, and they are often seen in handsome Summer homes. A large rug of good hit-and-miss carpeting, fringed at the ends, is very suitable for a dining-room finished in natural wood.

*

RUSTLING dress linings are out of date, say the fashion authorities. Time was when a gentle rustle meant silk linings and nothing else, and the desire of every woman with dress ambitions was to emulate that rustle. Then we began to get rustle percalines, and mercerized almost-silks, copying the truly-silk rustle so closely that it no longer remained exclusive. Consequently, the latest dictum is that we are to swish about softly, without that aggressive rustle, which, at times, became very oppressive.

*

REFERENCE made by fashion writers to the "singlet," in describing sailor and guimpe dresses, prove a little puzzling to the uninitiated. This name is given to the under bodice to which a shield or guimpe is attached. Many women who have been wearing the popular sailor suits this Summer find that the white shield, when detached, is very troublesome, riding up at front and sides, and disclosing unseemly gaps. This is obviated when it is attached to the underwaist or singlet, which buttons in the back. The little girl's singlet is, of course, attached to her skirt. Reference to the shields which insist upon divorcing themselves from sailor blouses reminds us of the gaping lace yokes which give an untidy look to so many Summer frocks. Out of sight, out of mind, says the old proverb, and when a waist fastens in the back or on the shoulder many women seem quite regardless of its proper closing. It is very difficult to contrive a fastening for a yoke of continuous fine insertion that does not spoil its effect. Most women compromise on small ornamental pins, but we know some who always sew themselves in! "It isn't so very hard," explained one, "after you get used to it, but it is a nuisance, when you're tired and hot, to pick out the stitches before you can get out of your frock!" This recalls the days of phenomenally tight sleeves, when some women were accused of having the inner seam of the sleeve, at the upper part, stitched together after the waist was on, to secure an absolute-

3902 Child's Tucked Dress,
1, 2, 4 & 6 yrs.

ly wrinkleless fit. At that time no really fashionable woman could put her hat on after her gown was fastened. We have certainly progressed since then.

*

A SMALL boy who had been directed to a course of nature study was recently called upon to write an essay upon bullfrogs. Johnny thought long and deeply upon the subject, and this was the result:

The bullfrog is large, green and warty. He can jump several times his own length. His voice is loud, but not pleasing. The bullfrog is shy and diffident. He builds his nest in damp swampy places, where it is difficult to track him. At the slightest alarm he utters a low, plaintive note and immediately seeks refuge in the water. He is a good diver, and can swim like a fish, except that he does not wiggle, but kicks. There was a frog once that blowed himself full of air until he busted like a paper sack. This shows the folly of vanity and self-conceit. O, my friends, let us endeavor not to act in that manner, but to be good and truthful. Let us remember that life is short, and that we must always be up and doing. Some people like bullfrogs to eat, but I would rather have pie.

*

IT is often thought that fish served at good hotels or restaurants is much nicer than that cooked at home. Really, the fish offered at the home table is likely to be better in quality, but the professional cook pays more attention to the sauce served with it. The simplest sauce for fish consists of about two tablespoonfuls of butter rubbed smooth or melted, to which has been added a teaspoonful of lemon juice and a tablespoonful of chopped parsley; this put over the fish just before serving. Half a cupful of chili sauce heated and poured over the fish is excellent; so is heated tomato catsup, thinned a little, with the addition of a few chopped olives or pickles. These are all simple. For smelts, or other small fried fish, sauce Tartare is usually served; this is an ordinary mayonnaise dressing, to which chopped olives, gherkins and capers have been added.

The Rural Patterns.

Simple little frocks that fall from the shoulders make the best possible models for little children. The pretty example is suited to both boys and girls up to two years of age, and to girls until they reach the mature age of six. The original is made of French nainsook and is untrimmed, the fine tucks making a sufficient and dainty finish; but all fine white lawn, batiste, dimities and the like are suitable for the better dresses, and a sash tied around, low down, and bowed in back gives it the French effect. Ginghams, cotton cheviots and similar materials are better for the knockabout frocks. The little dress is cut with front and back portions, which are tucked to yoke depth, but fall in soft folds below, and which may be arranged over a yoke lining that holds the tucks in place. The lower edge may be simply hemmed or have three tucks added above the hem as illustrated. The bishop sleeves are tucked at the upper portion and plain below the elbows. The neck is finished with a straight tucked band or collar. To cut this dress for a child of four years of age, three yards of material 27 inches wide or 2½ yards 32 inches wide will be required. The pattern No. 3902 is cut in sizes for children of one, two, four and six years of age; price 10 cents.

The middy suit shown is made of white serge banded with blue, but blue serge or cheviot with white is equally appropriate for cool weather, duck and linen in both colors for Summer wear. The trousers are long and shaped on sailor lines. The blouse is simply full with the sailor collar, that can be square or round as preferred, shield and fashionable sleeves that are pleated to form cuffs. At the left side is an inserted pocket and the collar is held by a genuine sailor's knot with ends. To cut this suit for a boy of six years of age, 4¼ yards of material 27 inches wide, 2⅜ yards 44 inches wide or 2⅛ yards 50 inches wide will be required. The pattern No. 3922 is cut in sizes for boys of

3922 Boy's Middy Suit,
4 to 10 yrs

4, 6, 8 and 10 years of age; price 10 cents from this office.

Hanging Out Clothes.

It is nearly as essential to hang out things properly as to wash them well. If big things, such as table and bed linen, dry out of shape stretching and pulling them straight wears them more than use. Hang sheets, table cloths, towels and napkins across the line, ends down. Warp threads are so much stronger than filling that if things are habitually hung crosswise, they will certainly split along the fold. Indeed, all washable things should be hung out that the weight while wet—which is thrice the weight dry—comes upon the lengthwise threads. To do this with skirts, shirts and made garments generally, get a strip of clean inch-square deal, some wooden barrel hoops and plenty of good-sized screw hooks, along with a few picture hooks. Saw after the manner of a coat hanger. For shirts the deal ought to be long enough to reach a little way in the sleeves. Fasten the neck-band and slip the hook over the line. Thus a full-size shirt will be properly dried and aired in about six inches of line space. The barrel hoops are for skirt hangers. Tie stout twine so it makes a knotted cross in the middle of the hoop, and slip a picture hook under the cross. Then fasten the skirt band, put the hoop inside the skirt, and hook upon the line. The line must be extra stout, and properly braced for such hangers, as they mean extra strain through quadrupling its drying capacity.

Whether hung on hangers or simply a line, take pains to hang out shirts so the bosoms will not drag. Once the several thicknesses pull apart and dry in creases, it will be hard work to get them back into shape. It is the same with cuffs and collars. Snap them out straight and hang so warp and woof pull true. All these stiff and polished things need to get bone dry before starching. They also need to be well wet in blood-warm water before rubbing. Stiff linen is nearly as breakable as cardboard, especially the fine sorts used in good shirts.

IS THERE any Pure White Lead nowadays? Yes, and it is made in the old-fashioned way by the "*old Dutch process*" of slow corrosion.

The brands named in margin are genuine, and, with pure Linseed Oil, they make the only durable and satisfactory paint.

For any color or shade required, use NATIONAL LEAD COMPANY'S Pure White Lead Tinting Colors. Pamphlet sent free upon application.

National Lead Co., 100 William Street, New York.

Abimelech Higgins's Way.

The Peace-on-earth-good-will-to-man Society of Peachem was holding its regular weekly session, and every woman there was busy patching old garments and cutting out and sewing up new ones, or was otherwise industriously engaged in one branch of that charity which we have Scriptural authority for believing is greater than faith and hope.

"These pantaloons," remarked the wife of the postmaster, bringing a pair of emaciated trousers from a basket and holding them up for the inspection of the society, "is a perfect shame. 'Tisn't that I object to that kind of charity, or any kind for that matter, but I do hate to see a woman let her husband wear clothes till they ain't fit for a self-respecting scarecrow to appear in public in."

"Even a cupful of cold water in charity, Sister Carroll," ventured the wife of the tailor, a gentle little woman who never harbored an unkind thought against a living creature.

"Of all women, you ought to be the last to advocate men's wearing their clothes too long," tartly responded Mrs. Carroll.

"Sh—sh," came from the wife of the druggist, who held up a reproving finger. "Charity begins at home, and we shouldn't quarrel among ourselves."

"Faith, hope, charity, these three; but the greatest of these is charity," said the wife of the pastor.

Mrs. Carroll smiled, letting the smile include the wife of the tailor.

"Whose pantaloons was these?" inquired Mrs. Sneckles, the wife of the grocer, reaching for the garments, quite regardless of the ethics and relevance of Mrs. Carroll's story.

"Mrs. Higgins sent them in," explained the secretary of the society.

"Oh," smiled Mrs. Sneckles, giving the trousers a vicious jerk, "they're Abimelech Higgins' old pants, air they? Well, I'll bet a cooky if Marthy Higgins got them out of the house without a fuss it was when Abimelech was unconscious or away from home. He's closer than the skin on the back of your hand, and I don't believe he'd give up a single stitch of his old rags for an angel to wear, saying an angel would wear such."

"Charity, charity!" chorused a number of the ladies.

"Charity be flusticated," replied Mrs. Sneckles, recklessly. "Charity may be greater than faith and hope, but justice is greater than the three of them, and I'm going to speak my mind about Abimelech Higgins though the whole firmament of the heavens caves in. He's got more money than any two people in the community has got and does less good with it than all the rest of us put together." A statement somewhat vague, but Mrs. Sneckles was careless of the quality of her ammunition so long as she succeeded in bringing down her game. "And he's getting worse every day of his life," she went on. "I've knowed him ever since he wasn't more than knee-high to a hop-toad, and he didn't use to be a bit like he is now. I mind mighty well when he married Marthy Biggs, one of the sweetest girls that ever lived, he give her a set of earrings and breastpin that cost $15, wholesale, and for a long time he treated her as if she was a real human being. He used to have a way of keeping her in pocket money by letting her have the extry dollars he would git selling anything. For instance, if somebody offered him $30 for a cow, Abimelech would dicked and dicker—he was the everlastin'est dickerer, anyway—till mebbe he would squeeze out $31 or $31.50 or mebbe $32, and when he come home he would put the 30 away and give Marthy the balance, 'jest to make it even,' as he always said. Of course Marthy never got more than $4 and 90 odd cents, according to what Abimelech got, but she got it a good many times in the course of a year and so made out to git along without having to ask him for money, which no woman that has any respect for herself likes to do, and no man with any respect for her ought to let her do. As he got older he began to git closer and meaner with Marthy, though he called it 'necessary economy,' and the extrys come along so few and far between that Marthy began to look shabby, and bimeby stopped coming to the meetings of this society, as you all know, and I'm telling you now what the reason was, if you hadn't guessed it before."

The members of the society, by this time, had quit sewing to listen to the narrative of Mrs. Sneckles, and though she paused at this point no one ventured to say "Charity" to her—the watchword of the society, and the warning cry to the thoughtless of speech.

"But the meanest thing he ever done," resumed Mrs. Sneckles, "was when he sold that farm down on Sand Creek. You know it was a fine farm and he got $10,000 for it, with some extry for a passel of odds and ends he insisted on having pay for, so's all that was coming to him, with the two cents for the stamp on the check that the man who drawed it didn't have at the time and Abimelech let him have, was $10,249.98. He told Marthy what he got for it—his telling her most everything is his only redeemin' trait—and being that she needed a new dress and other clothes and shoes and stockings and a bonnet, and the children all needed clothes, and she hadn't had any extry money for she didn't know when, she thought Abimelech would let her have something out of it, jest to make it even, if for no other reason. Ten thousand dollars was enough for him, anyway, for there was a whole lot in morgidges besides, and so Marthy dreamed of the new things she was going to get till her cheeks acchuly began to redden and her eyes to shine like they used to. She was hoping she would git the whole $249.98, but if she didn't she knew of so many nice little things she needed that she could get for the $49.98; but if she didn't get that she could get the children something for the $9.98, and even if she didn't get that 98 cents would buy enough calico to make the two little girls new dresses to wear to school. I really don't know what some women is made of. I know I ain't made of it, for before I'd 'a' done like Marthy Higgins I'd chased Abimelech off the place with a broomstick.

"Well, Abimelech come home that day at noon with the money to let Marthy see it before he put it in the bank, and she was looking mighty cheerful, and had a nice dinner for him that she raised in her own garden and cooked herself, for he couldn't afford to have a hired girl, so he said. He come back in the dinin'-room where she was and spread it all on the table before her, and counted it out in five hundred-dollar bills, and hundreds and fifties, and tens and fives, and twos and ones, and on down to the nickels and coppers till the very last cent was in the pile

"'There's $10,249.98, Marthy,' he says, drawing out the figures between his teeth like he was eating molasses candy.

"'Oh, Bim,' says Marthy—she always called him Bim—'ain't it perfectly lovely?' And she reached out for it as if she wanted to hug it to her bosom, but Abimelech, he put his hand out and stopped her.

"'There's only one thing lackin',' says he, looking at her like a sheep-killin' dog.

"What's that, Bim?' she asked, kind of trembly, because she was afraid he was worrying about what he was going to give her.

"'Two cents, jest to make it even, Marthy,' he said. 'Ain't you got that much somewheres around that you can give me?"—W. J. Lampton, in Saturday Evening Post.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

Apple Butter.

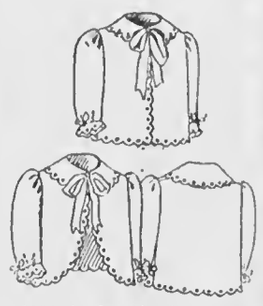
"The madame" wants a recipe for apple butter. Can you supply one? N. G. V. New Jersey.

This should be made with new cider, fresh from the press, and not fermented. Fill a porcelain-lined kettle with cider, and boil until reduced one-half. Continue this until you have enough for quantity of apples, boiling the cider the day before making the apple butter. To every four gallons of boiled cider, allow a half-bushel of nice juicy apples, pared, cored and quartered. Fill a large kettle with the boiled cider, add as many apples as can be kept moist, and cook, stirring frequently. When the apples are soft, beat with a wooden stick until they are reduced to pulp. Continue to cook, stirring continuously, until the consistency of soft marmalade, and dark brown in color. If it becomes too thick, add more boiled cider; if too thin, put in more apples. Add ground cinnamon and nutmeg to taste, 20 minutes before taking from the fire; no sugar is used. Put into stone jars, and when cold cover closely, and store away like any other preserve.

Comments on "A Busy Life."

Reading in your issue of August 24 about one woman's "Busy Life" has made some of us farmers' wives, who thought we worked hard, feel that we are like the lilies of the field, which toil not, neither do they spin. It really takes away one's breath to read of the hundreds of bushels of corn she husked, the hundreds of cords of wood she piled up, of her spinning and weaving, table linen, carpets, "men's wear" and women's dresses, sheets, etc. She tells of getting up at four or half past, Summer and Winter, building her own fires, milking from four to eight cows, making garden, pulling flax, digging potatoes and cutting corn. Where in the meantime was the man she married? We are sadly wondering if she was not too efficient, and if in addition to her own wearing duties as wife and mother she did not invade the man's realm and shoulder most of his responsibilities. Is hers an example you would have us all follow? We believe it is right for wives to do their share in bearing burdens, but do not see the necessity for their having a monopoly in that line.

3894 Infant's Wrapper, One Size.



3899 Infant's Sacque, One Size.

I once knew a clergyman and his wife who taught me a lesson. Like the Martha, whose letter was quoted, this wife was up early, would attend to all fires, shovel the walks in Winter and usually have her washing done before her husband would rise, at half past eight perhaps, and eat the good breakfast always ready for him. Then he would take a long brisk walk for his exercise, after which he would seat himself in his study to read or write at his leisure. He was a good man, and might have been a good husband if she had not spoiled him by waiting on him as if he had been a lord, and she simply a servant to drudge for him. She was a "Hannah Jane," and "rubbed herself quite out." Did he appreciate her sacrifice and honor her for it? Nay, nay; he was so used to it that he took it as a matter of course. When he went into cultured society he never thought of her going with him. To tell the truth, he would have been ashamed of her if she had, for she had grown careless of her personal appearance, was angular, ill-dressed and homely. Though good as gold at heart, she was destitute of the outward charm of gracious womanhood which clings about the loved and honored wife. Is it not a sad truth that it is not those who do the most for one who are best loved, but those for whom one does the most? This woman who writes so—dare I say boastingly?—of the work she has done in her 58 years, says *work does not kill*, but she also says that three of her eight children died when "small." Can she be sure that work did not kill them? When we read her account of her life we can only wonder that any of them lived. The strongest machine made of iron is limited in its power. We had thought the delicate machinery of the human body was much more so, but it would seem there was no limit to work in the strenuous life of the woman who says to her weaker sisters that work does not kill. Well, perhaps it does not, but are we wrong in thinking that a wife and mother, bearing and rearing children, must be exceptionally strong to do her whole duty by them, and at the same time do so much of the hard, rough work that by right belongs to the stronger partner?

A FARMER'S WIFE.

THE MINNESOTA STATE FAIR.

The State Agricultural Society of Minnesota has reason to be proud of the fair this year. Since the Society stopped perambulating about the State, holding the fair first here, then there, and settled down on permanent grounds at Hamline (midway between St. Paul and Minneapolis), their annual exhibition has steadily improved. Since pool selling and beer have been driven off the grounds, the fair has been a paying institution. Last year, after all expenses were paid, there was a surplus of over $18,000. This year the total attendance was 185,584, a gain of over 49,000 over last year. The weather was good during the entire week till the last afternoon, when it turned cold, and toward evening began to rain. Among the novelties noticed was a one-horse tread-power for running farm dairy separator. This power, instead of the ordinary iron wheels under the lags had all the lags fastened at each end to an endless rubber belt, which ran on an endless chain of wooden rollers. This arrangement made an almost noiseless power, and seems to be a great improvement over the old styles. The Deere Co. showed a corn planter which, instead of the common revolving plates with round holes for dropping the corn, had plates with long slots and a V-shaped slot above the openings in the plates, which caused the kernels to slide down and enter openings in the plates edgewise. Each hole or slot in the plates was large enough to hold but one kernel of corn, and the plates could be arranged by a gear to run so as to drop one, two, three or four kernels in a hill as desired.

The number of gasoline engines displayed would seem to indicate that this kind of power is becoming quite popular with the farmers. There were gasoline engines running thrashing machines, corn shredders, feed cutters, grinders, electric light plants and hay presses. The American Grass Twine Co. had a display of binders using grass twine, also carpets, rugs and chairs made from grass. This company has purchased the Woods harvester works in St. Paul, and is making binders which use grass twine instead of the ordinary binding twine. The binder is the same as the Appleby binder in common use, only that the knotter hook and twine disks are made larger to accommodate the larger twine. It is claimed that this twine will stand a strain of 90 pounds, and costs but two-thirds as much as ordinary binding twine, basing the comparison on the number of feet or the number of bundles bound.

The live stock exhibits were better than ever before. There were twice as many sheep as last year. Great interest centered in the cattle sales held daily by the Shorthorn and Hereford associations in the big tent. On Friday an imposing procession of all the prize winning horses and cattle marched around the race track. The display of fruits, grains and vegetables in the new agricultural building was nothing short of wonderful. One exhibit in the form of a fort covering a space of 20 feet square, and all made of Minnesota apples, has been engaged to go to the Exposition at Buffalo. The separate county exhibits were remarkable, and drew a good deal of attention. The fair grounds adjoin the farm of the School of Agriculture and Experiment Station, and many farmers daily took advantage of the opportunity offered them to visit the farm and grounds and school buildings. JAS. M. DREW.

BUSINESS BITS.

WE ARE in receipt of a booklet, "Piggic's Troubles," which treats of the entire category of diseases to which the hog is heir, giving symptoms and remedies. The Zenner Disinfecting Co., Detroit, Mich., will send a copy free to any swine breeder. A postal will bring it.

BLOOD tells in swine as surely as in any farm animal, and there is none in which it brings a greater profit or quicker return. Registered stock will bring more than double the price of common swine, and it costs the same to keep one as the other. Hamilton & Co., Rosenvick, Pa., offer some choice Poland Chinas, Berkshires and Chester Whites. Write for circulars and prices.

NO DOUBT many of our readers will have this paper delivered at the door by one of Uncle Sam's free rural mail delivery carriers. We know that there are many free delivery routes in the territory covered by our circulation. Those who are not now enjoying these privileges and blessings will soon be in their full enjoyment, for certainly the Government will not take a step backward, and free rural mail delivery has come to stay. All the Government asks is that the patron supply a suitable and approved box into which and from which the carrier may deposit and collect the mail. If you are now on a free delivery route, or if one is soon to be opened up by your place, it will pay you to correspond with the Bond Steel Post Co., Adrian, Mich. They are the people who make all the city mail box posts for the U. S. Government, and need no further endorsement.

Wants, For Sale or Exchange

Farm Managers, Gardeners, Buttermakers, etc., always on hand. No charges to employers. Write us Rural Science Agency, Durham, N. H.

WANTED—Copy of THE RURAL NEW-YORKER of August 16 1890. Address PEOPLES SUPPLY CO., Kansas City, Mo.

WANTED—Cheesemaker in private creamery by the year, who understands making light skim cheese. State age and nationality. F. H. GATES & SONS, Chittenango, N. Y.

VALUABLE FARM FOR SALE.—1,000 acres, susceptible of many subdivisions, situated on Dan River, with much river, creek and branch bottoms; nine miles from Reidsville, N. C., a town of 5,000 people, on the main trunk line of Southern Railway Company, in county of Rockingham, Piedmont section. Splendid six-room mansion, and numerous tenant settlements. JOHN T. PANNILL, Reidsville, N. C.

Money-Making Farms

BORDER the Kennebec Valley lakes; dairy, sheep, stock, fruit, poultry; near railroad, schools, churches; comfortable buildings, shady lawns, fine fishing and boating; $10 an acre; fare by boat, $1.75 from Boston Particulars free. E. A. STROUT, 9 Scott Street, Augusta, Me.

For Sale—Gentleman's Farm.

One hour from New York City by Central Railroad of New Jersey. In close proximity to a growing town. No malaria. Good society. About 140 acres, in two farms, mostly in grass. This year's first crop 235 large two-horse wagon loads of hay; second crop very promising. Home market. Modern buildings. Chance for speculation in building lots. Owner having taken up his residence in Europe, will sell this place below value. For circular address owner FREDERICK LOESER, Personal, 484 Fulton Street, Brooklyn, N. Y. Real Estate Agents please enclose their card.

For Country Readers

The farmer of to-day is not a "man with a hoe." He is an intelligent, progressive citizen, admittedly of higher average intelligence and patriotism than the urban inhabitant. His home is in direct communication with the centers of distribution of things produced therein in return for what he provides them.

We are producing something that will be appreciated by him, and are seeking its distribution along the rural routes.

THE CURRENT ENCYCLOPEDIA is a work that has been indorsed by all who have examined it as indispensable aid for all intelligent people. It appeals most strongly to readers over the country. It treats of all topics that are of interest to everybody everywhere. Besides the knowledge of the world it thus furnishes it has contributions on agricultural subjects treated by national authorities. There have already appeared interesting articles on Corn; Forestry, Kaffir Corn, the Agricultural Department (by A. C. True); Irrigation (by T. H. Newell, U. S. Hydrographer); Alfalfa and Horticulture (by Prof. L. H. Bailey); Wheat (by Prof. R. F. Falkner). Other subjects will be taken up from time to time and dealt with in the same manner.

Now is the time to arrange for Fall and Winter reading. The price of **The Current Encyclopedia** is very moderate, and as we wish to introduce it widely, we shall be glad to hear from every reader of this invitation to whom we shall give the benefit of a special offer. Write at once: THE CURRENT ENCYCLOPEDIA, 125 East 23d St., N. Y. City, N. Y.

A Carving Set.

Every family needs a carving set three times a day. This set consists of a Sheffield carver with eight-inch handmade

steel blade, buckhorn handle, fork and steel. Price, $1.90; or we will send it for a club of two new subscriptions at $1 each and $1.25 extra money, or free for a club of six at $1 each.

FEEDS AND FEEDING

NEXT WINTER it will be necessary for our farmers to study the question of stock foods. Corn, the great stock grain, will be high in price, and substitutes must be provided for it. How can these substitutes be found? Only by comparing other and cheaper foods with corn, and knowing beforehand how they will affect the animal. This comparison may be done by studying analyses, but a farmer cannot afford to spend the Winter in experimenting. He must know beforehand what others have found out. He can learn this by studying Prof. W. A. Henry's great book. Feeds and Feeding tells you just what you ought to know about foods and how to feed them. It is full and complete, and easy to read. Price, $2.

Sold by THE RURAL NEW-YORKER, NEW YORK.

PROF. W. A. HENRY'S GREAT BOOK.

BOOK BULLETIN

FOR SALE BY THE RURAL NEW-YORKER

FRUIT HARVESTING, STORING AND MARKETING, by F. A. Waugh. A practical guide to the picking, sorting, storing, shipping and marketing of fruits. Illustrated; 250 pages. Price, postpaid, $1.

TURKEY CULTURE.—A pamphlet of 100 pages, giving the experience of successful turkey raisers. Price, postpaid, 50 cents.

THE CURRENT ENCYCLOPEDIA.—Those who desire to keep in touch with modern events are often at a loss to find reference works that are up to date. History moves on at automobile speed; the maps change day by day, and the obscure town or country of to-day is the spot upon which all eyes are fixed to-morrow. Economic changes are no less rapid than political. A serial reference work is really needful, and this want is supplied by the Current Encyclopedia. The August issue contains, among other valuable papers, copious illustrated articles on the Department of Agriculture by A. C. True, Director of U. S. Office of Experiment Stations; Alaska; Argentina; coinage; Congress; Nicaragua Canal; Nile dam; Oklahoma; trades unions, etc. The September issue will give first authentic statistics of the wheat crop of 1901, a full history of Venezuela, and a quantity of other timely matter.

MARKET NOTES

POOR FISHING.—From present indications prices for prime salt mackerel will be very high during the coming season. The catch of the New England fleet to date is only 58,000 barrels, 16,000 less than for the same period last year. A large share of the catch from the Maine coast has run 150 fish to the barrel, and sold as high as $15.50. Of course, these were extra large fish, as ordinary sizes run from 250 to 350 per barrel.

WHY VARIED PRICES?—A correspondent wishes to know why some varieties of beans are quoted so much higher than others on the same day. At first thought it might seem that the quality and nothing else makes this difference, but supply as well as quality has a hand in it. Now and then one will be surprised to find that on account of great scarcity of goods of an inferior grade, the price for a short time will jump above those of higher quality. It may appear strange that anyone should pay more for an inferior article than a better one, but this is easily accounted for by the tastes of individuals, and also of classes, where great crowds of one nationality are massed together in cities. There are certain varieties of cheese, for instance, which in stores and markets are securely confined under glass covers out of consideration for the traveling public, yet there are people in full possession of their senses who are extremely fond of them, and they sell for very high prices.

MORE ABOUT PACKAGES.—A few peaches come in a package which carries well but is not economical, so far as space is concerned. It consists of two eight-quart, inverted-bell baskets, fastened side by side in a frame resembling the common bushel crate. A method of shipping grapes which is growing in favor each year, particularly for early grapes or fancy sorts, is the use of an oblong carrier containing eight baskets holding between two and three pounds. This is really a diminutive peach carrier. Another size of the same style contains eight 3½-pound baskets. Most of the grape crop, however, comes in handled baskets containing four and eight pounds, respectively. The Niagara, Delaware, Salem and Catawba are put in the smaller sizes, and sell at a higher proportionate price than Concord. Just why this is so is hard to tell, unless because the Concord is so much more plentiful than the others. Certainly the quality of well-ripened Concords is not inferior to Niagara or Catawba. A great many Catawbas, however, are stored, on account of their long-keeping qualities, being sold during the holidays at high prices, and for this purpose the large basket would not be suitable. Niagara has the fault of losing its flavor under storage. I have tested specimens which looked perfect, and yet were as insipid as sweetened water. Of course, this may have been more the fault of the storage than the fruit.

BARGAINING.—The conversations heard around the retail fruit markets are often amusing. Some of the sellers indulge in the most unblushing prevarications, but, as the buyer immediately discounts them 100 per cent, no particular harm is done except to give an additional thickness to the sole-leather tan on the dealer's conscience. I recently saw a man who wished to buy a small quantity of plums, and here is the way the matter was talked over:

"How much for them plums?"

"Half a dollar."

"Be they sound?"

"Sure, every one of them. Here, just look at them," tilting the basket in such a way that the least possible light was admitted. "You ain't buying no pig in a bag. They're all right."

"Here's a rotten one."

"O, well, what do you expect? One speckled plum in a basket! That's nothing. Well, take it for 40 cents, as that's the last one. They cost me 45 this morning."

By this time the buyer had handled over the top layer and found several decayed plums underneath. He showed these one by one to the dealer, who kept saying alternately, "I tell you they're all sound," and; "O, well, what do you expect? One rotten one in a basket!" Finally the buyer concluded that they would not do, and he went on, the dealer calling after him: "If you can find any better I'll treat you." Probably that was a safe offer, as nearly all of the eastern-grown plums that I saw that day were badly decayed. At one store was a pile of 25 eight-pound baskets of what were claimed to be Green Gages, so rotten that it was doubtful whether one sound basket could have been sorted out of the whole lot. They were probably too near ripe when shipped, and had been standing around too long. The California plums, which keep so well, are packed so that every layer is separate. The fruit is not jammed in putting on the covers, and there is a circulation of air. W. W. H.

PAN-AMERICAN EXPOSITION NOTES.

LOUISIANA.—Louisiana has one of the largest as well as one of the most representative exhibits in the Agricultural Building. Almost every product of the farms of the State is shown. Perhaps the most conspicuous is that of cotton. There are bales of marketable sizes, showing the best grades of cotton, from the long staple or Sea Island to the short upland grades. Among them is a sample of brown cotton, which will doubtless be new to a great many who do not know that there is a variety of cotton which naturally has this color. There are about 50 varieties grown there. The output of 1900 was valued at about $37,000,000, which shows that it is the leading product of the State. The sugar industry comes next in importance, as it yields annually about $30,000,000. It is illustrated by photographs of the fields showing the methods of planting, harvesting, and all the other operations necessary in reducing the cane to the finished product. Samples of the cane are also shown. It may not be known to many that the tropical cane from which sugar is made does not make seed, and hence it cannot be propagated except by planting the stalks, which take root and grow, a sprout coming from each joint. A plantation lasts about three years, after which time the vitality of the stock is so low that the field has to be broken up and replanted. Rice in all its various forms is shown, from the grain in the sheaf to the product ready for market. The grain in the head looks very handsome, and is well worth seeing by those who are not familiar with it. There is also rice flour, which is used for making various kinds of baked articles, the bran has its use as stock food, and the straw for paper; in fact, all the products are put to some good use. Formerly all the rice that was grown in Louisiana was near the Mississippi River, where the water was siphoned over the levee to the rich bottom lands, but now it has been found that there is a vast area, which is mainly on the prairies of the southwestern part of the State, where there are thousands of acres already devoted to rice culture and millions more that can be so used. The industry has grown from a very insignificant stage until last year the annual crop was worth about $10,000,000, which is more than all the product of the Carolinas and Georgia, where rice was formerly grown more largely than elsewhere within the United States. A variety from Japan is now the leading one grown, and the introduction of this has been a great stimulus to the industry, because it can be milled through much more easily than the old varieties. Sweet potatoes of the very best quality are shown, and also the two grades of Irish potatoes, which are fast becoming one of their leading market crops.

Some of the best pecans in all the country are grown in southern Louisiana. Fifteen varieties are shown, and some of them so large as hardly to be recognized as pecans. They also have very thin shells, and orchards are being planted to such an extent that these choice varieties will soon make quite a showing upon the market. The display of fruit models is excellent. While the apple is not one of their leading fruit crops, still there is a very good representation of this fruit, as there is also of peaches, pears, grapes, Japan plums and persimmons and many other kinds of fruit which are shown to good advantage, and which makes it evident that no one need starve for fruit in Louisiana. Corn of the best quality is also displayed, and the cow pea is shown in a great many varieties. This latter is one of the most valuable crops grown, not only for the peas for use as an article of food, but because of the beneficial effects of the crop from the soil, especially when the vines are plowed under. Fiber plants have quite a conspicuous place, especially the native moss, which grows upon the trees in immense quantity. When the farmers or any of the laboring people run out of other employment, they can go to the woods and pull moss, put it in some pond or stream where it undergoes a process of decay and after being taken out and dried, is almost like horse hair, and has a steady market value. Beautiful specimens of jute and ramie are also shown. The former is the material which is used in making coarse bags, and the latter is almost as fine as silk and is used in making fine fabrics. The oyster farms of the State are also represented by specimens of the shells showing the different market sizes, the young spat just caught upon articles found in the water, and jars of the edible part. On the whole, the exhibit from Louisiana will fully repay the visitor quite as well as any that I have seen. A very intelligent and painstaking man is in attendance to explain all these exhibits.

NEBRASKA.—Nebraska has a small but very handsome and interesting exhibit. Perhaps the main feature is an allegorical representation of the world, which is explained in a most fitting, entertaining and instructive manner by Col. Randall, who is in constant attendance. This part of the exhibit is arranged on the wall in circular form. The outside, which is composed of grasses and grains in the sheaf, is supposed to support all the rest, especially the animal kingdom, which feeds upon them. Agriculture has been, is, and always will be a business because the consumption of the products is continuous. The farmer will never be out of a job. His work goes on in part while he sleeps, and he has this advantage over the mechanic whose income ceases when his hands are idle, while the farmer's crops grow whether it rains or shines, whether he is sick or well, excepting, of course, the crops which are neglected or some serious calamity that may befall them. The larger circle is made of ears of white corn, which Col. Randall happily says represents the white race, and it dominates the world. Inside of this are various colored ears of corn, red, brown, yellow and speckled, which represent the other nations of the earth. They are more for show than utility, so the Colonel says. The visitor will be pleased carefully to examine the Nebraska exhibit, as well as listen to the words of instruction and good advice given by our friend.

IDAHO.—Of all the State exhibits in the Agricultural Building that of Idaho is perhaps the most artistic. It is not large, but the plan and the manner of decoration are at once unique and exceedingly pleasing. The design and the carrying out of it are the work of Mr. and Mrs. Wessels, of Idaho, who are old hands at exposition work, and their efforts here have certainly been worthy of their skill. To them the credit mainly belongs. Various cereals and grasses of the State, which are many, have been used in the most effective way. There are grains shown in jars, and also some fresh vegetables, which prove what the State can produce. I think some of the onions would weigh a pound or more each, which is fully equal to those we import from foreign countries.

MANITOBA.—Manitoba has a large and handsome exhibit. Wheat, flour and cattle being their main exports they are in the foreground. The display of wheat is mainly of one variety, which is the Red Fife. It is a Spring wheat, has a hard grain, and makes an excellent grade of flour. It is said by those in charge of the exhibit to make 20 loaves of bread more to the barrel, than flour made from any of the soft wheats because it is drier, contains more gluten and will absorb more water. The native and cultivated grasses, barley and oats, of which there are 25 varieties of the former shown, are also nicely displayed. The pasturage for cattle on the native prairies, and in the woodlands to some extent, is said to be almost without limit. Very little oats or barley is exported, these grains being kept at home and fed to the stock. Flax is also largely grown for the seed, but not for the fiber, and a handsome display is made of this both in the sheaf and of thrashed seed. One notable fact that was stated by the attendant was that almost every season a part of the harvest is never gathered because of the inability to secure sufficient laborers. This year 20,000 men were wanted to help harvest the crop. From $50 to $65 per month and board were offered as pay this year, but usually from $30 to $40 is the ordinary price. Of course, this state of things exists only for two or three months during the busy season. The railway stations are watched and every one who gets off the train who is at all likely to want work is at once besieged by the farmers to engage his services.

HEART-SICK.

There are a great many people who have heart sickness, who have no chronic derangement of the heart. When the stomach is diseased it may affect many other organs, and produce all the evidences of diseased heart, diseased liver or kidneys, or disease in some other organ.

The inexperienced practitioner treats the wrong disease, and hence the constant statement of Dr. Pierce's correspondents: "Doctors could not help me."

Doctor Pierce's Golden Medical Discovery cures diseases of the stomach and organs of digestion and nutrition. It increases the assimilative powers, and purifies and enriches the blood. When diseases of organs remote from the stomach are caused by the stomach, the cure of the stomach results in the cure of the other diseases, in heart, lungs, liver, kidneys, etc.

"Six years ago my stomach and heart troubled me so much I had to do something, as the doctors could not help me," writes Mrs. S. A. Knapp, of San Jose, California, Box 392. "I went to San Francisco and had treatment for catarrh of the stomach, and was better for some time, then it came back. I then used Dr. Pierce's Golden Medical Discovery and 'Pleasant Pellets.' These medicines cured my stomach. I do not have the pain and indigestion as I did. It is very hard for me to tell you what I suffered before I commenced taking your valuable medicine. I recommend it to all the sufferers whom I meet."

To cure constipation use Dr. Pierce's Pleasant Pellets.

THE CHAIN-HANGING

Cattle Stanchion

The most practical and humane Fastener ever invented. Gives perfect freedom of the head. Illustrated Circular and Price free on application. Manufactured by O. H. ROBERTSON, Forestville, Conn.

SPECIAL PRICES 30 Days' Trial. Guaranteed. Double and Combination Beam. OSGOOD SCALE CO., 103 Central St. BINGHAMTON, N. Y.

Catalog Free. Write now.

Best Gall Cure on Earth

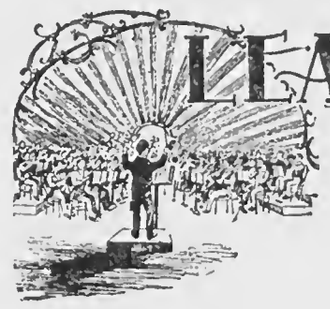
Mailed anywhere for 50 cents.

MOORE BROS., Veterinary Surgeons, Albany, N. Y

LUMP JAW

Easily and thoroughly cured. New, common-sense method, not expensive. No cure, no pay. FREE. A practical, illustrated treatise on the absolute cure of Lump Jaw, free to readers of this paper.

Fleming Bros., chemists, Union Stock Yards, Chicago, Ill.



LEADING

and Gaining Ground with Every Trial.

Veterinary Pixine

is of powerful potency. Irresistable and unfailing; penetrates to the depth of sores and heals by granulations, not by drying and scabbing as do mineral preparations. Cures scratches that defied treatment for years; grease heal and old sores when all known treatment fails; hopple chafes and galls while horse works, and all skin diseases on domestic animals. Money returned if it fails. It is the only absolutely guaranteed scientific Veterinary Ointment on the market.

PRICE { 2-oz. box, 25c. / 8-oz. box, 50c. / 5 pounds, $4. } At all Druggists and Dealers, or sent prepaid.

TROY CHEMICAL CO., Troy, N. Y.

Live Stock and Dairy

A FIELD OF RAPE.

Fig. 291 is a very good illustration of what the rape plant will do under favorable conditions. This piece of rape was sown in a portion of an old orchard that had been used for hog pasture for several years, and is generally in a very good condition as regards soil fertility. We sowed this field of rape on May 15, for the use of the lambs when they should be taken from the ewes, a little later in the season. The photograph was taken by the writer on July 14, about eight weeks after sowing. The young man in the photograph stands something over six feet tall, so the rape is easily about 36 inches high, which is what I consider a very good growth for this length of time. Of course the land was good, and the season has been sufficiently favorable, with plenty of rain, so that the crop was given a good chance; possibly better than the average farm and season might afford. But at the same time this will show what ought to be expected from the rape plant under the proper conditions.

The week following the day the photograph was taken the lambs were turned in, and now the field presents quite a different appearance. The leaves have been well eaten off for the most part, and new leaves are starting out on the old stems that will make fine pasturing later on. We have later turned some calves into this plot, and they, too, like rape, and are consequently doing well and looking plump, as though they were in clover. We have, also, been cutting an armful two or three times a day, and feeding to an old sow that is soon due to farrow, and which for various reasons we are unable to put out at pasture. The sow eats the rape greedily, and doesn't tire of it either, even after four or five weeks' feeding. Later in the season it is not improbable that we will turn the sow and litter into this rape, or a portion of it, and they will do almost as well as they would in a clover pasture. We have had a considerable experience with rape, even to feeding to milch cows in small quantities, and have found it to be a very valuable farm crop, and one that we would not care to attempt to get along without. More farmers should raise rape. It is a crop that actually the farmer cannot afford to get along without. Fig. 291, this page, shows very well what rape can be made to do plainer than either words or pen could put it.

NOTE ON POULTRY DISEASES.

For many years I have watched poultry keepers and have kept poultry myself, but I have never known so many sick fowls as during the past year. We are all unable to ascertain the cause of the trouble. Many think it is because the fowls have been kept on the farms so long that the premises have become filthy, etc. This view is not clearly proven, for some of the heaviest losers are those who have been the shortest time in the business. Those who have kept fowls for years are about equally divided, some are losing and others escape. I mention this to show that even the poultry keeper, who has, by many, been supposed to be free from trouble, and only needing to gather the eggs and receive the money, may need a little sympathy at times. When a man loses from 75 to 90 per cent of his flock of hens, he forgets what a lot of money he made last year from them, and begins to say as I heard one say the other day: "If I can't have anything without hens, I won't have anything." These heavy losses of poultry which have been known in these parts for only a year or two, remind me of the reported experience of a certain eastern New York business man, who undertook to get a large flock of fowls by purchase. He engaged an experienced poultryman to take charge, and everything went well for a few months. Soon it was discovered that disease was among the fowls. Losses were heavy. Everything, so far as they knew, was done to stamp out the disease and save the flock, but before the ravages of the disease could be stopped, the flock was so far gone that it was decided to abandon the enterprise. It was also feared that the soil where the poultry had run might be contaminated and that succeeding flocks might thus become infected. What can be done when trouble comes to the flock of hens in this manner? I am not authority. I have read much and have seen the poultry keepers and tried to find out from them. Numerous remedies have been tried. So far as I can learn the best method seems to be to use substances which tend to prevent trouble. Many use sulphur, charcoal and salt in the mash, use gypsum (land plaster) on the dropping boards, and lime wherever it will answer without affecting the manure too much. There is little doubt now that a judicious use of lime is one of the best means of preventing disease that we have. These methods, together with care in feeding, which includes letting up on the amount of corn fed, and the removal to a distance of all ailing hens, and removal of droppings from birds that are affected, or better, all droppings, will be the best that one can do. Stamp out disease by "eternal vigilance."

H. M.

A FIELD OF RAPE. FIG. 291.

Value of Skim-Milk.

There has been some criticism about the dairy test at Buffalo, because no value was given to the skim-milk. The following statement has been made by the press reporter:

Skim-milk doubtless has a value, and the herd that gives the largest amount of milk would naturally have the largest amount of skim-milk to its credit; but against this should be charged the labor of handling, feeding or otherwise manipulating the same. Figures are given that set forth the total milk as well as the total solids, though it has been impossible to work up even this in detail, because of the mass of figures it would require. As a matter of fact, the value of skim-milk is of wide variation. Some judicious feeders value it as high as 15 cents per 100 pounds, while others are so careless and indifferent that the probabilities are that the labor of handling eats up all the profit. Commercially, the price of 10 cents per 100 might be considered a fair valuation. At the Pan-American model dairy, conditions have been such as to render any special record of the disposition made valueless to the farmer. During the first weeks that the dairy was in operation, it was impossible to make use of more than a small percentage of the skim-milk, while now it is being ripened, made into buttermilk and retailed over the counter at five cents a mug. Of course, these are conditions that would never apply to an ordinary farm or creamery.

Breeders' Directory

JERSEY BULL

Yearling—registered, from a great show cow; almost faultless, by a producing sire Farmer's price R. F. SHANNON, 907 Liberty St., Pittsburg Pa.

A. J. C. C. JERSEYS.

A fine lot of young Cows in milk, Heifers one and two years old, dry, and some Calves and three Bulls for Sale. Farms rented without stock.
A good chance if you want Registered Stock and mean business. 100 head in herd.
Mention this paper. M. S. WILCOX, Jefferson, N. Y

123 HOLSTEINS all ages, for Sale
DELLHURST FARMS, Mentor, Ohio.

The EMPIRE Cream Separator

Is not a cheap machine.

It is built under the most valuable cream separator patents in existence.

The material used in its construction is the best possible to procure.

The workmanship and mechanical finish is not excelled in any line of manufacture.

It is not made or sold on a price basis.

A good article is worth a good price.

Purchasers of the **Empire** enjoy the benefit of its exceptional merit long after the price has been forgotten.

Does the business.

It skims clean and turns easy.

The bowl contains only a few parts with all flat surfaces, and is easy to clean.

The bowl is exceptionally light and easy to handle.

The mechanical parts are few and easily adjusted.

It is not **"the only"** cream separator on the market, but it possesses many advantages found in no other.

Our catalogue tells all about it. We want you to have a copy. Your address on a postal card will fetch it.

UNITED STATES BUTTER EXTRACTOR CO., Bloomfield, N. J.
WESTERN OFFICE, Fisher Building, Chicago. NEW ENGLAND OFFICE, Essex Junction, Vt.

DAIRY AND FARM NOTES.

The Price of Milk.

MILK PRICES.—Is it possible to control the price of milk and its products? There are numberless factors controlling current prices. The great law of supply and demand has always been the main influence in fixing values. It always will be. Whatever man may say or do, when markets are glutted prices will go down, and when a scarcity prevails a corresponding advance will take place. This is no new argument, but it is often forgotten by over-zealous advocates of pure theory. In a limited way, demand can be created for special products. This is particularly true of many fancy soft cheeses, such as the Neufchatel, Camembert, D'Isigny, etc., and prices in the past have been to some extent controlled by the manufacturers or dealers. Each year increases the output of this class of goods, until at present it nearly or quite supplies every demand, and they have become staple products. Any effort made to control or fix the cost to the retailer or consumer is at once met by an increased output, and the price again seeks its level, a level fixed by the value of milk for butter, which is the great American milk product. Supposing for a moment that the manufacturers of Neufchatel cheese should say to the farmer: "We will give 25 cents per 100 pounds more for milk than it is worth for butter or cheese making." Would it be long before the markets would be deluged with these soft cheeses? Or, on the other hand, presuming that the farmers who are now producing milk for such manufacturers should say to their purchasers: "We demand 25 cents per 100 pounds more for our milk, because it is manufactured into fancy cheese," what result would follow? It takes only poor judgment to decide at once that the plant must be moved or operations suspended. Yes; but the farmers say: "The consumer pays for this product more than twice its net value to us in crude milk, and we don't propose to stand it." The candid observer would at once say that these farmers were unbusinesslike, and interfering with an industry that had benefited them and their locality.

COST AND SELLING PRICE.—Still another phase of the subject is presented. At this same time prices for milk at this establishment have been very near the cost of production, and the farmers say: "We cannot produce milk at these ruinous prices, and we shall demand an increase or place our product elsewhere, even though we get less for it." Not a very wise conclusion. Supposing the manufacturer has during this same period made a good profit on our milk; does it add materially to our welfare to deprive him of his revenue under these conditions? Again, New York requires from 30,000 to 50,000 packages of butter weekly, which comes from practically the same shippers. These same shippers conclude that they must advance the price two cents a pound, and propose if the rise is not met to withdraw their supplies, and make the milk into cheese or cream, or ship it in crude milk. Is this plan consistent? It appears to me that much of the scheme to control New York milk prices has been on about the same general plan. Does denouncing a great corporation like the Borden Company, which has done more for the New York State milk producers than any other single enterprise, by way of demanding conditions which are in the very nature of the case essentials to a higher price, put shekels into our pockets? No, no; the premises are wrong. There is only one throttle by which the speed of the engine is controlled. Drilling a hole into the water tank will not check the speed. The industrial life of this country has not developed through a constant warfare to increase cost, although prices have at times fluctuated, and a small increase produced great gains, yet every student of economics of whatever degree must admit that the development of every industry in the country, the dairy interest included, has been due primarily to cheapened cost of production, meaning a lower price to consumer. If every American farmer could have impressed upon his business bump this great principle of American economic law, that industry thrives only by an expanding market, made so through a better product at reduced cost, he would have laid the foundation for an acceptance, and finally as a part of a great whole, for future success and happiness.

UNPRODUCTIVE DAIRY FARMS.—I can point to many men who have yearly added to their material interests, and produced milk at low prices. Others have failed, regardless of prices, more than to make a living. The fringe of weeds and bushes around the farm grows wider; the loss of manure continues. The farm decreases in producing power. The bulk of the food comes from a farm in Iowa. A can of milk is hauled one way and a sack of feed the other, and the feed merchant gets the profit if he secures full pay. These farms must needs buy their stock. They cannot afford to raise it, and again the cow merchant brings in the fresh stock and takes out the wornout milkers. It would be most interesting to know at just what price of milk these farms would clear up and return a profit. I am of the opinion that three cents a quart would not accomplish the result. I suppose it may be charged that this is dodging the issue, and joining hands with the so-called middleman. But fortunately or otherwise, I have had some experience as a middleman, standing between the farmer and the consumer, and I know from experience that there are many rocks and shoals in handling produce that the quiet farmer does not see, and consequently does not appreciate. The demand for cheaper milk and the sbarp competition among dealers does not permit a profit beyond that secured in other business presenting an equal hazard. A comparison may be made in our locality. The small villages of Carthage and Lowville, surrounded by farmers whose whole business is milk production, are supplied by a few men who get 2½ times for their milk what is realized by the milk seller or cheese factory patron. Why not double the amount of milk and sell at half the price? Prof. Voorhees tells us that the cost of retailing equals the cost of production. The distribution of any class of goods costs as much as the manufacture. Milk is perishable property, and hence particularly hazardous. The margins must necessarily be greater than upon wheat, which can be stored and held without loss in intrinsic value.

COST OF DISTRIBUTION.—The weakest point in city distribution is the fact that each peddler must traverse a large territory daily rather than confine his efforts to a contiguous locality. Such distribution can only be possible under trust management. Competition, personal likes and dislikes, enter into the retailing of merchandise. No one butcher supplies a given locality. The success of many a man comes from catering to one's idiosyncrasies, which carry no more nourishment to the physical body, but do affect our desires, our likes and dislikes, without which we should be on a level with the lower animals. I am satisfied that the organization, be it the result of statutory enactment, the arbitrary rules of corporate interests, or the direct result of personal and united effort on the part of the farmers, will be the only one bringing any tangible benefits to the milk producer; which has for its watchword first the production of a healthful milk, not unnecessarily rich in fat and total solids, but containing not less than 3.5 per cent fat and 12½ per cent of solids, in which germ life is not permitted to develop. We should not study how far one may go in shirking duty in care and management, which I am sorry to say prevails to a degree in the producing sections. Nor are we to study continually how far one may go in giving the least return for the money, considering middlemen robbers and thieves, and I repeat it because I hear it and read it, not because I like to do so. In my judgment it is a most narrow and short-sighted conception of business and industrial development. On the other hand, we need a policy and spirit, and organized effort, which shall say to the middleman and consumer:

"We have milk to sell. The cost of production is high. We are not in business strictly for fun, but for self-support and profit. Our time must necessarily be given over to economical production of our goods. We are unable to produce, transport, sell and collect; we must needs have assistance. We know that machinery soon wears out, besides doing ineffective work if every part does not fit and work free from friction. We know also, that this great New York milk machine, handling one million quarts a day, must run without friction to bring best results. We are ready to coöperate with you in producing good milk, and in enforcing the law against adulteration after it leaves the farm. We believe that there is dishonesty among farmers and among dealers. We demand punishment whenever and wherever found. We believe that the milk business, like other industries, depends upon the volume of business done. We are therefore willing to produce at a narrow margin, knowing well that this principle means increased consumption."

Let us take the friction out of our machinery and oil the adjusted parts until milk consumption in the great metropolis shall double and treble, giving the consumer a cheaper and more healthful food than meats, and at less cost. Establish a spirit of confidence in every branch of this enterprise. Invite our dealers and city consumers to see our barns and dairies. Discuss with them and show a knowledge and study of hygiene and germ life. If anyone reads this article he may say sentiment, sentiment; we must fight to get our rights. For all I believe in a "strenuous life," I have found that merchants were human, much like farmers, and were possessed of as much moral fiber, and as ready to live up to their obligations. They have their losses and troubles, as we do. Success is due to overcoming these difficulties, and if the middleman has greater power than we, he will succeed just in that proportion. The present plan of building coöperative plants has much to commend it, and is the only outcome as yet having any possible value, but I am not sure in the long run how successful they will be. Twenty-five years' experience in factory management teaches me that in the first place margins are small, and in the second place what profit arises will go to the man who has business tact and sagacity to make things pay, whether he is the owner or under pay from a board of directors. Build creameries; it will not be a loss if wisely administered, but remember so long as milk trains run into New York City the price will be fixed by milk values for butter and cheese, with an addition equivalent to the extra expense of hauling and loss of by-products.

H. E. COOK.

The distress, apprehension, inconvenience, and danger of Asthma, can all be overcome by Dr. D. Jayne's Expectorant if administered according to directions.—*Adv.*

Leg and Body Wash.

Race horses often become sore and stiff from continued strain on the hard tracks. Nothing takes out this stiffness and soreness like a wash compounded of diluted

Tuttle's Elixir

apply to the legs and put on light bandages. Sponge the body and put on light blanket. Guaranteed to produce desired results or money back.

Readville Trotting Park, Mass., March 23, 1900.

Dr. S. A. Tuttle, V. S.

Dear Sir:—I have used your Elixir for the past ten years, in the diluted form for a leg and body wash. I consider it the best wash for keeping horses from soring up. Horses done up with this wash are much less liable to take cold than when done up with witch hazel or any other wash I ever used. J. H. NAY.

Our 100-page book, "Veterinary Experience," FREE.

HUMOROUS

Said the merry Typhoid Microbe to the Bubonic Germ,
"Oh, I like this mode the womenfolk have started;
On the pavement, moist and wretched, one need now no longer squirm,
To a haven snug and cosy one gets carted.
People often growl at fashion, but a fashion may do good,
And the trailing skirt's beneficent, I guess,
Since it aids unlucky members of the old Bacillus Brood,"
And the Bubonic Germlet said, "Why, yes!" —Rational Dress Gazette.

BARBER: "Your hair will be gray if it keeps on." Scantylocks: "Well, I hope it will keep on."—Baltimore World.

"Is this weather good for hay?" asked the green boarder. "It orter be," returned Farmer Skimpin. "It's bin rainin' pitchforks."—Phila. Record.

"WHY should a woman take a man's name when she marries him?" "Well, as long as she takes everything else she might as well take that, too."—Philadelphia Press.

CLERGYMAN (examining a Sunday school class): "Now, can any of you tell me what are sins of omission?" Small Scholar: "Please, sir, they're sins you ought to have committed, and haven't." —Motherhood.

"I AM glad," said Willie's mamma proudly, "to hear that my little boy, chose to apologize rather than to fight." "Sure," replied Willie. "The other fellow was a good bit bigger than me."—Philadelphia Record.

TEACHER: "Now, Tommie, look at this. Is this the way to spell window—w-i-d-o-w?" Tommie: "No, sir." "What is the difference between a window and a widow?" "Well, you can see through a window!"—Illustrated Bits.

NORTHERN MAN (in Arkansas): "If you are doing so poorly why don't you get more land?" Native: "It would be a right smart trick, wouldn't it, for me to git more land when I'm jest about starvin' to death on 10 acres now?"—Leslie's Weekly.

"I SUPPOSE," said the inquisitive tourist, "that the wealth of this country is in the soil." "I reckon it is," replied the poor farmer. "I don't know nobody hereabouts that ever got any out of it, so I reckon it's still thar."—Philadelphia Press.

"THIS is a remarkably healthy climate, they say," said the Easterner. "You're right thar," said Arizona Al. "F'r instance, not long ago a tenderfoot with a weak chest an' a pale face dropped inter the 'Miners' Delight,' called me a liar an' o' course I had to clean up. 'Bout two months after a big sunburnt cowboy stopped me on the street, wiped the earth up with me an' slammed me up in a tree to recuperate. Same feller. Best climate in the world, pard." —Indianapolis Sun.

The Yeomans Fruit Farm For Sale

To close the Estate of the late T. G YEOMANS, and because of the poor health of one of the survivors.

A Rare Chance to Purchase one of the Choicest Fruit Plantations of the State at a Very Low Price. It is beautifully located, in and surrounding the village of Walworth, Wayne Co., N. Y. Embraces 135 acres of mature apple orchards, 20 acres of pears, quinces, peaches and cherries, and 200 acres of choice farm lands, all in a high state of fertility.
Orchards in perfect condition, and of most desirable market varieties. Apples are largely Baldwins.
Can be Divided if Desired.
Prof. L. H. BAILEY says: "I have always considered the Establishment of T. G. YEOMANS & SONS, at Walworth, N. Y., to be one of the best general farm properties I have ever seen. It appeals to me as quite the ideal Fruit and Dairy Farm, and these two things do not often go together."
A CHANCE in a THOUSAND for the RIGHT MAN.
T. G. YEOMANS & SONS, WALWORTH, N. Y.

No wind mill has ever met with such unqualified endorsement or sprung so quickly in popular favor. The cause is not far to seek. It is due to superior material and construction and the introduction of an entirely new and improved system. The wonderful double gear, adding double strength, double power, etc. The long bearings with interchangeable boxes which may be easily replaced without removing any part of the mill. Even distributed load. No overhanging strain or torsion. Stands the severest storms without bending or buckling. These are but a few of the leading features of the Samson. This is the last appearance of the Samson advertisement for this season. Do not fail therefore to send at once for our free Samson Art Catalogue and keep it for future reference.
Stover Mfg. Co., 502 River St., Freeport, Ills.

HORSE POWERS
Threshing Machines. Wood Saw Machines.

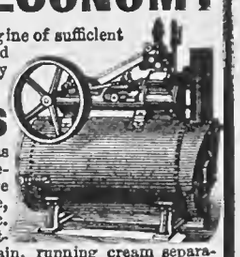
ROSS ENSILAGE CUTTERS
EXCEL ALL OTHER MAKES.
We can prove it, if given a chance.
Send for Cat. No. 44 Tells all about it.
THE E. W. ROSS CO.,
SPRINGFIELD, O.

WROUGHT IRON PIPE
Good condition, used short time only; new threads and couplings; for Steam, Gas or Water; sizes from ¼ to 12 inch diameter. Our price per foot on ¾ inch is 8c; on 1 inch 8½c. Write for free catalogue No. 51
CHICAGO HOUSE WRECKING CO.,
W. 35th and Iron Sts., CHICAGO.

POWER ECONOMY
consists first of all in having an engine of sufficient size to develop power cheaply, and large reserve force so as to run any machine easily and without drag.
Leffel Engines


excel in these things as well as others. Quick, easy steamers, require the minimum of fuel and are easy to operate. Ideal for farm use, creameries, small factories, etc. Unequaled for sawing wood, cutting feed, shelling and grinding grain, running cream separators, churns, pumps, etc. This one is horizontal—we make uprights also. Stationary and portable, 3 h.p. up. Send stamp for book. James Leffel & Co., Box 101 Springfield, Ohio.

WELL DRILLING Machines
Over 70 sizes and styles, for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.
WILLIAMS BROS., Ithaca, N. Y.

Improved Kemp Manure Spreader

This is the only machine made that will spread evenly and perfectly all kinds of manure, wood ashes, salt, lime, etc. Tears apart, makes fine and distributes evenly the hardest, caked and coarest manure, no matter how full of straw, corn stalks, etc. Machine is greatly improved for 1901. The driver does not have to leave the seat from the time he leaves the manure heap until he gets back again. Send for latest catalog describing all improvements and telling "How to Grow Big Crops," Mailed free.
Remember that the only original and genuine Kemp Manure Spreader is made by us.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LX. No. 2696. NEW YORK, SEPTEMBER 28, 1901. $1 PER YEAR.

THE HEN AS A MANUFACTURER.

WHY SHE BEATS OTHER ANIMALS.

Making Bones Fit Her Teeth.

The hen is a small body—a few pounds of fuss framed in feathers. We consider her as an individual, and conclude that the henhouse is only a side show hardly worthy a place in the solid exhibits of agriculture. That is where many of us make a great mistake. Five years ago the American hen and her yearly product represented a value of $290,000,000. The agricultural statistics for the last census have not yet been verified, but it is safe to say that the year's value of poultry and eggs for 1900 was $350,000,000! The yearly value of the crop that passes through the hen's crop will run a close race with the total wheat crop, and probably exceed every other plant-grown farm crop except corn, hay and apples. This vast total value is only one side of the matter. All living things from a tree to a tree toad are manufacturers, which take crude or organized forms of matter, and make them over into new forms more or less suitable to man's use. It is the plant or animal that gives the widest margin of profit between what it consumes and what it produces that pays best on the farm. Some farmers have persisted in raising wheat or fattening cattle until they finally manufactured a mortgage. The trouble was that wheat and steer gave no margin, since their food cost more than it could bring as grain or meat. Other farmers learned that by growing cow peas, clover and Alfalfa they could cheapen the cost of feeding the wheat and the steer, and thus have the mortgage on Neighbor Brown's farm instead of on their own. Some crops may be easily adapted to such a change of feeding, and in times of depression will utilize what were formerly classed as wastes. The hen crop is one of the best examples of this class. Take a bushel of wheat; with a hen at fair range the 60 pounds of wheat will provide a fair grain ration for at least 300 days. The hen might use more grain to advantage, but we know from experience that 3½ ounces of wheat per day will keep the machine busy. The number of eggs obtained from the wheat will, of course, be determined largely by the breed and character of the hen, but even with a record of 75 eggs for the 300 days the hen will give better returns than any other farm animal. Feed the bushel of wheat to a cow, and get the value of the milk and butter resulting from it, or to a hog, and see how much pork he makes! In nine cases out of 10 you will find that the hen has paid a better price for the wheat than any of her competitors—including the miller. One reason for this is the fact that the egg is largely composed of water and lime—two substances which cost little or nothing. When man puts sand in his sugar, sawdust in his coffee and plaster in his flour we fine him if we can catch him at it! When the cow imitates the milkman and puts more water than the law allows into her milk we beef her, and deny her the hope of posterity. We find no fault with the hen when she packs the water inside her shell. In fact, it is as a packer that she excels, for she can put more culls into her basket and nave them turn out good fruit than any other worker on the farm. She will take a bug, a worm, a blade of grass, a weed seed, a piece of bone and a few kernels of grain, and within 36 hours make them into an egg—its shell enclosing not only that which will nourish and sustain human life, but also the promised life of another hen. There can be no doubt that the hen not only contributes a vast sum to our National wealth, but that she can turn cheap and easily-obtained wastes rapidly into human food. In this respect she stands at the head of all domestic animals—rivaling even the bee in such economy.

UNCLE SAM PICKS A BONE WITH THE AMERICAN HEN. FIG. 292.

Why dwell upon this thought? Because modern agriculture is based upon the profitable use of wastes. For 30 years or more the virgin prairie or woodland glories in its strength, and scorns the gift of plant food. Man moves his barn rather than move the manure pile, throws wood ashes or cotton seed into the river, and drains the barnyard into the creek. In half a century he will squander the bank account which a dozen centuries slowly piled up in his soil. He begins at last to use manure when Nature knocks on the bottom of the barrel, and ends by scouring the earth for waste materials. These wastes are usually food or fuel for man or beast, which Nature has locked up into insoluble forms, as though wishing to hold them until man could realize their need and devise some scheme for unlocking the food. As an illustration let us take bones. In the tough, hard animal frame Nature locked phosphoric acid, lime and nitrogen, but turned the key so that the teeth of man or plant could barely scrape the outside. For many years men burned the bones into ash which would feed their crops. This was wasting a waste, for the fire drove away the nitrogen and made the phosphoric acid nearly insoluble. Finally Liebig discovered the plan of dissolving the bones in sulphuric acid. When this was done the phosphates became available for feeding plants. With a ton of large bones buried in a single acre the wheat might languish and make barely a bushel of grain. When these same bones were cut with the acid and spread over five acres the wheat filled the granary, because the chemist had learned how to make that waste product into available food for plants.

We speak of the bones and the wheat because the American manufacturer has done much the same thing for the hen. The modern green bone cutter is changing the whole aspect of hen feeding, just as the making of superphosphates gave the older farming sections a chance to compete with the virgin soils of the West. The pictures on this page show the point clearly. For many years hen-keepers have known the value of bones as food for poultry. The strongest and most concentrated portion of the animal, of course they were useful in the production of an egg. What could be better for a hen's food, provided you can make it fit a hen's teeth? People baked them, pounded them in mortars, or with ax and hammer on a log, and ground the dry bones in mills. These methods were never fully satisfactory. The hen looked wistfully at the pile of big bones, and charged the farmer a higher price for her eggs than she wanted to until Uncle Sam took out his knife and began to chop little slices off the bone. The bone cutter does not attempt to grind or crush the bone—it slices or gouges, making pieces that create no dentist's bill for the hen. This machine does for the hen what sulphuric acid does for the wheat, and gives the hen man a chance to cheapen his hen ration and, as one man puts it, "feed bugs and worms in Winter!" Many a farm animal that would, in former years, have been hauled off to the swamp for the dogs to fight over is now cut up into food for hens and hogs. In some places the introduction of bone cutters has created a new value for bones—making such a demand that it is impossible to buy a supply at a fair price. We recognize fully the great value of cut bone as poultry food. Nothing could be better to balance a ration consisting largely of corn. A farmer should, however, use good judgment about it. We would not advise every farmer to buy a wood-burning stove, though we use one ourselves, and find it very economical. In many localities wood is scarce

and coal is cheaper. In some places there is not an adequate supply of fresh bones. The hen man should be sure of his supply, but he may rest assured that where he can get them the bone cutter will give him cheap hen food—provided he is willing to turn the crank, and that is no small job.

"THE BACK FIELDS OF CONNECTICUT."

Further Explanation of the Situation.

Since the article by Samuel Marvin was printed on page 515, we have had much inquiry about farm lands in New England. In view of the great interest manifested in the matter we asked Mr. Marvin to continue the discussion, which he does in the following article:

I have had quite a number of letters from persons in the West and South, and many from the New England States. These communications were from professional men, mechanics, farm managers, and parties owning farms themselves, all eager to change their homes and business for farm life here. I would not discourage any one of them in his desire to settle in this part of New England, and would gladly give all the information that I can, but I am not a real estate agent, neither have I the time to find out the particulars concerning farms quite a distance from here, as most of them are, which most of those writing to me wish me to do. By enclosing a stamp to the Hon. T. S. Gold, West Cornwall, former secretary of the Connecticut State Board of Agriculture, you will by request receive a printed list of farms for sale in this county, with price, and any information that can be obtained from that source is perfectly reliable.

The question that comes to me first is: Can a man unaccustomed to farm life come here and make a success of it? An acquaintance of mine residing in one of our nearest cities, seeing the article on page 515, recognized at once by the description the place where he was born. The 200-acre farm for $600, 30 years ago was sold by his father for $7,000 cash. This man thinks that prices of farm land have reached their lowest mark, and that higher wages are paid now to the wage earner than will be in the future, and he advises all who can to save a little from their earnings to invest it in these productive hill farms. For a man who has had little experience in carrying on a farm I should think it doubtful whether he would succeed. To be deprived of the advantages of living in or near a city, if one has been accustomed to it, would be a great drawback; besides, a living here must be worked out by hard untiring labor. What would a school teacher or a mechanic do here, for instance, in trying to break up some of these rough, rocky fields, with a lively team and 125-pound plow? In less than two hours he would wish that the farm and himself were in the bottom of the sea, and that the writer of the article that lured him to the place was along with them. But with a man having a general knowledge of farm life, who is naturally industrious and thrifty, I think success is sure. The foreign element has been very successful here, some owning what were once considered as very desirable farms, owned and occupied by the first "men of the town, who long since have passed to the "green fields beyond the swelling flood." I have in mind one man who lives in a neighboring town who came to this country about 40 years ago, with 50 cents in his pocket and all his worldly goods tied up in a red handkerchief, besides a wife and small children. By industry and economy after a few years he was able to make a small payment on a farm that he wanted to call his home, in one of the most desolate and rocky parts of this county. He told me that in some of his fields he had plowed and cultivated the rocks were so thick that he had to hold up his goats by their tails so they could get their noses between the rocks to find a bite of grass! He now owns a large farm, with 40 cows; good teams and tools. I think it would be a welcome day for some of these old residents to have their old forsaken farms brought back to life again; to see on a dark stormy night a light in the window of these now silent homes, where desolation and decay have commenced their destructive work. It would bring back to their memory the days long gone by, when the axes of a hundred woodmen could be heard on these hills, as thousands of cords of wood were prepared for charcoal to melt the iron ore with which these hills abound. I think success depends more on the man than the farm. The farms are surely here productive, rough and rocky; fences generally poor, and bushes galore, and a comfortable living can only be secured by hard work and patience in well doing. If professional men or those who work at a trade are desirous of owning a farm in this locality why not rent at first, with the privilege of a purchase, or find a small farm within easy driving distance of some good market, and become proficient in poultry raising, or the growing of small fruits and vegetables? I think the most to be solved is how to reclaim the pastures that are so overgrown with bushes and weeds. I am sure that sheep husbandry is the only thing to resort to, or a man might buy one of these cheap farms, keep a milk or butter dairy, large enough to meet his everyday expenses, and stock his farm with all the sheep he could safely carry. He certainly would be on the road to success. There are no sweeter pastures than Litchfield County affords, no water will better quench the thirst of man or beast than the springs that boil up from the heart of these hills, and many never fail during our severest droughts. The "head of the sheep is as gold to the land," and if throughout all New England the hill pastures were stocked with sheep we would not have to send West for our mutton, our Spring lamb, and for wool for our looms, and now where the sweet fern, the hardhack, the alder and briar are fast taking possession, the clovers and fescues would occupy the ground now going back to woodland.

It is possible in the future that the electric system of travel may be so perfected that trolley cars may wind around among these hills and valleys, which will bring the markets to our very doors. Then can we send our milk, butter and cream, our beef and mutton, our vegetables and fruit, to the city markets to compete with the farms that are near them, but which are taxed heavily for a higher valuation. I believe that the cultivation of the apple would be profitable. Fruit of all kinds grows in perfection here; we have no canker worm to eat the leaves of the apple tree, no curculio to sting the beautiful plums; no Currant worm to strip the bushes of their foliage. The iron in our soil gives a high color to the peach, a rosy cheek and a tough skin to the apple, which makes it a good shipper, and large size and sweetness to the strawberry, blackberry and other small fruits. These hillsides that slope to the west, protected from the chill and blast of the east wind, are

THE SULTAN OR OCCIDENT PLUM. Fig. 293.
See Ruralisms, Page 662.

an ideal place for the apple orchard, and with the present demand for export of choice fruit I do not see why in the future the much-neglected apple would not be a source of profit. Will these hardy tillers of the soil ever see this millenium day, when the trolley shall pass their doors, and place them on a footing with those who live in easy distance of good markets? Then indeed can they work on with new energy and vigor. The pastures will look far more green and beautiful than they do now; the crops of Summer and Fall will be gathered with a promise of better returns for their labor. The Autumn tints that make these hills so beautiful when the frost has painted the leaves in their dying colors, will shine out more beautiful than ever, and when the icy blasts of Winter bring the covering of snow on these neglected farms, with stock safely housed, and an abundant supply of this world's goods we can gather around our firesides with more thankful hearts than ever, while peace and plenty are written above our doors.

S. MARVIN.

FRUIT GROWER VS. BEE KEEPER.

The following gives the substance of a correspondence with Prof. Frank Benton, of Washington. There has been some discussion as to whether bees should be fed at the hive when their natural food is scarce:

What should be a fair statement of the proper relations between fruit growers and bee keepers?

Why, so far as I can see, that, taken all in all, each is helpful to the other; therefore their relations should be cordial, and in those cases (exceptional, I think) in which their individual interests do clash, great forbearance should be exercised.

Would it not be fair to compel the bee keeper to feed his bees at home in seasons when they would otherwise prove a nuisance to his neighbors?

Yes, if that, without a burdensome tax upon the bee keeper, would remedy the trouble. I am not at all *sure* that feeding would keep the bees at home. It would doubtless keep some at work in the hives, but probably others would go out in search of the supposed field of stores which was yielding the daily gains. When food is first given to hungry bees (or to bees that are not gathering from the fields) no matter how much they have in their combs, they are at once incited to great activity, fly out and search about. Gradually, finding nothing outside, they fly less, but still fly more than those not fed.

Would it be possible to keep bees at home by feeding them heavily?

It is possible—I am not sure—that feeding to satiety would keep bees from trying the slow process of getting honey (sugar) from the juices of fruits. But what about the cost? Take a case of 100 colonies in this section of the country. They get very little for two months in Summer—not enough to live on and keep up a little brood-rearing. They must have stores gathered before July or be fed. Now suppose, to keep them at home during this period, I fed even two pounds per colony daily. I do not believe this would suffice. The cost would be, for 60 days (really the dearth of honey-producing flowers lasts until September 10) $360—not counting time of feeding. (Sugar, two pounds at six cents, 12 cents; water, two pounds, makes feed cost three cents per pound.) This is over half the return in honey—gross return under favorable circumstances. Would it be just to make the bee keeper pay this, when very likely the cracked and rotting fruit which the bees would take from the neighbor's orchard has been produced, at least has set, because of the labors in pollination of these same bees? Not only that, but also much of the crop of good fruit which the grower was able to gather was due to the bees.

What about moving away?

The cost of moving the bees would be less than to feed them. But where should one go? Can he get away from the fruit grower? If the professional fruit grower can complain and collect damages for the fruit on his 1,000 trees the owner of one tree, and 1,000 owners of trees within two or three miles of the apiary, might collect. See where it ends: The bee keeper, with his useful insects, is driven out—finds no resting place, but is a tramp whom no one wants. "Move on," is the word! Or, what would result? He must quit the business. Now, if, fortunately, some abundant bee pasturage happens to exist a few miles away the solution is easy. But oftentimes this is of short duration; then would come another move, and so on. Or it is hundreds of miles away and uncertain. Cost to bee keeper is not in proportion to return.

Does the bee really prefer fruit juices?

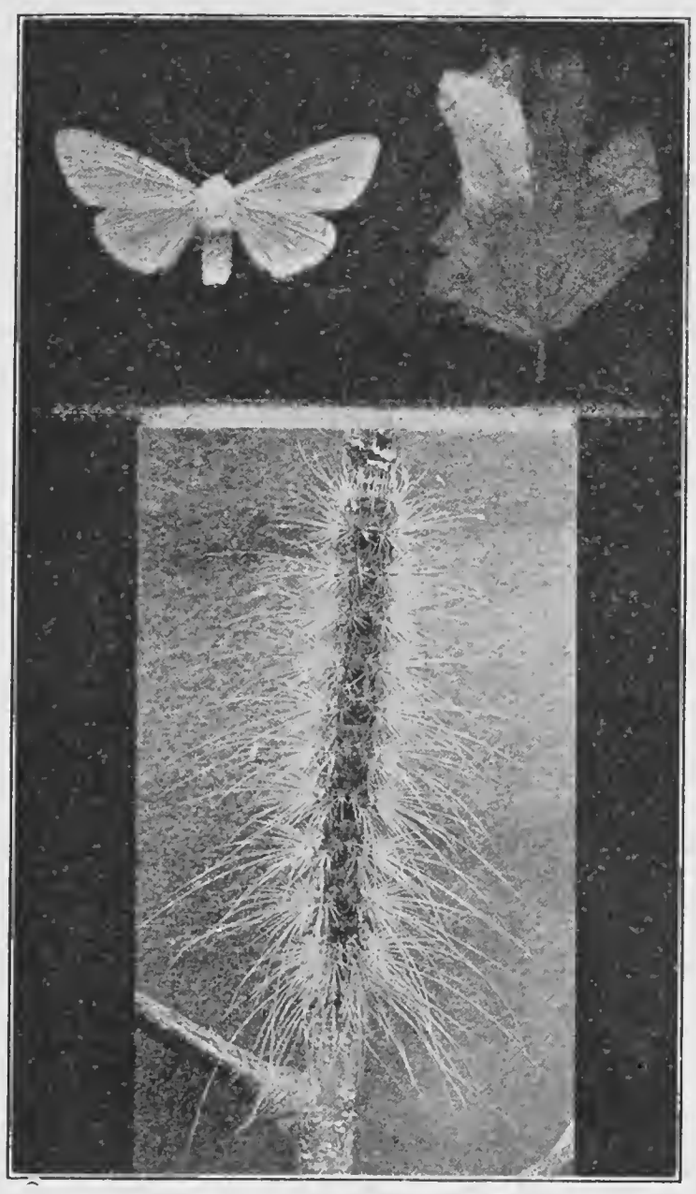
When the bee finds a fair supply of nectar in the flowers within reach of the apiary it prefers that to fruit, and few bees then attack fruit. But I am not at all sure that even liberal out-door feeding near the apiary would keep all of the bees, or nearly all of them, from trying to get fruit juices. I am, however, certain that moderate feeding during honey dearths in Summer pays the bee keeper who knows how to do it without too great expense.

Is this practice general?

In this view a very large number disagree. Few practice it. But I am convinced that the bee keeping of the future will have it as one of the prime features of good management whenever moving to pasturage or creating artificial pasturage (sowing and planting economic plants that also yield honey).

THE FALL WEB-WORM.

Many shade, forest and fruit trees are now festooned with the unsightly silken webs of an insect known as the Fall web-worm (Hyphantria cunea). One of these festooned trees, found on Cornell's Campus, is shown in Fig. 296. These nests remind one of those made by the Apple tent-caterpillar in June, but the latter insect uses its tent only as a retreat or home when not feeding on other parts of the tree, while a family of Fall web-worms extend their nest over their whole feeding grounds, thus making it serve the purpose of shelter and enclosed ranch at the same time. Thus the tent-caterpillar feeds outside its tent, while the Fall web form works inside its web, and does not go out on foraging expeditions. One of these Fall webs and its inhabitants is well shown in Fig. 295. The web worms are quite hairy, as shown in Fig. 294, but are only about half as large as a tent-caterpillar. The web-worms hatch in August from a white mass of 400 to 500 eggs laid on the leaves by dainty little white moths; a moth and an egg-mass are shown, natural size, in the upper part of Fig. 294. Soon the webs will be deserted by their wriggling, hairy builders and inhabitants, which go into the trunks of the trees or to neighboring rubbish on the ground, where they spin cocoons in which they pass the Winter. There is only this Fall crop of webs in the North, but two broods occur in a year south of New York City. The insect is a native



FALL WEB-WORM, MOTH AND EGG. Fig. 294.

American species, and is one of the most general feeders among the caterpillars, as it has been found feeding on 120 different kinds of shade, ornamental, forest and fruit trees over a wide area of our country.

Fall web-worms can be combated either by wiping or burning or cutting out the nests, one of which is usually practicable, but sometimes one does not wish to mutilate a plant by cutting or burning; then the second method of poisoning the worms may be practiced. Remember that the worms keep extending their web over new feeding grounds and, if the surrounding foliage be thoroughly poisoned, the caterpillars will sooner or later get a dose of poison in their daily menu. M. V. SLINGERLAND.

FARMING IN SOUTHWESTERN NEW JERSEY

Fertilizers to Start Stock Farming.

PART I.

At Washington's Crossing, a railroad station on the Delaware River about 10 miles above Trenton, N. J., stands a monument marking the place where Washington's army crossed the icy river on its way to surprise the Hessian soldiers. Across the cold water and up the steep bank came the ragged little forlorn hope. Desperate men, they cleared the river, shouldered their muskets, and trudged off to the south through the darkness and storm to surprise the Hessians. Every school boy knows what they did, and how that hard and desperate march changed history and put new heart into every lover of liberty. The special point of importance with us just now is the fact that Washington's army marched through a farming section. The land was well cleared, farmhouses stood along the road; in fact, it had been even then for years producing its full share of grain and meat. Today, 125 years after Washington's march, this is still an agricultural section, producing meat and grain in large quantities. In spite of more than a century of continued cropping here are farms which produce larger crops than ever. Strange, too, is the fact that here and there one finds a farm which for one reason or another has been permitted to run down, so that it is no longer profitable, and has been restored by chemical fertilizers. That is an old story to many farmers, but this is a new version of it. These farms are naturally adapted to the raising of live stock. They have little potato land, such as we find in Middlesex Co., N. J. They are stock farms, but so poor that they could not at first carry stock enough to pay expenses. By the judicious use of fertilizers on the proper crops the producing capacity of the soil has been so increased that the farms carry twice as much stock as formerly, and show a constant improvement. This use of fertilizers to start the farm into profitable live-stock keeping will seem like a strange thing to many farmers, yet it is a perfectly rational method when we come to consider it carefully. I went to Mercer Co., N. J., to see a farm owned by Ira J. Blackwell, on which this system is being worked out.

The home farm of Mr. Blackwell is close by the famous crossing. Some of Washington's soldiers doubtless marched through the orchard on their way south. Mr. Blackwell's father moved on the place in 1844, and his descendants have lived there ever since. Naturally a farm held for so long in one family has witnessed some surprising changes of agriculture. Shortly after the Civil War, when prices for all kinds of farm produce were high, these Jersey farms were very profitable. That was before the days of western competition, and grain, meat and fruit found ready sale in Philadelphia. Mr. Blackwell gave me some figures of old-time sales that will take the breath out of a modern fruit grower. In 1869 he had an acre of Smith Cider apple trees which netted $1,000, and in 1870 the same trees netted $800. In those years apples were "out of sight," windfalls bringing $4 per barrel, and hand-picked fruit $1.75 per bushel at the railroad station. In 1878 12 acres or 600 trees of Smith Cider netted $2,000, with apples then worth $3 per barrel in Philadelphia. No wonder that with this record Mr. Blackwell says there are few apples that pay better than Smith Cider. In speaking of that $1,000 acre crop Mr. Blackwell says that the hog was largely responsible for it. A drove of hogs ran in the orchard, rooting up the sod and eating the cull fruit. The hogs still run in the orchard, and good crops are still grown, but the combination of big crop and high price is now seldom known—even with the favorite Smith Cider. There have also been some very profitable seasons with pears. The Bartlett seems to lead all others in profit for this section, though the vast quantities sent from California hurt the sale of home-grown fruit. Mr. Blackwell says that New Jersey is a better State for fruit than for grain, yet all through this section most of the farms are devoted to hay and grain, which are fed to stock. The rotation followed on this home farm is probably typical of the neighborhood. The crops are, corn, followed by oats or barley; then wheat and grass for two years, with corn again after the grass.

Most of the farm manure is put on the corn, and

A FALL WEB-WORM COLONY. Fig. 295.

fertilizers are usually put in the wheat and often on the grass. The wheat is sold or traded for bran and other feed. The straw, hay, stalks and corn are fed to stock. This is naturally a good dairy section, but the Blackwells do not keep many cows—preferring stock that can largely take care of itself. Beef cattle, they think, would under their system of farming pay about as well as dairy cows. Ten to 12 Berkshire sows are kept, and all the pigs they can raise are fed for pork. These pigs run in a large orchard, and are well fed on grain, so that they average 200 pounds at seven months. The feed is wheat bran, middlings and whole corn while nursing. When the pigs are about four months old linseed oil meal is fed; a flock of 100 Southdown sheep is kept. The lambs come either very early or rather late—the latter being kept for sale in the Winter. With all this stock to consume the hay and grain, and fertilizers in addition for the wheat, it is quite easy to keep up the strength of the farm, and sell tons of pork and mutton and large quantities of fruit. It is all the easier because the farm has been for years in the hands of good farmers, who have taken good care of it. Mr. Blackwell has another farm which was to begin with "so poor that crows would fly over it without lighting." How can such a farm be saved and put into a thorough and systematic rotation? I will try to tell next week how it is being done. H. W. C.

FIXING THE WALKING PLOW FOR BUSINESS

There are many plows used year after year that are not properly adjusted. Many farmers declare their plows are good for nothing, and blame the manufacturer for their troubles in trying to do a good job of plowing. However, these plow troubles can be very largely obviated, if a few sensible rules or directions for operating are closely observed. In purchasing a plow, select one that is adapted to your soil. The local dealer seldom looks after this matter, unless he is a farmer, and knows what the farmer needs in this line. The dealer or agent usually sells the plows that bring the highest commission, or one that the average farmer will buy because it is cheaper than other plows. The dealer looks out for himself, and the farmer should do likewise. The leading plow manufacturers make all sorts of plows for all kinds of soil. It is a good plan for the farmer to write each of the plow manufacturers who advertise in THE R. N.-Y. for complete illustrated catalogues. From the illustrations and accompanying descriptions it is a comparatively easy matter to select a plow properly adapted to your own soil. The style and size of bottom, size and curvature of moldboard, and width and depth of cut must be considered.

Many farmers select a so-called two or three-horse "general-purpose" plow. This has been my plan when purchasing a walking plow. Then one can use two horses in plowing oat or wheat stubble, or when necessary in heavy soil, going slow or stopping often. When using three horses, one can keep the plow moving constantly all day long. Do not try to make a plow cut wider or narrower than it will naturally run when properly set up and adjusted. No plow will work well otherwise. When set up, the general-purpose plow is naturally adapted to two horses, with the evener center hitching clevis at the end of the plow beam. If three horses are attached, walking abreast, the center clevis must be moved toward the left or land side a certain amount, until the center line of draft balances the plow when cutting the full width. I prefer the steel beam for a general-purpose walking plow, as there is no need of changing or swinging the beam and wheel, no matter whether two or three horses are attached. Such steel beams should have a combination clevis that will allow necessary vertical and horizontal adjustment to make the plow balance and run in its natural channel.

The small wheel under the beam should always be set to run exactly parallel with the land side of the plow. The hitch should be just high enough on the clevis to allow the wheel to run lightly and steadily on the ground. There should be just enough pitch to the plow point and share constantly to hold the plow down to its natural capacity, and no more. More pitch can be given to a plow, when necessary, in very dry, hard soil, by putting a thin wedge in between the top of the plow standard and beam, but it is seldom advisable, as it makes the plow run harder, and with a greater tendency to wear off the point and share. I have seen plowmen in the furrows, walking in a braced attitude, so as to push the plow handles to the right or left, to prevent their plows from tipping over, and keeping up this unnecessary "exercise," as a sort of "side issue," all day long. There is no need of this, as, with a proper adjustment of the beam, evener and clevis hitch, with lines correctly arranged, any standard walking plow, if not worn out, will work nicely and balance to suit the most exacting requirements of soil or locality.

I have properly adjusted more than a dozen walking plows that were bothering farmers whom I met in traveling in various portions of the country. It usually took but a few minutes to make each plow run properly. In several instances the three-horse evener was too long, and the horses spread out too much. The three-horse evener, including singletrees, should be of just the right length, so that the draft clevis of each horse will be exactly behind, and on a line running midway between each pair of hind legs. Any deviation will cause more or less side draft. The majority of two and three-horse eveners are too long for use on a walking plow. In the next article I will illustrate these various adjustments.

WEB-WORMS IN FOREST TREES. Fig. 296.

Farmers' Club.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

The Lawver Apple.

G. W. G., Columbus, O.—In your issue of August 17 there was an item stating that the Lawver apple and the Delaware Red Winter were the same, and that the former was a shy bearer. I at once wrote to the persons who sold me 1,000 Delaware Red Winter trees and enclosed the clipping from your paper. I asked them whether they could furnish scions of the Stayman to top-graft my young trees as I did not want the Lawver. Their reply was that the Lawver originated in Missouri. The Delaware Red was originated at Milford, Del., by W. P. Corsa, now of the Department of Agriculture, Washington, D. C. I think this ought to be investigated, as it will make people who have purchased the Delaware Red Winter anxious, and they may not wait to inquire as I have, and at once top-graft the trees with something else.

ANS.—The confusion which has arisen regarding the Lawver-Delaware Red Winter matter has been thoroughly investigated long ago, and there is but one variety going under these names, and it is the Lawver, which originated in Missouri. There were a few trees of it found in the suburbs of New York City, and for a time it was thought to be distinct and new, but after it had been so renamed and distributed by Mr. Corsa, of Delaware, it was found to be only the Lawver. Unfortunately this apple does not bear well anywhere, so far as I have heard. It is a beautiful red apple that is of fair quality and keeps very late, and if the tree bore well it would be desirable. Stayman would probably be a very good variety to use in top-grafting the Lawver trees, as it will do well in central Ohio. H. E. V. D.

Diseased Trees; Dwarf Pears.

J. M. K., Oakland, Kan.—1. I have some apple trees, about eight years old; the bodies on the south side of the trees and part way up the south side of the trees and part way up the south limbs are dead. The bark has peeled off and the wood is dry and hard as flint. What is the cause and remedy? My pear trees are in the same fix, and yet both apple and pear are loaded on the north side with fine fruit. 2. I lost about 100 cherry trees (yearlings set this Spring). The body of the trees all round, from the ground to eight or 10 inches up the tree, turned black, bark shriveled and adhered tight to the wood. The tops lingered a while and dried up. What is the cause? The roots and body below ground are green. If they should sprout out again below the dead line, would you advise leaving them stand? 3. What dwarf pears would you advise planting for near-by market, and how would you set them in orchard? Is the Lincoln pear better than the Kieffer? Would you set dwarf pears in every alternate row, or every alternate tree in each row, and what distance apart each way?

ANS.—1. The apple trees mentioned are very probably affected by what is commonly called sunscald, which is a trouble that is not clearly understood by either scientific investigators or practical fruit growers. It is generally thought to be from the violent changes from warm to cold weather and the reverse, especially in Winter. It may be from some germ that finds its way into the vital parts of the trunk. There are cases where it is quite surely the effects of Pear blight, as that disease works in both apple and pear trees. But the fact that only the south side of the tree trunks is usually affected points to the former cause as the one most largely to blame; for the sunshine acts directly there. Wrapping the trees or tacking a board on the south side is sometimes a good preventive. 2. The cherry trees may have been damaged when they were bought, or the hot Summer may have hurt them. It has been very hot and dry in Kansas this past season, and such injury is not uncommon there, as I know by plenty of sad experience. These damaged trees are worthless. If they should sprout above the places where they were budded they would be very weak, and if below they would be of some worthless variety, probably the Mahaleb stock. 3. Angoulême is about the best pear to use in setting dwarf trees, Louise Bonne also does very fairly, and so does Bartlett when it does not blight. They should be set about 12 feet apart each way. If part standard trees were set it would be well to alternate the trees in each row at this distance, arranging them so that when the dwarfs were gone the standards would be 24 feet apart. H. E. V. D.

Disappointing Peach Trees.

C. W. P., Guilford Center, Vt.—I have a peach orchard consisting of 100 trees; Oldmixon, Early Rivers, Crosby, Waterloo, Early York and Mountain Rose. These trees are six years old, very thrifty, with heavy tops, and stand about 11 feet apart each way. This orchard has never borne more than one bushel of fruit in a season. The ground has been kept clean from weeds, and hard wood ashes used around each tree. The outside trees do not bear, which does away with the possibility of the trees being too near together. Is it possible that the orchard is worthless? If not, how can they be treated so as to be profitable?

ANS.—In my opinion, which must be formed without having seen the orchard and with only a general knowledge of its climatic and other conditions, the fundamental trouble is that Vermont is not a peach growing State. There may be sections within its limits where peaches may be grown with some degree of success, but they are certainly very limited. The varieties are not more tender than most others, and the blame cannot be laid to an unwise selection. The distance apart is too close for ordinary peach culture, but as the trees are said to be thrifty, and perhaps healthy, they are not being starved into unproductiveness. It is probable that the fruit buds are killed or seriously injured by the severity of the Winters, and this may be the principal immediate cause of the failure to bear fruit. If the trees bloom and set fruit abundantly then it is likely that it falls from some adverse condition of the climate. In my travels through New Hampshire I have rarely seen a peach tree, and it is not to be wondered at that those that are set do not prove profitable. If they did well there would be more of them.

H. E. V. D.

Crows and their Food.

Reader, New Jersey.—We have observed a good deal of damage from wireworms. In some cases, especially in the damper soils, we find large quantities of these worms at work. They eat into the face of the potato, generally beginning at one end, not spreading all over the surface, but apparently chewing away as though they meant to make a clean job of the whole thing. One day we were digging, but were unable to pick up the entire day's work, so that a number of bushels were left on the surface of the ground. This was on a back field over by the woods. The next morning, when the boys went there to pick up the potatoes, they found a big flock of crows at work, and the boys insist that every one of those potatoes had been turned over by the crows, who did not attempt to eat the tubers. Small stones were also turned over, and we conclude that these crows were after the worms. The other morning we got up early and went up to look at the cabbage field. There was a flock of 50 to 75 crows perched on the fence, with some of them down in the cabbage field. They had evidently been at work there ever since sunrise, but we were able to find but one cabbage that had been eaten at all. We concluded that they were after the Cabbage worms, and after watching them for a while, we are sure that they disposed of a good many of them.

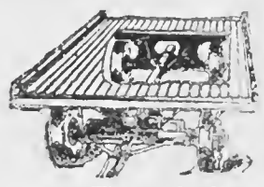
ANS.—A few years ago the United States Department of Agriculture published an extensive report on the crow, and from this report I glean the following deductions regarding the insect food of this much-abused bird. The insect food of crows is almost exclusively composed of terrestrial species, that is, such as are found on the surface of the ground, or hide during the day at the base of plants or under the various objects lying on the surface (thus it would not be strange if the crows did turn over the potatoes left in the field); or such as live in the dung of domestic animals, in decaying vegetable and animal matter, or underground. There is not the slightest indication that crows catch any insects while on the wing, and the indications are that the birds when sitting or resting on trees or shrubs do not pick up insects. The indications are that crows preferably frequent dry pasture lands, dry meadows, or very open woods, where cattle or horses are grazing; they may also frequent the margins of ponds or streams, and the presence of white grubs and wireworms in their stomachs show that they have followed the plow of the farmer.

The crow's insect food consists only of large or medium-sized insects, with the exception of ants, which are frequently found in their stomachs. Crows appear to prefer insects with a hard covering, like the beetles, to the more soft-bodied ones, like caterpillars. A marked exception to this rule is the frequent occurrence of spiders in the stomach. It would seem that crows have a predilection for insects possessing a pungent or otherwise strong taste or odor, and as a peculiarity of very little importance, is the fact that insects of a bright, and more especially golden, color are apparently very attractive to crows and are eagerly picked up by them. Several hundred different kinds of insects have been found in the stomachs of crows. These may be placed in the following general groups: Grasshoppers, dung beetles, ground beetles, May beetles (but few larvæ or white grubs occurred in the stomachs, however), ground spiders, weevils, cutworms (but not so many as one might expect), soldier or stink bugs, ants, click beetles (their larvæ or wireworms were found in only a few stomachs), a few bees and wasps, and a few flies and crickets. The absence of the useful ladybird beetles and of the leaf-feeding beetles, including the notorious Colorado Potato beetle, was a striking characteristic of the insect fauna of the crows' stomachs examined. Some observers report that crows feed on the Potato beetle, but others state that they could not tempt their appetites with this pest. Very few of the immense host of parasitic enemies of insect pests were found in the stomachs. The absence of all Cabbage worms, excepting a solitary specimen, deserves mention, says the expert who examined the stomachs. Summarizing the writer states that among the principal insect food of the crow there are only two classes of eminently beneficial insects, namely, the ground beetles and the soldier bugs. All the rest belong to the injurious insects. The facts on the whole overwhelmingly speak in favor of the crow, and taken alone would be at variance with the prevalent opinion hitherto held and yet held regarding the economic status of the crow as an insectivorous bird. Over 26 per cent of the crow's food for the year is made up of insects; in January only about three per cent of its food consists of insects, while in April, May and June it averages nearly 50 per cent. Thus the evidence seems to be against the probability of the crows having had many Cabbage worms for breakfast that morning. M. V. SLINGERLAND.

I THINK Prof. Van Deman would better adopt Pinafore's "hardly ever" in regard to borers in plums, for one of my seven plum trees was killed by borers.

Ohio. E. S. I.

Haul Your Cornstalks



on our Low-Down, Broad-Tire, Wide-Platform, **Handy Wagon,** with wheels that turn under the load. It is easy draft, easy to load, never breaks down or upsets. Best, handiest, strongest wagon for all farm purposes. The only low-down wagon *adopted by U. S. Government* for hauling war supplies. We want one live farmer as our agent in every county. Write for terms and descriptive circulars, free.

FARMERS' HANDY WAGON CO., Saginaw, Mich

AN ICE HOUSE WITH CELLAR.

I have used an ice house with cellar such as A. B. W., Newlin, Pa., wants to build, and fear he is planning for too much expense. Ice is very heavy stuff, and his iron beam would not only need to be a heavy affair, but his flagging stone would need to be at least eight inches thick. My cellar (10 feet inside) is covered with four heavy sleepers planked over, and I found it necessary to put posts under the two middle sleepers. It has been in use 12 or 15 years, and when it becomes necessary to rebuild I shall put in a stone arch. The cellar opens into the basement of another building with two-foot wall and doors at out and inside of wall. The outside of doors should be covered with sheets of zinc lapped over, so that water that condenses will drip off. Inside the air will be as cold as the door, with no condensation, but there will always be water on the outside in warm weather. An ice house 10 feet square, inside, with six-inch studs, boarded inside and out, and the space filled with sawdust, if made so tight at the bottom that there will be no circulation of air up through the ice, and so open at the top as to give good ventilation there, will keep ice all Summer if a mass eight feet high is put in and kept covered with six inches of sawdust. My rafters are two inches thick where they lie on the plate, and the space between roof board and plate is left open, and a triangular space 1½ foot across the base, at the gable. The posts of my house are but seven feet, so I boarded up the under side of the rafters a little way, and fill above the posts. We put a layer of straw about two inches thick over the plank floor, and two or three inches of sawdust on that, changing them about once in three years. The less filling between the ice and cellar the cooler the cellar will be, but, of course, the ice will waste faster. I hardly think A. B. W. would get much benefit from his ice through a foot of sawdust. Milk and cream will keep sweet in such a cellar, but the latter will not ripen properly for churning. Ripened in higher temperature it can be cooled to the proper temperature for churning very nicely. It will not do to put butter in prints in the cellar before marketing, as the customers cannot keep it at so low a temperature, and it gets softer than if it had never been brought so low. My cellar is absolutely dark, and we hang fresh meat and throw in radishes or other vegetables that we want to keep fresh, doing away with a refrigerator entirely. Perhaps I ought not to tell of it, but we roll a barrel of new cider in there late in the Fall and have sweet cider in the Spring. We sometimes put a few apples in the cellar in the Spring to ensure having pie apples the year round, although after strawberries come we don't eat many. If I were building anew, as A. B. W. proposes, I should certainly put another building in connection with my ice house, with basement connecting with the ice house cellar. This basement will be plenty cool for the ordinary keeping of milk and cream, and being light can consequently be made of use in many ways. R. S. H.

Connecticut.

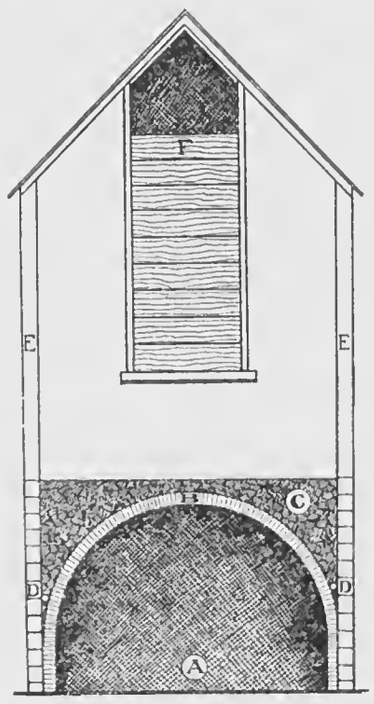
A Serviceable Ice Cellar.

Seeing A. B. W.'s inquiry on page 613 would say we have had a similar ice house in practical use for many years, and it keeps ice with a little care from ice to ice again. I think it superior to his plan, and probably less expensive. It is a double thickness of brick, in shape of arch, laid in cement, the crown being a little over six feet from cellar floor. The whole arch and sides are covered with broken or waste charcoal to about three inches above the crown, so that it will have the benefit of a non-conducting bed, and also it is non-destructible, and if not scraped off will last a lifetime. The sides should have two one-inch pipes inserted at bottom to carry off leakage, and these pipes should be carried into the ground so that they will not create a circulation of air and melt the ice. Of course they could be turned up at bottom so as to hold enough water to keep out air. I give a rough outline of our house, Fig. 297. The house is weather-boarded with cedar weather-boarding inside and out. The only care is to keep the sides and top of ice well incased in sawdust, as ice recedes from the sides. The boards are put in or taken out as required in the window, and the top is *never* closed. There should be a window at each end of building to insure free circulation of air. The secret of keeping ice is perfect drainage at bottom, free circulation of air *over top*, and perfect insulation at sides and bottom. This ice house was built by my father (Jonathan G. Williams) on his farm near Moorestown, Burlington Co., N. J., and has done and is doing good service for many years. In the diagram A is the cellar, B the brick and C the charcoal, D and E the spaces between walls, and F the door.

Philadelphia. C. W.

Doubts About the Plan.

I have had enough experience with ice houses to know that such a cellar as A. B. W. describes for the purpose wanted would be very unsatisfactory, and is impracticable. In the first place, an ice house is built to keep ice, A. B. W.'s



ICE HOUSE WITH CELLAR. Fig. 297.

plan, if feasible, would waste it. Ice cannot cool anything without melting. Again, the house with a cellar allows no chance for drainage without allowing air to get under ice, just where it is not wanted. An ice house must have good drainage. An ice house built on A. B. W.'s plan would be a very unfit place for milk; it would be damp, and would drop water from sweat forming on the stones above. My advice would be to build the house at least 15x15 feet; leave a good air space in the walls; tar paper the inside of outside boarding unless matched lumber is used, and above all allow good drainage, and plenty of ventilation above ice. Such an ice house will furnish ice enough to cool A. B. W.'s milk and cream in a tank in which he can set his cans, or any other good way. F. A. T.

Ridgewood, N. J.

DRY FODDER IN THE SILO.

Several years ago the plan of allowing corn to be shocked in the field and well dried out, then drawing and cutting into the silo, was advocated by the late Hon. Henry Tallcot, of Ohio, and Edgar Huidekoper, of Meadville, Pa., and warmly commended, the chief point of commendation being the saving of field freightage. So far as I know, the practice is not followed now, for the reason that it was found in practice that the great loss in drying the fodder (something over 20 per cent of the entire dry matter being rendered indigestible) overbalanced the saving in freight. Then it was found that there was no loss in food material by the ears being cut into the silage, rather a gain, as the experiment stations showed that the silaged grain had more nutritive substance, and gave a better feeding result than the same grain husked and ground into meal, so that the cost of both husking, grinding, and time were all lost, as against silaging the entire crop. Since then we have heard nothing about the practice of silaging dried corn fodder. Now and then a man places a "grabber" at the side of the cutter table, and grabs off from the stalks a few bushels of corn ears, and cures them out on the grass.

It is feasible to cut dry fodder into the silo, and wet it down so that it will settle, and if well tramped and packed, but little of it will mold, but this will not restore to the fodder the same feeding qualities it possessed in the first succulent state. A plant once dried can never be soaked, steamed, cooked or fermented back into its first feeding value. All that can be done is to make it easier masticated by the animal and more palatable, and the animal coaxed into eating more of it. It is advisable when filling a silo with dry fodder, to choose a time just after a rain, and then put on just as much water as you otherwise would. All the benefit of the rain is in saving wastage of leaves and fine material while drawing. It requires not far from 50 to 60 gallons of water to the ton of dry fodder, so that the water has to be hauled in either case, which means that it would best be drawn in the form of succulent fodder at the start, and save the loss of material in drying, which amounts to about 22 to 26 per cent, while in a good silo with fodder just beginning to glaze its grain, the loss should not be over 10 per cent, and in many silos last year it did not exceed four to six per cent. If fodder is to be wetted down, there is no better plan than to have a tank with hose and rose sprinkler, so fixed that the water is thrown upon the fine fodder as it comes from the knives into the carrier, and made apparently very wet, and in going up the spout and the "throw," together with the forking and tramping, the water gets very evenly distributed through the mass. To get on 50 gallons or so of water to the ton makes it look very much wetter than it should be, but when one considers that in drying corn fodder it loses about 700 pounds of moisture to the ton, the necessity of making it very wet, so to get the heating and ferment, is very apparent. If one will read Henry's Feeds and Feeding he will readily see that cutting, or any method of treating foods once dried, is simply to increase the animal's liking for it, and clean up the manger, the economy being in getting the animal to eat up the coarser parts, but the digestibility of the food has not been increased. In other words, where an animal will eat up a certain dry, coarse food like corn fodder, within 10 per cent, it will not pay to assist in any mechanical way in the feeding, like cutting, steaming, silaging or "fussing." One Winter before our silo was built, we fed the cows whole fodder, ran the rejections through the fodder cutter, piled it in heaps, wet down, and mixed in fine bran and covered with an old canvas, and when the mass became hot, fed it out to the cows for a change ration, and saved cutting about 85 per cent of the fodder, and the remainder was so small in amount, that it mixed in with the other food without perceptible change in the milk product.

Ohio. JOHN GOULD.

A SOUTHERN sportsman gives the following directions for cooking brook trout in camp: "As soon as the fish is landed, dress and put in a little butter, salt and pepper, and a small piece of bacon. Then lay the trout in a corn shuck out of which a roasting ear has been taken, smooth the leaves down and tie at the silk end; bury in the timbers, and cover with live coals. The ear of corn is to be roasted and eaten with the fish."

The New Horticulture

BY H. M. STRINGFELLOW.

We do not hesitate to say that this is one of the most interesting books on horticulture that ever was printed. Most reading farmers have heard of the now famous "Stringfellow Method" of planting trees, but few understand clearly what it is. This book tells the whole story in clear-cut, forcible style, which all can understand. Not only is the theory of close root-pruning carefully explained, but the general principles of gardening and fruit-growing are discussed. Mr. Stringfellow is a practical gardener, and he gives his own experience. We commend the book to all without reserve. New Edition, paper covers, 50 cents.

THE RURAL NEW-YORKER, New York.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

Our Best Cover Crops.—The excessive rains and great heat of August stimulated our cow peas to outdo all former efforts. The Early Black, which usually makes less than two feet of growth, grew until it rolled up a tangled mass waist deep, and has now dropped most of its leaves, while the ripening of the pods goes on. The tubercles on the roots are larger and more numerous than we have ever had them before, particularly on soil where the peas were grown before, showing that the tubercle germs are increasing in numbers. Other varieties, such as the Whippoorwill, New Era, Late Speckled, etc., are making phenomenal growths and blooming freely, but will not ripen seeds. The improvement of the soil by cow peas is so thoroughly established in the South, where they have been long grown, that it is never questioned, and it is only a matter of finding a sufficiently early variety to make them valued in the North. For our own purposes we grow the Early Black on our cultivated land for the purpose of choking out weeds, restoring the soil texture, and providing a Winter cover, without taking into account the value of the nitrogen stored, which all agree to be considerable. We gather a portion of the earliest pods for seed, and allow the chickens to harvest the rest at their leisure, which they do with much skill and persistence, to the evident improvement of the egg record.

While Crimson clover likes plenty of moisture when young, an unduly high temperature is not beneficial, and our stand, though thick and even from good germination, has been quite yellow and flabby. A few cool nights, however, have tinged the plants a deeper green, and started a vigorous growth which should last until the ground freezes. We sow Crimson clover in strips between small fruits and after early vegetables to hold the soil during Winter, and gain all possible fertility. Of its beneficial effects when turned under in the Spring we are fully convinced. The Rural Grounds soil had been long cultivated as a nursery before being put to its present use, and was as devoid of fiber and humus as could well be. To restore it to proper conditions meant heavy applications of stable manures or the growing of grasses. The first was objectionable on account of expense and the certainty of introducing troublesome weeds, and the latter because of the necessary loss of time. Moderate applications of good chemicals and growing nitrogen-gathering legumes was the plan adopted, and so far carried out with much satisfaction. Clover has now been induced to grow by repeated sowings on a bare and worn slope, so poor that weeds would not cover it, even in a wet year, the growth soon dying out in earlier attempts, but becoming stronger as the soil became better inoculated with the tubercle germs. We shall keep right on with the clover on this strip each season, in order to ascertain its restorative powers, when used alone. The most common objection to Crimson clover in this locality is the uncertainty of getting a good stand if the weather should remain dry after planting. The chances of winterkilling are not much considered, as the Fall root growth is reckoned as sufficient to pay for the seeding, even if it freezes out altogether. Cow peas can get along with much less moisture than clover, and rarely fail to germinate, and start off well if good seeds are sown in freshly prepared soil. The benefits of cow peas to the soil are so direct and considerable that one cannot grudge the use of the land for an entire growing season, but the commercial seeds are rather expensive, and too often of poor quality. It costs time and trouble to save one's own seed in the proper manner by hand picking and careful shelling, but it is certain to pay in the end.

The Sultan or Occident Plum.—This is one of Burbank's hybrids sent out three or four years ago. Fig. 293, page 658, shows a typical fruit sent in by J. H. Black, Son & Co., Hightstown, N. J. Many specimens are larger than the one represented, and in California it is said to grow as large as a medium-sized apple. The color is dull red, shaded with greenish yellow and covered with a blue bloom. The flesh is very firm, and dark red in color, like Satsuma. The flavor is sweet and good, only a slight astringency being perceptible under the thin, tough skin. The stem is very short, causing the plums to cling firmly to the branches like Delaware and Apple, also red-fleshed seedlings of Satsuma. The Sultan is a long-keeping plum of a quality high enough to become popular. The tree on the Rural Grounds is a healthy, vigorous grower, but too young to fruit. If Sultan and its companions should bear well and show a reasonable resistance to rot they will be useful here in the East. Burbank named this plum Sultan when sent out, but Prof. F. A. Waugh, in his Plums and Plum Culture, page 221, substitutes Occident for Sultan, as the latter name was given to an English seedling of the Domestica type about 1875. The European Sultan has probably not been introduced in this country.

A Worthy New Basket Plant.—Campanula isophylla Mayii is a new trailing bellflower that seems admirably adapted for the window garden. It has neat small foliage, a slow rambling growth, and is a remarkably profuse bloomer. The flowers are saucer-shaped and of a clear lavender-blue. Hundreds of these attractive blooms open at a time on plants small enough for a five-inch pot, presenting a continuous mass of color. They are about two inches across and last several days. The plant should be grown in a partially-shaded place, and likes well-drained soil and an airy situation. During the late hot and muggy weather our plants under glass lost most of their growth from mildew, but at once started freely when removed to a shaded porch. It is still so scarce that it has not been tried much in an amateur way, but there is little doubt it will make an important addition to the few plants really adapted to cool and half-shaded windows. When grown in pots it can be staked up a foot or more high, but it thrives especially well when allowed to trail over the sides of a deep basket. Campanula isophylla, the species from which this new variety was derived, is a native of Italy, and is often grown on shady rockeries. There is a white form that is very popular, but it is not so free in bloom as C. isophylla Mayii. W. V. F.

IMPROVING QUALITY IN SWEET CORN

The statement was recently made in The R. N.-Y. that the Sheffield sweet corn is improving in quality. As this variety was originated by Dr. Van Fleet his opinion was requested, and is given in the following interview:

In referring to the Sheffield corn a few days since a correspondent stated that this corn has improved in quality from year to year. Is it a fact that most sweet corns are improved in this way?

I think so. A very sharp watch is kept on the table quality, which is indicated to a great extent by the appearance of the cured seed. Corn having a high sugar content in the grain shrinks greatly in drying, and becomes translucent in appearance.

Do I understand then that kernels are picked out, or is the selection done entirely by the picking out of ears?

The seed to be put on the market each succeeding year is improved by selecting ears. For stock seed for improving the strains I have reason to believe that the individual kernels are selected for the necessary characteristics.

What type of ear would be selected in the Sheffield?

The ideal type of Sheffield corn is a medium-sized ear six to seven inches long, well filled to the tip with translucent kernels. It is an eight-rowed variety, and the ears should average nearly two inches in diameter.

Would the selection be made on the stalk or after the corn was dried?

For stock seed purposes the selection would be made in the field among the earliest developing ears. The stalks would be marked, and the ears not coming up to standard rejected on gathering.

The idea is, then, that the ear would naturally convey that early maturing tendency to the crop?

Yes, as Sheffield is an early corn an effort is made to accentuate that characteristic.

In selecting for quality on the average how many of those dried pointed kernels would be found on the ear, that is how close down do you cull?

As it is, of course, impossible to make a culinary test of the corn selected for seed, we must depend entirely on the appearance. In the ear approaching the ideal type about one-third of the kernels occupying the middle portion of the cob would have the desired characteristics. Chance kernels may be found on other ears not having the desired characteristics.

Do you have any idea that these kernels selected for quality would give as large yield as the others?

If a good germination is secured, there could be no doubt that the yield would be fully as good. However, the increased proportion of sugar in the seed rather favors rotting.

Does that explain why some strains of Evergreen are so hard to germinate?

Possibly it does. Nature has undoubtedly fixed a limit beyond which it cannot be induced to go. The proper balance for the nourishment of the germ must be maintained. An excess of sugar content may mean a deficiency of other ingredients, possibly a deficiency of enzyme, a ferment which renders the surplus of sugar and starch available for the assimilation of the germ.

Do most seedsmen make a double selection, one for commercial use and the other for gardening purposes?

I think they generally do so. The theory is that once the selection is made and a crop of seed grown from this selection, it will answer well for commercial growing for that season, but to propagate and intensify the desired characteristics it is necessary to make a still narrower selection.

Do they charge an increased price for these extra kernels?

A higher price would be charged, but as a matter of fact no special stock seeds are allowed to pass from the seedsman and his grower.

Is this plan of selecting these improved kernels practicable for the private gardener?

It is perfectly practicable for anyone who is willing to give the necessary care and attention, but it is very necessary that the grower should have a definite ideal toward which to work.

Is any such selection practiced in other vegetables, the beet for instance?

In the beet the root itself is tested, and seed is raised from those that have most of the desired characteristics. Of course such a test is not practicable in corn, where the seed itself is the edible part.

HOPE FARM NOTES

PAN-AMERICAN.—I am writing these notes on the Exposition grounds. This is a long distance from home for the Hope Farm man. The Madame and the Bud could not come with me, but Aunt Eleanor came along and is now having the greatest play-time of the last 25 years. As I write we are all saddened by the news of the President's death. That seems to throw a shadow over the whole place. Saturday promised to be the greatest day of the Exposition. It was "Railroad Day," and thousands were on the incoming trains cheered by the reports from the President's bedside. As soon as it was known that death was at hand orders were given to close the gates. The fountains stopped playing, the buildings were shut, and the beautiful city stood silent as the grave. One could wander about the great enclosure with barely the sight of a human being save the soldiers and guards. The silence was most depressing on the usually noisy "Midway." All the life and spirit had dropped out of the scene, leaving only a melancholy and depressing silence. How one of those black-hearted anarchists would have enjoyed himself there!

To me the saddest part of it all is the appearance of the old soldiers who are here by the thousand. These gray-haired men who faced the storm 40 years ago, and saved the Union, now seem to be in doubt as to whether other influences have not undermined their work. Is there not a crack or a flaw in our system of government when some worthless wretch, whose life is not worth 10 cents to the community, can and will step up and shoot a man like President McKinley? It has been the boast of our people that our Government is such that any man *can* easily do such things, but our theory has been that no one *will* do it. That is where we have made our mistake. It is that thought which saddens the heart of the old soldiers—and well it may.

WHAT IT MEANS.—We suddenly wake up to find that we have many of the social and political dangers of the old world, without the strong, iron-hand d government which on the other side of the water holds them in check. My fear is that in trying to square matters and prevent the anarchists from repeating their awful work Congress is likely to go too far in preventing free speech and fair discussion. It has been my conviction for some years that Americans have, as a nation, been playing too many tunes on the prosperity and money-making strings of our National harp. The moral, God-loving strings and fiber have become too slack. Human life has been held too cheap. All lynch law, mob rule, crushing out the rights of the poor, the unpopular or the helpless, without giving them a fa r show—all these things have been sowing the seed from which grew this awful tragedy. There is and there has been too much of placing money above true morality. Congress will and should pass strict laws absolutely prohibiting treason or murderous talk. It should also export these cursed murderers—and I suggest the North Pole as a good place to cool them off. That is right, but it will prove, in the end, like painting the face of a consumptive, unless the American people themselves get some of the dollars out of their eyes. We need not only morals in public life, but more of the true God-fearing spirit of old. That is what makes it so hard to understand why a man like President McKinley should be killed in such a cowardly way. The closing of this pure and hopeful life is to my mind one of the saddest pictures in all history. His wife was herself at death's door. She has been ill for years. They have no children, and the husband has given a father's care to the wife. She did not even know how he was hurt. The thought of these sad, home feelings will go far into the hearts and souls of the common home-loving people of America. Our good President will not have died in vain if such people realize the true significance of this awful warning. And what an opportunity the new President has for strong and earnest work!

WONDERFUL FRUIT.—To pass from this dreadful affair to the living and material side of the Exposition, I have been greatly interested in the fruit show. The Horticulture Building is one of the best on the grounds. Fortunately no gallery was built around it, and the exhibits have the benefit of perfect light. As a result there was as large a crowd in this building at all times as one could find anywhere—even in the Art Building. Why should not this be so, since no human hand ever painted such beautiful colors as Nature has painted on these fruits? Nature does love an apple, and she reserves her most delicate brush for its dress. Some specimens of Clairgeau pears from Idaho struck me as the finest specimen of sun painting I ever saw until I got around to the exhibit of apples from Maine. Why, some of those Alexanders were certainly like the man they were named for—great. There were figs and dates from Arizona and California, nuts, grapes, peaches—a bewildering display. Up over the Illinois exhibition was a picture in colors taken from the drawing of Ben Davis and Miss Kieffer Pear printed in THE R. N.-Y. two years ago. They had wisely omitted the verse that went with the picture. The exhibit showed that every corner of this great country is prepared to raise fine fruit and pour it into our eastern markets. What are we going to do at Hope Farm and similar places when the rush comes? Why, plant trees on the hillsides and take good care of them! These exhibitions will educate the people. I notice that they are learning to distinguish varieties already. That is just what we want to build a discriminating market.

AGRICULTURE.—Some of the big Western States had fine displays of farm products, but I doubt whether many eastern farmers can now be induced to "go West," for the States east of the great lakes made a good showing. Our New Jersey exhibit was a good one. Some of our corn had stalks that were perfect sky-scrapers. The ears were so long that a man would be close to a donkey to think he could beat them. I had a talk with some farmers from Illinois. They were astonished at the corn we can grow. They had to admit that they couldn't beat it. When they were told what corn and other farm products will bring in our markets, and how it is impossible for any Jerseyman to get seven miles from a railroad without leaving the State, one of them could only say that the map shows that "Jersey is all corners, anyway!" That's right—it is easy to get a farmer into a corner in New Jersey, and that is just the situation in which he does his best work! That is true of most people.

THE PEOPLE.—There were all sorts and kinds—in fact, the crowd itself was the best exhibit of all. What a mixed-up citizen the American is! I sat and watched the crowd. Here were people from Maine to California, and no one could pick out any single person as the typical American. The bean-fed Yankee and the corn and bacon man from Iowa are getting to be as different in appearance and habits as the Jersey and the Short-horn cattle. To my mind the types are not coming together, but are becoming more distinct. Two things that seem to be acting as advance agents for a sort of universal democracy are the modern shirt waist and the culture of fine apples. The women show more independence and uniformity in dress than they used to, and to-day you cannot tell from her clothes where a woman is from. Too many of the men still stick to the black suit with its long-tailed coat. . . . . I was pleased to see how farmers and their wives are interested in the exhibits of household conveniences and fixtures. They ask many questions about bathroom contrivances, acetylene gas machines, heaters, etc. That is right! The farmhouse should be made more comfortable. Money that is invested in a mortgage on Neighbor Jones's farm would often pay better in securing a mortgage on home comforts. . . . . There were, on exhibition, sod houses and log cabins showing how the pioneers in wood or on prairie were forced to deny themselves comforts and even necessities. There were men and women there who faced the frost and the blizzard in just such rough shelters. Now tney came with a well-earned competence—able to purchase the blessings that go with light, heat and water. As I watched them I often wondered what their life history would have been could they have enjoyed these blessings in partnership with youth and full strength. . . . . People like to "follow the crowd." I watched the crowd around one show on the Midway. The "barker" told his story in glowing language. His voice was cracked by hard usage, but he made up in noise what he lacked in tone. I sympathized with him, for I came somewhat near that business myself once! When he finally stopped, the band struck up and a small crowd of people started in, many of the others following them. I found that there were about a dozen young men and women who drew the crowd in, and then sneaked out of a side door and acted as decoys again. They did this so well that few suspected the trick, and they led hundreds into a very poor show who otherwise never would have started. Now, on a much larger scale this same game is played again and again in human society. Sometimes people make noble uses of the decoy system by leading the people on after desirable things. . . . . There was an exhibit of real Indians that would have delighted the Graft and the Scion. These little fellows get out behind the barn with wooden guns and knives, and slaughter dozens of imaginary Indians. How they would run for shelter could they see one of these genuine redskins! This was undoubtedly the real article. Among others was old Geronimo, the old rascal who killed and thieved for many years. This old scamp is now a "good Indian." He came out and grinned at the crowd and made a speech which was about as follows—"Money, money! Give money!" Surely money seems to be a sure thing with which to tame a red man—or a white one!

I was introduced to a civilized Indian who had been well educated. He wore good black clothes and looked like a college professor. I watched him as old Geronimo passed by in review. The young man took off his black hat and made a low bow to the murderous old rascal. What do you suppose the civilized Indian saw in the brutal savage that was noble enough to commend such a salute? . . . Three Eskimos took a day off on Saturday and walked about to see the sights. Of all tough looking specimens of humanity I have yet seen they go up head. No doubt the lady looked at her husband and then at the Hope Farm man and concluded that after all she had the handsomer specimen—from her point of view—so it's all right. This lubberly citizen walked into the famous Longfellow House, and to the surprise of all sat down to the piano (over 150 years old), spread his big fingers over the keys, and played many simple tunes. Surely music is the universal language! He was taught to play far up among the ice by a missionary!

Cider Machinery.—Send for catalogue to Boomer & Boschert Press Co., 118 West Water St., Syracuse, N.Y.

A HEN COUGH
85c per 100 square feet with caps and nails. In use by thousands of poultrymen
is fatal to poultry success. This is equally true of roup, frozen combs, etc. Your poultry will have none of these if their house is sided up and roofed over with
SWAN'S EXTRA HEAVY FELT ROOFING.
You can put it on yourself. It only takes a knife and a hammer—no experience necessary. Keeps out wind and water and is fire-proof. Soft and pliable; becomes as hard as slate. The ideal light structure roof. Send for free sample and circulars.
THE A. F. SWAN CO., 114 Nassau St., New York.

RUBEROID
THE
POULTRY-HOUSE
ROOFING
As a water-proof covering for Poultry-Houses, RUBEROID has no equal. Keeps the houses cool during the warm weather, and warm in Winter, and the chicks dry and comfortable. The sun cannot melt it.
THE STANDARD PAINT CO.,
100 William Street,
NEW YORK.

How to Drain Land Profitably.
On every farm there is probably some land that could be made more productive by underdrainage. Properly drained land can always be worked earlier, and more profitably. The ROUND TILE best and most economical way to drain is explained in the book, "Benefits of Drainage and How to Drain," which is sent *free* by JOHN H. JACKSON, 76 Third Avenue, Albany, N. Y.

A 2 million increase
In the past two years the sale of "Ball-Band" goods increased over two millions. Honesty, quality and fair prices made this increase possible.
"Ball-Band" Knit Boots, Socks, Rubber Boots, Shoes, and Arctics
have won the favor of farmers, ranchmen, lumbermen, etc., in every part of the country, through sterling merit. Made in many styles. Insist on getting the genuine "Ball-Band" Brand. Look for the *Red Ball* in the trade-mark. Get them of your dealer.
MISHAWAKA WOOLEN MFG. CO., Mishawaka, Ind.

THE BUSINESS FARMER'S PAPER.

A National Weekly Journal for Country and Suburban Homes.

Established 1850.

HERBERT W. COLLINGWOOD, Editor.
DR. WALTER VAN FLEET, H. E. VAN DEMAN, MRS. E. T. ROYLE, } Associates.
JOHN J. DILLON, Business Manager.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, SEPTEMBER 28, 1901.

IF any changes are to be made in the President's Cabinet we hope that the Department of Agriculture will remain as it is at present. Secretary James Wilson is by far the most useful man who has filled the chair of agriculture. He has won the respect and confidence of farmers, and from every consideration of business he should remain where he is.

*

THE American Pomological Society did a wise thing in finally limiting the time for reading and discussing the papers read before it. Some of these papers are altogether too long. They contain much useful information, and ought to be printed in the Society's reports, but they are not suited to public delivery, and are quite likely to send an audience to sleep. A brief and forcible synopsis is all that the audience should listen to.

*

APPLES which in ordinary seasons are not considered fit for anything but pig feed may be sold to advantage this year after being dried in the form of chops. The labor of preparing them is not great, as neither skin nor core is removed. The apple is cut in slices crosswise of the core, and may be dried either by sun or artificial heat. To bring the highest price, however, they should be bleached by exposing to the fumes of burning sulphur.

*

A FRIEND on page 665 refers to farm land in Illinois. This land produces a greater profit per acre than ever before, and yet the selling price is lower by 35 per cent. It formerly paid 10 per cent profit on its selling price, and will now pay nearly twice that on its cash value. Why is it? No wonder that question is asked, for if any other business offered such financial returns to an individual investor there would be a tremendous rush into it. What has deadened farm property?

*

"No, I want to see the trees. They are beautiful!" Thus spoke the death-stricken President to his nurse, as she was about to adjust his pillows so that the light from the window might not annoy him. These words, simple as they are, will impress themselves indelibly upon the memory and heart of every lover of trees the wide world over. How clearly and touchingly they reveal the innermost sweet unsullied nature of the dying man. Verily, the soul of any true tree lover does not wander very far astray.

*

PROF. L. H. Bailey, of Cornell Experiment Station, in a bulletin issued several years ago, claimed that "the Japan plums constitute the most important type of fruit introduced into North America during the last quarter of century," and the yearly crop of plums now being secured from the earlier planted trees well bears out the prediction. Scarcely a dozen years ago plums were a high-priced luxury only found in the markets of a few cities. Now the cottager and amateur may eat his fill of Burbank or Abundance, and the village grocer displays his boxes of plums in company with late berries and early tomatoes. The Japan plums have shown many weaknesses, and are unsparingly condemned by some growers, but it can no longer be denied that they are easily raised and give lots of good fruit. There are doubtless better plums than the Japan varieties now most generally planted, but so far as they belong to the European or Domestica type they are likely to remain of limited value on account of the restricted conditions under which they thrive. There is much hope of getting useful plums of excellent quality among the many hybrids now produced by plant breeders in various parts of the country, and in nearly every instance where real merit is evident a Japan variety is claimed as one of the parents. The time cannot be far distant when good plums will be as cheap and plentiful as grapes, thanks to this valuable introduction.

*

THE opening gun in the coming battle against oleo will be fired at the coming meeting of the Farmers' Congress at Sioux Falls, S. D. We are informed that efforts will be made by the oleo people to put this Congress on record as against the Grout bill. The honest butter delegates should go prepared to defend the interests they represent, and if any action at all is taken by the Congress it should be an emphatic endorsement of the principles of the Grout bill. What other action could be taken by a meeting supposed to further the interests of farmers?

*

THE Department of Agriculture has devised three simple and easy tests for oleo. We have already given them in THE R. N.-Y. These tests ought to form a part of the programme at fairs or farmers' institutes. There is usually present some dairy expert who is competent to show in this simple way how oleo differs from butter. It would make a very interesting exhibition and would, we believe, induce many people to try the test at home. It is of the utmost importance to educate buyers so that they will realize what oleo is and how it may be detected. The best friends of the farmers are the consumers who do not want to be deceived. Teach them the test!

*

FOR at least five minutes on the afternoon of September 19 the most complete quiet and rest fell upon the great city of New York that it has known for a century. Usually the city is never quiet. Thousands turn night into day, and labor while others sleep. The streets which through the day are crowded with those who follow trade or pleasure, at night contain groups of workmen who by the light of great flaring lamps, repair the pavement and dig sewers or ditches. So it may be said that New York never sleeps, yet for five minutes a hush like that of a rural Sunday afternoon held the great city in its gentle grasp. Not a wheel turned—not an arm was raised in labor or strife, for at that hour the body of the murdered President was being laid at rest. These brief silent moments meant more for the uplifting and truest good of this great city than the millions she has raised for charitable purposes during the past five years.

*

MUCH has been written and spoken regarding the public and private life of President McKinley. The world now knows the man as he was, and the President as he hoped to be. It is generally recognized by all that the great ambition of the President's life was to benefit and uplift his country in the way which seemed to him best. A short time before the assassination he concluded a striking speech as follows:

> Let us ever remember that our interest is in concord, not conflict; and that our real eminence rests in the victories of peace, not those of war. We hope that all who are represented here may be moved to higher and nobler effort for their own and the world's good, and that out of this city may come not only greater commerce and trade for us all, but, more essential than these, relations of mutual respect, confidence, and friendship which will deepen and endure. Our earnest prayer is that God will graciously vouchsafe prosperity, happiness and peace to all our neighbors and like blessings to all the people and powers of earth.

That of itself is the sincerest tribute which one could write. It should be the hope of all true men that the future may see this prayer answered.

*

THE writer recently ate breakfast at a hotel There was no printed bill of fare, but the waiter, after bringing the usual glass of water simply said:

"Fruit?"

"Yes, I would like a baked apple!"

"We aint got no apples!"

"What? No apples? That's a singular thing! Hundreds of people want to start the day properly, and after honest prayer there are few things more suitable to do it with than a good apple. Tell the proprietor for me that he ought to serve apples!"

A man at the foot of the table had listened to this conversation.

"I'll guarantee you belong to the Apple Consumers' League!" he said. "I've heard about that League, and it's a good thing. They will be serving baked apples here within a week!"

When we began to talk about the American Apple Consumers' League, three years ago, we must confess that the plan was partly a jest. We are glad to say that many people took it in dead earnest, and began to carry out the pledge at once. It is all very simple—we merely agree to call for apples in some form whenever we eat a meal at any public table. When apple has been omitted from the bill of fare we always call attention to it. The object is to increase the demand for this excellent fruit. We want to educate the people of town and city so that they will eat apples as freely as farmers eat them. Think what it would mean to the farmers of this country if such a course of education could be carried out! The best place to start such a reform is at the table where food is bought. The people to start it are those who buy such food. We would like to have 1,000,000 members of the American Apple Consumers' League—and have them all talk apple. The trouble is that hundreds of members say the League is a fine thing, but they are as silent as the grave when some bill of fare without even a mention of dried apple is put in their hands. We want members who are not afraid to move their Adam's apple for the benefit of their favorite fruit!

*

WE have heard good farmers say that ashes seed land to clover. Their argument is about as follows: For several years the field had no clover in it. They sowed no clover seed. The year after using ashes a fair crop of clover appeared. Where could it have come from except in the ashes? When we point out the fact that no seed could live in a fire hot enough to burn wood to ash they say: 'Well, where could the clover have come from?" Our explanation is that the clover seed was already in the soil, but the conditions were not right for its development. Seeds will live for years in this way. The ashes supplied what was needed, and the clover sprouted and grew. The ashes did not make new seed, but it gave the old seed opportunity. Sometimes a man will toil for years unrewarded and unrecognized. Then all at once opportunity comes to him and he prospers. Such a man is apt to say: "Oh, if I could only have had this chance years ago, when I needed it more!" Had it come to him then he would have failed with it. Through the hard years of toil he was unconsciously building up character and ripening judgment. Like the seed in the soil, these waited until opportunity made the conditions ready for their use.

*

STATE Master Norris, of the New York Grange, gives a good reason why the Grange grows in power and usefulness while other farm organizations flourish for a time and then decline. Most of these other organizations are built up on some political or business idea. For a time this is strong and popular, but in the very nature of the case such things must change. Something more attractive takes its place, for both politics and business shift about, and will carry an organization up or down with them. The Farmers' Alliance was strong, while what was known as Populism was a great political force. When that weakened the Alliance weakened with it. Not so with the Grange, which in spite of political changes grows stronger each year. Why? Because it is non-political, and does not depend on the whims of politicians. Instead of being based on the shifting foundation of politics it is built on the solid foundation of the farm home. It is a social organization with a place for every member of the family—from Grandmother to the baby. The common, homely things that make up the routine and aims of farm life and their solid and true development are the foundation principles of the Grange. That is why it is a constantly growing power.

*

BREVITIES.

POTASH brings in rag weed.

"SMALLER roots for planting."

HOW the pigs do like "pusley."

MUNCH a bunch of grapes for lunch.

A GOOD run often beats a bad stand.

BULKY food for the young brood sow.

SELFISHNESS makes home-groan fruit.

THE bee tells a tale with a clear point to it.

KILLING peach borers with "gas" is the latest fake.

EVERY corn grower has a right to the title of "kernel."

SHOULD die with the leaves in October—the surplus young rooster.

GET the stoves out of the shed. Beware the early Winter cold in the head.

YES, the California fruit crowds the market, but it increases the demand and doubles the fruit eaters.

THE Ohio Experiment Station finds that on poor soil heavy seeding (nine to 10 peeks) of wheat pays best.

ONE hard feature of it is that the President's slayer is an American—a distorted product of the American public school.

IN spite of the Government's low report on corn, we believe the price for this cereal is higher now than the situation justifies.

IT is said by the Vermont Experiment station that the feed bill of the State amounts to $10 for each inhabitant. Most of it is Western corn and bran—fed to cows.

THAT moth-catcher man is a very convincing talker. We will use his trap next year, and send the whole batch of captured insects to a good entomologist for identification.

Events of the Week

DOMESTIC.—An explosion in the powder works at Oakland, N. J., September 13, killed five men and injured eight others. . . . The Canadian Government, at the instance of the Imperial authorities, has disallowed two measures passed by the Legislature of British Columbia. One bill restricted Oriental immigration and the other concerned the employment of Chinese and Japanese on public works. . . . The great steel strike, which began on June 30, was brought to an end at a conference September 15, between the leaders of the Amalgamated Association and the officers of the subsidiary companies of the United States Steel Corporation. The full terms of the settlement were not divulged. . . . Crazy Snake, the Creek Indian, who led the rebellion last Spring against the Government, has been released, and is again inciting his people to rebellion. He claims to have come recently from Washington, where he ascertained that tribal rights are to be restored to the Indians. . . . Rev. Henry P. Whipple, Episcopal Bishop of Minnesota, died at Faribault, September 16, aged 79. He is known as the "Apostle to the Indians," having devoted himself both to their spiritual and material welfare in the Northwest for 40 years, and he received from them the aboriginal name of Straight Tongue. . . . A special commission has reported a resolution to the Texas House recommending that all States in the Union enact and enforce the most stringent laws for the complete suppression of anarchism.

ADMINISTRATION.—After lying in state at Buffalo one day, the remains of the late President were taken to Washington September 16, to lie in state there, the funeral being at Canton, O., September 19. . . . The official announcement of the physicians, as the result of their autopsy on the President's body, that death resulted from gangrene of the wounds, led to much discussion of the causes leading up to the gangrenous condition. It developed that Dr. Wasdin, one of the consulting physicians, and an expert of high standing in the Marine Hospital service, strongly supported the view that the murderous bullet had been poisoned, and that this was one of the moving causes of the dangerous conditions. The area of this dead and gangrened flesh was a source of much surprise to the surgeons, reaching a circumference about the size of a silver dollar about the internal wounds. The injury was fatal from the beginning. . . . Leon F. Czolgosz, alias Fred Nieman, was indicted in Buffalo September 16, for murder in the first degree. . . . The British Government has ordered 30 days' official mourning for President McKinley, and on the day of the funeral memorial services were held in St. Paul's Cathedral and Westminster Abbey, London, it being the first time such a service has ever been held in Westminster for a foreigner. All the European countries united in tributes to the dead President. . . . Concerning the new President, it may be said that he is the only man who ever rose from police commissioner to President. He is the youngest man who ever took the oath of office as President. He is the only New York City man ever in the Presidential chair. He is the only man of Knickerbocker stock who ever became President, except Martin Van Buren, of Kinderhook. He is the only Vice President with a military record who ever succeeded to the Presidency. . . . President Roosevelt announces that there will be no extraordinary session of Congress. The Constitution does not demand it, and, after discussion with those members of the Cabinet here, he decided that it was not necessary. At a meeting of the Cabinet September 14, President Roosevelt requested that the members retain their positions at least for the present, and they promised that they would do so. He also has received assurances that Secretaries Hay and Gage, who were absent, will also remain for the time being.

PORTO RICO.—It is reported that half the coffee crop has been partially ruined by the recent rainstorms, and that the banana crop has suffered serious damage. The poorer classes will probably appeal for assistance in consequence. The new railway bridge across the Anasco has been destroyed by the floods.

THE PHILIPPINES.—A force of brigands recently attacked and plundered the town of Castillina, Island of Negros, which was guarded by Filipino police. Three of the latter were killed and five were wounded. The military situation is unchanged.

FARM AND GARDEN.—The Illinois State Horticultural Society will hold its annual Winter meeting at Champaign December 10-12. A large exhibit of fruit is expected, the premium list being the same as last year. Secretary, L. R. Bryant, Princeton, Ill.

The managers of the Minnesota State Fair intend to make extensive improvements in their grounds at Hamline. It was decided that a machinery hall, a power and light plant, a permanent live stock pavilion, and addition to the grand stand, additional live stock barns and a new fence at the western end of the grounds are necessary. The necessity for a sheep barn was so evident, part of the exhibitors this year having to be contented with temporary outside pens, that the secretary was instructed to have a large sheep barn built this Fall.

The Southern Nurserymen's Association was in session recently at Asheville, N. C. By a unanimous vote it was decided to change the date of meeting to the third Monday in January each year, and Charleston, S. C., was chosen for the meeting of 1902. The following officers were elected: President, J. Van Lindley, Pomona, N. C.; vice-president, H. B. Chase, Huntsville, Ala.; secretary and treasurer, W. Lee Wilson, Winchester, Tenn. N. W. Hale was made chairman of the executive committee; G. H. Miller, Rome, Ga., chairman of the transportation committee, and S. Dougherty, Winsted, Tenn., chairman of the legislative committee.

The California State Fair was held at Sacramento September 2 to 14.

The New York Florists' Club will hold an Autumn exhibition at Madison Square Garden, New York City, October 21 to 28.

At a recent meeting of the British Columbia Fruit Growers' Association, it was decided that B. G. Stoddard, the expert fruit packer, of Portland, Ore., should give demonstrations of fruit packing during the progress of the Fall fairs at Ashcroft, Kamloops, Kelowna, Salmon Arm, and during the exhibitions at New Westminster and Victoria. A sample carload of mixed B. C. fruit was shipped to the Northwest, J. C. Metcalfe, of Hammond, traveling with the car as the representative of the Association.

TALK WITH A DRIED FRUIT MAN.

On account of the short apple crop this season an effort will be made to market in one way or another a large quantity that would ordinarily be considered fit only for hog feed. In order to learn from the dealers' standpoint what can be done in the way of drying this low grade fruit, an R. N. Y. reporter called on A. C. Worth, a dried-fruit merchant, at 51 Jay street, New York.

"Is there any demand for dried apples made from natural fruit which is so small or of such poor quality that it will not sell in the fresh fruit market?"

"Yes; such apples may be worked up into chops to advantage, which at present are selling at nearly twice last year's price."

"Would it pay to get a chop machine for making up as small a quantity as 10 or 15 barrels?"

"I doubt it. My judgment is that one should have nearly 100 barrels to make the best use of one of these machines."

"How, then, can a man who has only a few barrels of this fruit handle it?"

"He can make the chops without a machine. All that is necessary is to take a knife and cut the apple in slices crosswise the core, without peeling."

"How thick should the slices be?"

"That is not material, but, of course, the thinner and more nearly uniform they are, the quicker and more evenly they dry. They may be dried in the sun or by artificial heat."

"Is that all there is to it?"

"To bring the highest prices they should be bleached."

"How is this done?"

"By exposing them to sulphur fumes for a short time. This operation cannot be carried on very well in a living room, as the fumes would be offensive. The fruit in trays could be put into a box out of doors and the sulphur burned in the bottom. Of course, where drying is done on a large scale, special appliances are used. I am now speaking of methods that might be employed where only a few apples are being prepared."

"How long should they be exposed to the sulphur fumes?"

"That cannot be answered definitely, and can only be told by trying. The flesh of properly bleached apples is of a light cream color."

"Can windfall apples be used?"

"Yes, anything that is not rotten may be worked up into chops."

"What about the better grades that are intended for drying?"

"More care should be taken with them. They may be peeled and quartered, and, of course, should be bleached."

"Are the cores and skins of any value?"

"Yes; when dried they bring nearly as high prices as chops."

These chops and cores and skins do not look at all inviting. Of course, they are not fit to be stewed up into apple sauce, for an apple that is not suitable for food when fresh cannot be much improved by drying. It is said that a large quantity of this waste is used in the manufacture of wines. Those who attempt to make apple chops by hand would do well to go rather carefully on the start, as with a sharp knife and a few reckless moves one may find himself minus a finger-tip.

FRUIT EXHIBIT AT THE N. Y. STATE FAIR.

It was said by many that this was the finest exhibit of hardy fruits ever seen in the United States, and it certainly was much larger than any previous exhibit at this State Fair. The fine quality of fruit shown was noticeable, this being an off year for most kinds of fruit in New York State. The amount exhibited and the interest shown by the horticultural societies of the State were very gratifying. The fine collection of apples, plums, peaches and pears shown by the New York State Experiment Station of Geneva was admirable. The Station should be complimented upon the neatness and completeness of its exhibit. The exhibit of the Cornell Experiment Station, consisting of about 40 plates each of plums and grapes, was of fine quality. The exhibit of cold storage apples, crop of 1900, shown by the New York State Pan-American Commission, was noteworthy. While it is impossible to mention all of the individual exhibits of merit, I shall mention those that struck me most forcibly. Ellwanger & Barry's collection of pears and grapes was as usual of the finest quality, and occupied a prominent position. C. C. Corby, Montclair, N. J., this year, as usual, brought his collection of grapes, and size of cluster and berry being considered, they were the finest shown. S. D. Willard, Geneva, was on hand with his largest and best collection of plums, and William Palmer, Grooms, with collection of pears, apples and plums. Grant Hitchings, South Onondaga, exhibited apples alone, and I have never seen a collection of apples grown by one man that would surpass it in size of varieties, color and quality of exhibit as a whole. Mr. Hitchings advocates a new method of apple culture, and his results, as seen this year at the New York State Fair, would justify any apple grower in investigating his methods. M. F. Peck & Nephew, Albany, Ontario, Canada, exhibited a fine lot of apples, and a large number of varieties of the finest quality. David K. Bell, Rochester, showed in single plates and collections of pears, and, as usual, took a large share of the premiums. The New York State Fruit Growers' Association, which was organized about six months ago, captured the first premium for the largest and best exhibit by any horticultural society. Its members certainly did respond to the call for fruit with a will. They were handicapped by being compelled to move from a small to a larger tent, so did not have the time to arrange their exhibit in good form for the first day of the Fair. They made an exceptionally fine show in peaches and apples. The Western New York Horticultural Society's exhibit was a model of neatness, and in quality as a whole, I think was the finest of the three societies. The New York State Fruit Growers surpassed them on number of plates and number of varieties of peaches, plums, apples and grapes. In talking with some of the members of the different societies, the question was raised if it was practical to have the Society prize awarded to the society having the largest number of correctly named varieties and best quality, leaving out the largest number of plates. A very large number of duplicates was noted in the different exhibits. V. B.

THE CANADIAN CENSUS RETURNS.

The slow rate of increase is caused, to a certain extent, by better inducements to other countries, which have been a heavy drain to this country in the last 20 years. Farm lands seem to be about the same as 20 years ago, but the values have risen and fallen since then. In some localities it is no trouble to dispose of a farm, especially those having conveniences, such as being near a good market or a good road, and the income from such is, I think, equal to former years, but those away back have depreciated, as all farms situated as above stated have a certain amount of fruit which is always in demand, and those farther back have sailed in the same old boat that their grandfathers did.

Ancaster, Ont. J. F. S.

Regarding census returns, the small increase for the Province of Ontario can be accounted for on account of the migration to Manitoba and the Canadian Northwest. Also, the families of the present generation are much smaller than those of previous years, the present being only two to four against eight to 12 formerly. On the whole, the returns are not satisfactory. The values of farm lands are higher by 50 per cent than 20 years ago in the Niagara Peninsula. Farms of 200 or 300 acres have been divided and sold in lots of 10 to 50 acres for fruit growing, which has given fairly good returns to the grower. The incomes are better than in former years, from the same number of acres. R. R. G.

Hamilton, Ont.

To the patriotic Canadian farmer the late census returns are not very satisfactory, seeing there is a general decrease of the rural population in the older sections of the Dominion. It would seem that there is a general tendency to drift toward the large cities and to "go west" into the newer regions. This, of course, indicates a dissatisfaction with conditions in the older rural sections, or at least a desire on the part of many to better themselves. No doubt this same influence has induced not a few to seek their fortunes in the United States. Farm lands have depreciated in value during the last 20 years at least 25 per cent, with a firmer tendency and slight increase within the last two or three years. While this is true generally, in some cases farm lands have not only not decreased in value but have increased, especially in districts where fruit growing is the leading industry. Those farmers who are industrious and able to take advantage of the present facilities for gaining a better knowledge of the principles of successful farming, and who can adapt themselves to the varying and ever-changing conditions, receive as large an income as formerly, and I am of the opinion that in many cases of failure to make both ends meet the cause has been increased expenses rather than diminished incomes. In this locality farm lands meet a rather readier sale than a few years ago, though there are not very many farms changing hands or being offered for sale. L. E. H.

Tintern, Ont.

Farm Lands in Illinois.

I have been interested in reading the notes on farm values in THE R. N.-Y. for some time, and am at a loss to know why the property is almost universally rated at a depreciation of 25 to 40 per cent. Better to illustrate this I have in mind a farm of 185 acres, with a fine equipment of good buildings, fine water for stock and a large supply of all kinds of fruit. In 1882 the owner was offered $100 per acre for it, and refused to sell at that price; it paid a net profit of 10 per cent on the valuation. The same place, under the same management, now pays 15 per cent on the offered price, and the owner (owing to old age he wishes to sell) can't get a bid of $65 per acre for it. This land is near the Illinois Central Railroad, that furnishes the best of transportation facilities to Chicago, St. Louis, Minneapolis, Omaha, Milwaukee and other good markets, and the soil will produce the finest crops of wheat, corn, hay and all kinds of fruit and vegetables. Many acres have this year paid a net profit of $250 to $300 each in cucumbers and Gem melons, while strawberries average $75 to $100 per acre net each year. But with all this the land continues to depreciate in selling price, while the taxes are held up to the highest limit. Why is it so? G. W. E.

Villa Ridge, Ill.

Crop and Weather Notes.

There have been frosts in the upper Missouri Valley and northern California. Cool weather has checked the maturing of corn in the the Central West, yet most of it is believed to be out of danger of frost. The hop crop in Washington is suffering for lack of sunshine. Heavy rains in Texas, Arkansas and Mississippi have interfered with cotton picking, and damaged the crop. In the South Atlantic States drought is damaging crops. Plowing for Fall grain has advanced rapidly where the rains have not been excessive. Heavy winds have blown off many of the apples remaining on the trees in Illinois and Indiana.

SEPTEMBER 12.—We have had a good, heavy rain in the past week, the first of any account since July 4, although there has been plenty of rain within 10 miles north of us all Summer. Crops somewhat streaked; some places a full crop, and in others only one-half crop. Several earloads of corn harvesters have been sold at Cresco, and much corn is being cut for fodder; cutting about half done. Oats went from 20 to 40 bushels per acre, worth 30 to 35 cents. Not much wheat raised here. Flax, from five to 15 bushels, mostly sold at $1.50, now at $1.25. Hay, $6 to $8, not half crop. Hogs, about $6 for the best; no cholera reported so far this Fall. Cattle and sheep rather off in price. Pastures poor. Clover seed, where saved, turning out well. Potatoes high; have been selling all Fall for $1.50 to $1.75 per bushel. Late potatoes will be one-half crop. No apples. Land has at least doubled in value in the last 12 or 15 years, with much changing hands. Land that could have been bought 15 years ago at $10 per acre is now worth $40. Land in this vicinity is worth from $35 to $80, with some pieces close to town or with extra improvements worth more. Values have gone up $10 to $15 in the past year. W. R.

Cresco, Iowa.

From Day to Day.

INTERFUSED.

We must buy and sell in the markets; we must earn our daily bread;
But just in the doing these usual acts may the soul be helped and fed.
It is not in keeping the day's work and the day's prayer separate so,
But by mixing the prayer with the labor, that the soul is taught to grow.

For if sweeping a room by God's law is a service He deigns to bless,
And mending a kettle worthily is working for Him no less
Than steering steady the ship of State, or wielding the sword in war,
Or lifting the soul of man by songs to the heights where the angels are—

Then none may deem it wasted time who stands in a humble spot
And digs and waters a little space which the hurrying world heeds not;
For the Lord of the harvest equally sends His blessed sun and rain
On the large work and the little work, and none of it is in vain.

—Susan Coolidge.

*

HOUSEKEEPERS who make their quilts or comfortables at home grow fewer year by year, but for the convenience of those who do this it is now possible to buy cotton batting in sheets the width and length of the bed. It is much easier to make the comfortable with such batting than with the narrow rolls.

*

GOOD cooks nowadays use an oven thermometer to tell whether the heat is just right for cooking. A safe guide, however, is a piece of white paper. Put it in the oven for five minutes; if, at the end of that time it is charred the oven is too hot; if dark brown it is right for small pastries and cookies; if light brown for pound cakes and pie crust; if only a dark yellow, it is just right for sponge cake, bread, and other things requiring a steady and moderate heat.

*

ADULTS often find it difficult to understand a child's literary tastes, and the following little incident gives a point of view we often overlook: In one of the large city libraries, with a well equipped juvenile department, a little girl recently asked for "a good book," and, when offered one by an author whose specialty is believed to be child-delineation, firmly shook her head. "I had it last week," she said. "It isn't a children's book." "I thought it was," apologized the librarian. "Well"—somewhat relenting—"it's a kind of a children's book. It's not a children's children's book, that's all!"

*

WE saw a highly interested class in nature study over in City Hall Park recently. Half a dozen small boys clustered together, deeply absorbed in their researches, and displaying enough enthusiasm to put a halo around Cornell. We had noticed one eight-year-old, whose appearance certainly suggested that he was made from the dust of the earth, groping about the edges of a flower bed, whence he had rescued the exhibit which gathered them together.

"Get on to his Blackwell Island stripes," observed a small and slightly damaged naturalist with a fading black eye. "Gee whiz! Look at them legs—he's got six!" observed another.

"He aint," objected a small pessimist on the outer edge of the group, whose visible attire consisted of two very well ventilated garments. "Bugs only has four legs, same as dogs and cats."

"Aw, you don't know nothin' about it," haughtily observed the boy in the middle. "Some has more'n a thousand legs—I seen 'em," and just then we got close enough to see what they were studying. It was a serious and corpulent Potato beetle, which, having lost its way, possibly in an effort to escape from New Jersey to Long Island, had become stranded in City Hall Park. Just think of a pernicious Potato beetle becoming an object of respectful curiosity! We don't know whether the discussion threw any new light on the moral attributes of the Potato beetle, but it gave the boys a healthy interest for a few minutes, so one of those six-legged pirates, at least, did not live entirely in vain.

*

A HOUSEKEEPER who has been annoyed by fading rugs and curtains says she now remedies this trouble very satisfactorily. She selects some good dye of the color desired, mixes a little with cold water in a cup, and applies this to the faded surface with an old tooth-brush or nailbrush. Faded rugs are rubbed over, a little at a time, until the surface is the same color as the pile underneath, and the same process is used to restore gimps, cords and bindings, which often grow shabby while the upholstery they edge is still fresh. Such a process will be found useful in renovating many house furnishings.

*

WE are asked how to mix a boiled mustard sauce. Here are two simple methods: Beat well together three tablespoonfuls of mustard, three tablespoonfuls of sugar and one egg. Beating well means in this instance that the mixture must be well blended and every little lump must have disappeared before the beating ceases. Now add one cupful of vinegar. Put the mixture in a saucepan and cook until it boils. Then add one teaspoonful of butter and beat again until smooth. Or, to follow the other method, mix together two tablespoonfuls of mustard and one tablespoonful of flour. Mix one-half cupful of vinegar with one-half cupful of water and stir into the flour and mustard. Cook this as you would for a boiled custard. Add one teaspoonful of sugar, one tablespoonful of butter and a little ground celery or celery salt.

AN ISLAND PICNIC IN MICHIGAN. FIG. 298.

Rural Recipes.

Sweet Pickled Gherkins.—Make a brine of coarse salt and water that is strong enough to bear an egg. Gather your small cucumbers each day; when they are dry wipe them well and put them into the brine; cover them with cabbage, grape or horseradish leaves; place a weight on top to keep them under the brine. When you wish to have fresh pickles take as many as desired from the brine, wash and soak them in cold, fresh water for two hours, changing the water once or twice, according to how long they have been in the brine and their size. For 50 cucumbers take two quarts of best cider vinegar; add an ounce of pepper corns, half an ounce of mustard seed, an ounce of green ginger sliced, half an ounce of mace, a small root of horseradish sliced and a cupful of sugar; a few bay or tarragon leaves improves them. Tie the spices in muslin bags; boil all together for 15 minutes and then pour over the pickles. The pickles will be more brittle if they are not scalded, but not so green. If you desire you can green them in the following manner, but do not use alum or brass or copper vessels; line your kettle with cabbage leaves, bottom and sides, and put in the vinegar and pickles after they have become cold; cover the top with the green leaves and let them heat gently; if the first scalding does not make them green enough, repeat, adding fresh leaves.

Tomato Mustard.—Slice half a bushel of ripe tomatoes, bruise half a dozen small red peppers and add to the tomatoes; boil for one hour, then rub through a coarse sieve, add two tablespoonfuls of black pepper, two ounces of ginger, an ounce of allspice, half an ounce of cloves, eighth of an ounce of mace, quarter of a pound of salt; boil gently for an hour. When cold stir in two ounces of mustard, two of curry powder and a pint of vinegar.

Okra Soup.—Cut in slices a quarter of a pound of bacon, put it in a frying pan, fry gently for a few minutes and add a sliced onion and one quart of green okra pods cut into small pieces. Put the lid on and fry the okras for 30 minutes. At the end of this time take out the bits of bacon, the okra pods and onion, and add three tablespoonfuls of flour to the fat in the pan and let it get a rich brown. In the meantime put the okra and onions and bits of bacon in a saucepan with two quarts of stock; add the fat to this and simmer gently for three hours. Then strain through a fine sieve, season with a teaspoonful of salt and a quarter of a teaspoonful of paprika and a pint of cold diced chicken meat. (If the cold chicken is not on hand, the soup is quite delicious without.) Simmer for 20 minutes longer, and serve either hot or cold.

Peach Cups.—Beat two eggs without separating until light; add them to a pint of milk. Measure 2½ cupfuls of sifted flour; add half a teaspoonful of salt and two tablespoonfuls of baking powder and sift twice again. Make a well in center of the flour, pour the liquid in gradually, stirring it into the flour until you have a thick batter; add two level tablespoonfuls of melted butter and mix well. Grease small custard cups or muffin tins; drop in a spoonful of the batter, then half a ripe, yellow peach pared and stone removed, placing the hollow side of the peach up. Cover with another spoonful of the batter and dust with powdered sugar. These can be either steamed half an hour or baked in the oven for 20 minutes. Serve with orange sauce.

German Coffee Cake.—One cake compressed yeast, one quart sweet milk, one cupful sugar, one cupful raisins, one-half cupful butter, a saltspoonful of nutmeg, grated rind of lemon, a scant teaspoonful of salt, flour sufficient to make a soft dough. Allow milk to come to a boil and then cool until just warm; break yeast into one cupful of the milk and allow it to dissolve; then stir in sufficient flour to make a batter; when light, mix in remainder of the milk, sugar, raisins, butter, salt, nutmeg and lemon rind; then stir in sufficient flour to make the consistency of bread (care must be taken not to get in too much flour) and mold with your hands for about five minutes; set in a warm place to rise again; when light, divide into four equal parts, roll out on breadboard and place in shallow pans; allow it to rise once more, then put dabs of butter on top of it, and sprinkle sugar and cinnamon over the whole; bake in moderate oven 25 minutes.

German Pancake.—Sift and then weigh half a pound of flour. Beat three good-sized eggs until light, make a well in the center of the flour and gradually work the eggs into flour until you have a smooth batter free from lumps. Add a tablespoonful of powdered sugar and gradually half a pint of cold milk. Beat the batter again until very smooth and light. Heat a frying pan and when it is hot brush it well with melted butter and pour in the batter. Cover with a pint of preserved pineapple or preserved apples and set in a hot oven for 12 or 15 minutes or until the batter is thoroughly cooked through under the fruit. Then slide it carefully out of the pan on to a hot plate. Sift powdered sugar over it and serve at once.

Butter Rolls.—Dissolve two tablespoonfuls of butter in one pint of scalded milk. When cool add one scant teaspoonful of salt, one tablespoonful of sugar, one-half of a yeast cake dissolved in a little warm water and enough flour to make a soft dough. Knead lightly for five minutes and set aside to rise. When very light make into small rolls and let rise again; then bake in moderate oven 20 minutes.

Vienna Puffs.—Crumble one-half yeast cake into one cupful warm water, add one-half teacupful sugar and set in a warm place until it rises to the surface. Add to it one pint flour, one tablespoonful of butter, one-half teaspoonful salt, one tablespoonful sugar, and one egg. Mix well, cover and let rise till morning, butter gem pans, fill half full and bake quickly.

A Michigan Picnic.

One of our friends in Michigan, F. Hodgman, of Owosso County, sends us the picture of a farm picnic, shown at Fig. 298. It is a happy-faced and intelligent group, and there is no reason to ask any of them whether they enjoy the day's outing, for they show their condition of mind very plainly. Mr. Hodgman celebrates the festival in the following verses:

When the hay is safely gathered
And the grain is in the stack—
When the hurrying time is over
And the work is getting slack—
Then we join with friends and neighbors,
Bringing chicken pie and cake,
And we have a little picnic
On the island at the lake.

When the days are getting shorter,
Ere the seeding time has come,
And the puffing traction engine
Makes the busy thrasher hum,
When it's time to go a fishing
Or a little outing take,
Then we have our little picnic
On the island at the lake.

Then we harness up the horses
And we hitch 'em to the rig—
And we tumble in the babies
All the little folks and big—
All the good things and the fixings
And it's then the road we take,
Gaily going to the picnic
On the island at the lake.

It is safe to say that everyone who participates in the day's outing is the better for it, in mind and body, and better able to take up plain duty again. That is our ideal of a picnic—not a big, noisy excursion among strangers, but a happy and rational day, spent with friends and neighbors. Such a gathering would be an admirable feature for any rural community.

Women Exhibitors at Agricultural Fairs.

As the season for agricultural fairs draws nigh it is a wise plan to think the matter over practically, with a view to making them a source of profit as well as pleasure. All enterprising farmers' wives and daughters should make it a point of exhibiting specimens of their work at any county fairs possible, not only with the intention of helping the societies, but because it will yield a good revenue for the trouble and expense entailed. Nor are county fairs the only places where a person can successfully exhibit, for frequently the display of fancy work is much inferior at the State fairs to those of the county. The vegetables, flowers and anything pertaining to manufactory display are always exceedingly fine, but the hand needlework, or paintings, and culinary display often fall short of the ordinary county fair, while the premiums are much larger. The year of the World's Fair at Chicago a woman of my acquaintance living in New York State, in a small country town, paid expenses—somewhere in the neighborhood of $100, for this trip, with her premium money for exhibits at two adjoining county fairs. Another energetic young woman whom I know usually depends on her premium money for a Winter's wardrobe, besides many other small luxuries which would not otherwise be indulged in. Still another woman devotes her premium money to the purchasing of handsome articles of tableware or furniture, each year getting one very nice article, which she can keep as souvenirs of her own individual labor. Solid silver spoons, forks and other articles of like description are not to be despised as practical mementoes.

The first requirement for preparing for a fair is to utilize common sense; I frequently hear a skeptical ill-natured woman sarcastically remark: "There is no use of my entering anything at the county fair; I couldn't get any premiums if I did. Only just a few of the favorites get those, and I do not belong to that set." There are no favored few at any local fair I ever came in contact with. The officers are appointed, and strictly honorable, upright men are chosen to fill the places, with by-laws and regulations governing each society, which are strictly and conscientiously carried out. The judges are appointed afresh each year, and usually from neighboring towns. As no names are permissible on the entry cards attached to each article, they know nothing whatever of those who own the goods, and favoritism is not easily indulged in, even if a judge felt so disposed. But looking into this matter and reviewing a list of the prize winners it is often found that some win many more premiums than others, while new exhibitors receive very few, or frequently none whatever, though their articles are far superior to the prize-bearing ones. This is literally true. Many very beautiful specimens of needlework will not be awarded a premium, when a much inferior article will win one. This mistake is unjustly laid to incompetent judges, favoritism and anything but the rightful cause; it will invariably be found that the article in question was not entered in the class in which it belonged, and the judges were unable to prevent this.

There are always catalogues issued annually in advance of each county fair. A would-be exhibitor should procure one of these little books for each fair she contemplates exhibiting at, and follow out the rules there inscribed accurately. No trouble will follow if every article is properly labeled, and correctly entered in the class in which it belongs, with the entry card securely fastened so it cannot come off. Judges are frequently sorely tried by several loose entry cards, which are often replaced on the wrong articles. This trouble arises in every department of the exhibition, not only in the domestic hall, which is usually devoted to needlework, but in the hall containing canned goods, cooking, etc., it is still more trying; there are few articles more addicted to losing their entry cards than cups of jelly, jams or preserves, and when there are several hundreds of these, each an exact fac-simile of its neighbor, it is not at all surprising that mistakes arise, and more or less dissatisfaction is felt at the non-appearance of the coveted red and blue tickets. It is always

3919 Fancy Waist,
32 to 40 Bust.

the new exhibitors whose carelessness causes the trouble. A person accustomed to making fair entries, has bought her experience and rarely makes blunders, and thereby usually secures numerous premiums, and is accused by less fortunate ones of being shown undue favor. In reality she has only been careful, exhibiting no better articles than her less fortunate neighbor.

I heard a very successful exhibitor say in reference to fair work: "I always commence at the first of the season, and put up a little of each kind of fruit, with the intention of exhibiting at the county fairs the following Autumn, making it of a superior quality for this purpose. There is no use entering inferior articles to compete with better ones." As strawberries come first, a few cans, and a small quantity each of jam, jelly and preserves were made with this end in view, and so on, taking each fruit as it came, storing the work by itself, so it would not get mixed with the other fruit. As she said, the actual expense was very trifling in comparison with the premiums she received, compensating her fully for the work it created. All of the fruit could be used in the family after exhibiting, and only the canned fruit required reheating; no harm came to other preparations. There is no need to add that she always won many premiums; for the same systematic rules were followed out as for any other well-organized business.

There is something else to be remembered; do not enter articles which are not listed in the catalogue, expecting to receive premiums. Occasionally they will be awarded a special premium, but this is an exception, not the rule, and they are more frequently passed over, only those included in the premium list receiving attention. Many beautiful things not specified are entered each year, adding much to the display as well as giving new ideas, which may be of use in constructing the catalogue of premium lists the following year. A failure is often the forerunner of success. Refrain from making sarcastic remarks over either real or fancied injustice; bear your disappointments Spartan-like; for it does no real good to complain, and only makes others pronounce you disagreeable. I once heard a fair official wearily remark: "It is surprising how much rancor the loss of a 25-cent premium will bring out in some people." Even if you know you have been unfairly dealt with, next time you will be sure to succeed as a reward for your forbearance. The week before the fair takes place carefully make out your list of articles intended for exhibition; take or send it to the secretary of the society, and get your entry cards, which are securely fastened on the articles at home, correctly without any worry, which will inevitably accrue if this is left until you reach the fair grounds. There is much less danger of mistakes being made, both with you and with those who make your entries. Being a successful exhibitor is really only a matter of care and forethought.

SARAH RODNEY.

The Rural Patterns.

Waists buttoning down the back remain in favor, and the model shown is especially pretty because of the fullness allowed by the groups of tucks. The original is of louisine silk, with cream guipure lace, and is made over the fitted lining, but all waist and gown materials are suitable, silk, wool and cotton, and the lining can be omitted whenever desirable. Silks and wools are better and more serviceable made over the foundation, but washable fabrics are preferable unlined. The fitted foundation is snug and smooth and closes at the back, together with the waist. The fronts proper are tucked to yoke depth and gathered at the waist line, but the backs are plain across the shoulders and show only slight fullness at the belt. The lace is applied over the material on indicated lines, the scalloped edge making an admirable effect over the plain waist. The sleeves are in bishop style, with pointed cuffs, and the neck is finished with a plain stock, to which are attached turn-over portions of lace. To cut this waist for a woman of medium size, 3½ yards of material 21 inches wide, three yards 27 inches wide, 2½ yards 32 inches wide or 2⅛ yards 44 inches wide will be required, with 1½ yard of lace 7½ inches wide, and ⅜ yard of narrow edging to trim as illustrated. The pattern No. 3919 is cut in sizes for 32, 34, 36, 38 and 40-inch bust measure; price 10 cents from this office.

The tendency of all the latest skirts is to extreme snugness at the upper and pronounced flare at the lower portion. No style contributes to that end so perfectly as the habit back and the circular flounce, and the two combined make a marked feature of advance models. The model shown is admirable in every way. Being cut in five gores it suits the great majority of figures and allows for

3920 Five-Gored Skirt,
22 to 30 waist.

remodeling the skirts of last season when so doing is desirable. The original is made of novelty material, in shades of brown and tan, with trimming of narrow brown braid over light tan, and includes the graceful and becoming flounce; but this last can be omitted and the skirt used plain; or, again, the material can be cut away beneath and the flounce seamed to the lower edge. The five gores are carefully shaped and fitted without fullness at the belt, and provide just the snugness required by fashion. The flounce falls in soft undulating folds and widens as it approaches the back, forming admirable lines. The placket can be at the center back or left front seam as desired, but in either case, should be provided with an ample underlap and an abundant supply of hooks and loops, that there may be no danger of gaping. To cut this skirt for a woman of medium size, 13 yards of material 21 inches wide, 10½ yards 27 inches wide, 8⅞ yards 32 inches wide, 7¼ yards 44 inches wide, or 6¾ yards 50 inches wide will be required when flounce is used; nine yards 21 inches wide, seven yards 27 inches wide, 6½ yards 32 inches wide, 5½ yards 44 inches wide or five yards 50 inches wide when flounce is omitted. The pattern No. 3920 is cut in sizes for a 22, 24, 26, 28 and 30-inch waist measure; price 10 cents from this office.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

AN ounce of cheerfulness is worth a pound of sadness to serve God with.—Fuller.

IT is often said that God condemned men to work. This is absurd. God condemned man to live, and gave him work as a mitigating circumstance.—Legouve.

To be gentle and humane to every creature of God is the duty of every man, but more especially of every Christian man who claims to be a follower of One who went about doing good.—Father Ducey.

A Go-to-Church Lantern

The Dietz Junior Lantern is just the right one for this purpose, also for any other purpose which calls for a light weight, convenient lantern, giving a fine bright light. The farmer's wife will especially appreciate it. We send one by express, prepaid, for $1.00, and we give your money back if it doesn't suit you. That's fair enough. Circulars free.

CONSUMPTION CURED.

An old physician, retired from practice, had placed in his hands by an East India missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma and all Throat and Lung Affections; also a positive and radical cure for Nervous Debility and all Nervous Complaints. Having tested its wonderful curative powers in thousands of cases, and desiring to relieve human suffering, I will send free of charge to all who wish it, this recipe, in German, French or English, with full directions for preparing and using. Sent by mail by addressing, with stamp, naming this paper, W. A. Noyes, *847 Powers Block, Rochester, N. Y.*

BUSINESS BITS.

THE Keystone dishorning knife, which is the invention of the late A. C. Brosius, is now manufactured and sold by M. T. Phillips, Pomeroy, Pa. Mr. Phillips has ample facilities for manufacture, and all orders will be filled promptly. A prejudice which is fast wearing away is the thing unfavorable to universal dishorning, and we bespeak a larger use of the dishorner from year to year. If interested write the manufacturer for full information and prices.

THE advantages of having a constant supply of water always before the cows are too well known to need argument. With Chency system of basins, a constant supply of fresh water is assured to each animal, and each basin is replenished from the *tank;* water cannot flow from one basin into another, thus avoiding the danger of contagion. Anyone building a wooden cow barn or remodeling an old one should consider well the advantage of the individual watering basin. Write to S. Cheney & Son, Manlius, N. Y., for prices and full information.

Hubbard Squash for Canners.

One of our readers in Maryland was offered $6 per ton for Hubbard squash delivered at the factory of a local canner, and he thinks of trying two acres. He wishes to know whether the price, $6 per ton, is a fair one. What would be a good yield under what might fairly be considered favorable conditions in growing this crop?

Six dollars per ton for this squash I should consider a death and destruction price for the grower. He could hardly expect (in ordinary farming) to raise over five or six tons to the acre. Ten dollars per ton is as low as I have ever known squash sold for canning purpose. J. J. H. GREGORY.

Massachusetts.

Marrow squashes are quite largely grown in south Jersey for canners at $6 to $8 per ton. They are quite frequently grown on land as a second crop after early potatoes, peas or other crops. We do not know of the Hubbard being grown locally for this purpose, but should think it fully as prolific as the marrows, though probably not as quick in growth nor as early fruiting.

Pennsylvania. E. D. DARLINGTON.

As to yield here it is measured by the barrel. A yield of 50 barrels (4½ tons) per acre is called a fair yield, although occasionally we have had as high as 80 barrels (7½ tons) per acre. They weigh about the same as potatoes per barrel, or 180 pounds. One of our largest growers thinks no man could afford to grow at $6 per ton. He usually gets from $1.25 to $1.50 per barrel; the prices vary. He planted last June, 12x14 feet; has much work to hunt the borer, etc.

Long Island. N. HALLOCK.

Wants, For Sale or Exchange

Farm Managers, Gardeners, Buttermakers, etc., always on hand. No charges to employers. Write us Rural Science Agency, Durham, N. H.

VALUABLE FARM FOR SALE.—1,000 acres, susceptible of many subdivisions, situated on Dan River, with much river, creek and branch bottoms; nine miles from Reidsville, N. C., a town of 5,000 people, on the main trunk line of Southern Railway Company. In county of Rockingham, Piedmont section. Splendid six-room mansion, and numerous tenant settlements.
JOHN T. PANNILL, Reidsville, N. C.

Cash For Your Farm

Residence or Business Property may be obtained through me. No matter where located. Send description and selling price, and learn my successful plan. W. M. Ostrander, North American Bldg., Phila., Pa.

Money-Making Farms

BORDER the Kennebec Valley lakes; dairy, sheep, stock, fruit, poultry; near railroad, schools, churches; comfortable buildings, shady lawns, fine fishing and boating; $10 an acre; fare by boat, $1.75 from Boston. Particulars free.
E. A. STROUT, 9 Scott Street, Augusta, Me.

ASPARAGUS FARM FOR SALE

IN SOUTH CAROLINA. Fifty acres growing asparagus. A rare opportunity. Address E. H., P. O. Box 1592, Philadelphia, Pa.

For Sale—Gentleman's Farm.

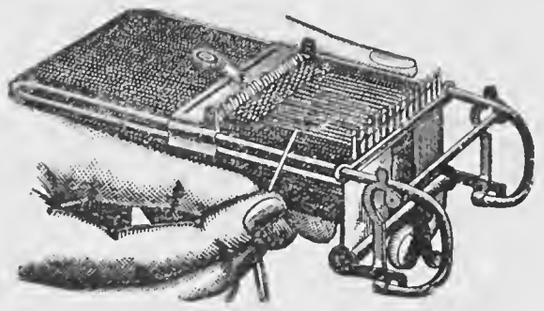
One hour from New York City by Central Railroad of New Jersey. In close proximity to a growing town. No malaria. Good society. About 110 acres, in two farms, mostly in grass. This year's first crop 235 large two-horse wagon loads of hay; second crop very promising. Home market. Modern buildings. Chance for speculation in building lots. Owner having taken up his residence in Europe, will sell this place below value. For circular address owner
FREDERICK LOESER, Personal,
484 Fulton Street, Brooklyn, N. Y.
Real Estate Agents please enclose their card.

Apples and Pears

This time of the year we make a specialty of handling shipments of apples and pears, and are now prepared to handle consignments to the best possible advantage. Write us at once for information regarding shipping, etc.; also for stencils.
ARCHDEACON & CO., 100 Murray St., New York

A Darning Machine.

This is the only successful darning machine we ever saw. We have tried others that were absolutely of no value. This one is little short of perfect. It enables you to mend underwear, stockings, curtains, table linens, clothing, and does an endless variety of art and fancy weaving better, easier and quicker than



by any other way. Full directions accompany each machine. When a lady has once used this little machine, she would not do without it for any consideration. We will send it postpaid for $1, or for two new yearly subscriptions at $1 each. All money returned if not satisfied.

4 Dolls FREE

Every little girl loves a doll. How delighted she would be with a whole family of big dolls with which to "play house." These dolls are nearly two feet high, have rosy cheeks, beautiful hair, heads that will not break, eyes that will not fall in, nor suffer any of the mishaps that dollies are likely to encounter. They are the 20th Century model of the old fashioned doll that Grandma used to make, and would make Grandma open her eyes in wonder. They are made of extra heavy satteen that will not tear, and are dressed in bright colors that will not fade. They are very durable and will give a child more real pleasure than any doll made. We will give these four beautiful dolls absolutely free for selling only five boxes of our Laxative Stomach Tablets at 25 cents a box. Write to-day and we will send the Tablets by mail postpaid. When sold send us the money ($1.25) and we will send you the four dolls same day money is received. Address,

NATIONAL MEDICINE CO.,
Premium Dept. 134 J, New Haven, Conn.

FEEDS AND FEEDING

NEXT WINTER it will be necessary for our farmers to study the question of stock foods. Corn, the great stock grain, will be high in price, and substitutes must be provided for it. How can these substitutes be found? Only by comparing other and cheaper foods with corn, and knowing beforehand how they will affect the animal. This comparison may be done by studying analyses, but a farmer cannot afford to spend the Winter in experimenting. He must know beforehand what others have found out. He can learn this by studying Prof. W. A. Henry's great book. Feeds and Feeding tells you just what you ought to know about foods and how to feed them. It is full and complete, and easy to read. Price, $2.

Sold by THE RURAL NEW-YORKER, NEW YORK.

PROF. W. A. HENRY'S GREAT BOOK.

AMERICAN POMOLOGICAL SOCIETY.

The Convention at Buffalo.

PART I.

The convention was opened by an address by President C. L. Watrous, of Des Moines, Iowa. He gave a brief history of the Society and spoke of the great progress which has been made in 50 years, in methods of conducting meetings, and in exhibits, nomenclature, etc. Since the organization of the American Pomological Society, a great revolution has been made by the use of better implements for the culture of fruits, and controlling insect pests. Prof. Macoun, of Ottawa, Canada, next discussed orchard renovation. He said that the best work at the Ottawa Experiment Station has been testing varieties, and finding the ones best adapted to our climate. They are also sowing clover in their orchards—the common Red clover—early in the season; this makes a cover crop the next Winter. The following Spring, it is plowed under to add humus and make plant food for the trees. We are now practicing pruning and spraying to a greater extent, and with satisfactory results. He advised spraying trees with lime as a protection from Oyster-shell bark-louse.

Prof. L. R. Taft, of the Michigan Agricultural College, followed in the discussion of the same subject. He advocated spraying, pruning and fertilizing as the means of renovating orchards. He recommended wood ashes applied to the soil, as a remedy for the Woolly aphis. Prof. Corbin applies tobacco dust, six feet from the trunk of the tree, making a circle, with good effect. Prof. Alwood, of Virginia, observed good effect from scraping the trees with a hoe as far as one can reach, before spraying with lime for Oyster-shell bark-louse.

Prof. Craig, of Cornell University, spoke of college extension work. He said the amount of farm products has been multiplied by 20 in 50 years, and the labor to produce it has only been multiplied by four. This progress will bring the trend of population back to the farm, if we make the farm work attractive and interesting. This is the work undertaken by the university extension college course—to bring education and inspiration to the young people on the farm who cannot go to the university. The correspondence course in agriculture is reaching thousands. In four years, the people reading the course have increased over 25,000. Reading clubs are being formed in all parts of the country, and the work is made easier in this way.

Charles W. Garfield, of Michigan, read a paper on Quality and the Market. The thought of the paper was catering to the markets, so as to suit demands of individual tastes, learn what the market demands, and supply it. Many people are willing to pay well, if they can get what they want. Fruits are planted, because they are hardy and productive, without giving due attention to quality. The consumption of fruit could be largely increased, if you can give them something that is good to eat. The poor fruit remains too long on the table of the hotel-keeper, and because more is not eaten, the consumption is not larger. Prof. F. A. Waugh, of Vermont, discussed the same subject. He said that the main qualification by which to judge fruit, is its table quality, if you wish to reach a private market. The public needs to be educated to recognize quality. This market may be enlarged. First we need quality in the man, then we can get better fruit.

Prof. L. H. Bailey, of Ithaca, N. Y., gave an address on Some Contrasts of the Pomology of the Atlantic and the Pacific Coasts. He found commercialism in fruit growing on the increase on the Pacific coast. He found fruit growing newer and more provincial, with the idea that theirs is the only region in the United States adapted to it. The climate of California is distinguished by its rainfall. The rainfall is conserved by the most thorough system of tillage. In one year it is less than 30 inches. The very large fruits are grown only where irrigation is practiced. The climate is salubrious for those who are constituted to enjoy it, but to many eastern people, it would be too monotonous. The man is the most happy who believes that the place where he lives is the best in the world. There are fewer high-bred types of fruits and flowers than in the East. Large areas and wholesale methods are practiced. If you like the eastern climate, and especially, if you have small means, do not go west. Your opportunities are better in the east. Successful growing is not so much a matter of soil and climate, as a matter of men. Fruit growers are better organized in California, which is an advantage in marketing. He can control railroad and commission rates. Western competition is going to force us into special lines of fruit growing. R. R. Morrill, of Michigan, spoke of the value of dust mulch in the orchard in times of drought. The cheapest irrigation is what has been called "horse-leg" irrigation. Speaking of renovating orchards he said that the best way is first to renovate the men who own them. L. B. Pierce, of Ohio, said that only a small quantity of fruits can be marketed at the time when they are in best condition for eating. Ripe fruit cannot be kept, when ripe, to ship. Prof. Webster, of Ohio, concluded the afternoon session with a paper on Some Experiences in Orchard Spraying and the Results. He said that very much depended on the manner of spraying or applying the mixtures. Few men can be hired to do the work in a way that gives good results. A man needs special training for the work. In every instance spraying orchards has proved profitable when well done. W. H. J.

REPORTS FROM POTATO GROWERS.

Potatoes are one-fourth crop; worth 75 cents. Two months of hot, dry weather caused the trouble with the potato crop.

St. Charles, Minn. R. E. M.

The crop is is almost an entire failure. There is nothing to rot. The early varieties are best so far. The late ones are almost nothing. D. R. A.

Green Valley, Minn.

Late potatoes are a very light crop, almost a failure. Early ones about one-half to two-thirds of a crop in our neighborhood. Our nearest market is Indianapolis; carloads about $1.05 on track; $1.20 from store; retail at $1.40 to $1.60. W. H. F.

Greenwood, Ind.

The heavy rains which came in July drowned out about one-quarter of the crop. I judge the yield will be about 60 per cent if the frost holds off 20 days. Potatoes are now (September 17) just in blossom. There seems to be no rotting at present. E. L. L.

Bancroft, Mich.

I cannot give you a definite answer at this writing about the late crop, as none is dug yet, but the majority of the crop as it stands looks very poor. There is once in a while a good piece of potatoes, but they are failing to put on many tubers. There have been many acres entirely eaten up by the bugs. Early potatoes have not been a half crop in this section. I should not estimate the late crop to be over 50 bushels to the acre, and a short acreage at that. We have not been troubled with any rot yet. M. O. F.

Ada, Mich.

The potato crop in Jersey Co., Ill., is a total failure. We do not know of a farmer who has raised enough to serve him until next crop. A few have had enough for immediate use, but we have heard numbers of them say that they planted more seed than they raised potatoes. We are at present selling Northern stock for $1.60, but prices will be lower later, we think. Last year farmers had more potatoes than they could use, and we had no trouble in buying plenty for our trade. Usually we get a car from the North. Oats a total failure. Hay crop very short. Early planted corn will make from five to 20 bushels. Later planted will yield 20 to 40 bushels. Blackberries, strawberries and raspberries a small crop. Most of them dried on the bushes. Orchards are very much damaged by flat-headed borers. Peach and apple crops good. Extra fine wheat yield, and all grades No. 2. E.

Grafton, Ill.

Cut and Shredded.

PENNSYLVANIA FARMS.—In my idea the farm land of Butler and Sugarloaf valleys is worth more. Of course, some farms are about the same, but take the farm of the alive man, and it exceeds 20 years ago by at least one-third. The surrounding towns are rapidly increasing; consequently making a better sale for the product of the farm. Farms are in more ready sale to-day than 20 years ago. It seems that doctors, lawyers, merchants and coal operators are taking more interest in them, and going back for a country home.

Drums, Pa. S. R.

THIS season has been a very curious one. Oats were a failure, and potatoes, the early ones, were in the same boat with the oats. Late potatoes, like Chas. Downing and American Wonder, are looking very fine as far as vines go, and I think there will be a fair crop. Corn is not as good as usual, but will be very good, considering the season. Buckwheat is well filled, the Japan better than the Little Grey. Apples are a light crop. I had a postal to-night from a firm in Boston that I have shipped to, saying that they were selling for $2.50 to $4 per barrel, but it is not time to pick Winter apples yet here. G. W. H.

Columbia Co., N. Y.

THIS has been an ideal Autumn so far, with just enough rain to make corn ear well; rather dry for potatoes, with no signs of frost as yet, September 6. Corn is good; Mecosta County never had better. It has eared the best I ever saw it. Cutting has commenced. Wheat did not turn out as well as it promised; the insect did some damage and the dry weather in June caused some shrunken kernels; oats a failure, about one-half crop. Apples one-third crop, and nearly all wormy; too wet to spray last Spring. Beans are a good crop; they are taking the place of potatoes here. Potatoes are about two-thirds of the usual acreage, and one-half of them eaten up with bugs. We are bugging them yet, something I have never done before at this time of year. Rye was about three-fourths of usual yield; is selling at 50 cents per bushel.

Mecosta Co., Mich. W. B.

MARKET NOTES

DECEPTIVE PACKAGES.—Retail buyers are often disgusted to find in peach or other fruit baskets a false bottom stuffed with paper. The ingenuity displayed by those who fix up these fake packages is remarkable. The Chicago Sealer of Weights and Measures is making war on these frauds, and heavy fines are imposed on those found guilty. A favorite scheme is to twist a lot of cornucopias of stiff paper, into each of which a peach is set, rosiest side up, one layer filling a basket which should contain twice as many peaches.

GAME ILLEGALLY STORED.—Last Spring reference was made to the fact that the State Game Warden had seized a large quantity of game held out of season in a cold storage house in this city. The case is to be tried in October; and, if the full penalty allowed by the law should be inflicted, the fines would amount to $1,197,000. Game laws are of no account unless enforced, and certainly wholesale violators are not entitled to any more consideration than the man who shoots one bird out of season. It is to be hoped that this test case may clear up matters that have been somewhat obscure, and put all who catch or handle game on the same basis.

FRUIT NOTES.—Peaches are very plentiful. Jersey and other nearby stock is coming in rapidly, and there is a large quantity that are small and inferior. Many are half covered with rusty green spots, which give them an uninviting appearance. Some of these sell as low as 25 cents per 16-quart basket. The western peaches that are coming in bushel baskets are also inferior. Plums are scarce this week. On account of the large receipts of under-grade apples, the market for anything except fancy is weak. Watermelons, while the best of the season, are selling low, as the weather is too cool for any great demand.

INVOLUNTARY FIRE CALL.—Probably one of the strangest false alarms ever sent in to the fire department was given recently in the heart of the wholesale grocery district in this city. A heavy truck struck and upset a post containing a fire alarm box. The electrical apparatus being so violently stirred up started into business at once, and in a short time five fire engines and several hose trucks and hook and ladder trucks were on hand. It is a finable offense to send in a false fire alarm, but in this case no one seemed to be to blame unless perhaps the city authorities for permitting an alarm box to be placed where it could be upset by a truck.

EXPORT NOTES.—During the eight months ending August 31, 1901, there were shipped from all ports of the United States 122,521,206 bushels of wheat, 91,017,144 of corn, 22,337,645 of oats, and 12,716,867 barrels of flour. The total value of all breadstuffs exported was $192,860,604, and of other provisions $150,590,779. Gulf and other southern ports have been successful in diverting to those points considerable of the western export wheat formerly shipped from New York. During August, 1901, New Orleans shipped 500,000 bushels more than New York, and Baltimore the surprising quantity of 6,715,174 bushels, more than twice New York's shipments for that period. Other ports in order of quantity shipped were Galveston, Philadelphia, Boston, Chicago, Newport News, Duluth, and from Pacific coast points Willamette and San Francisco.

MARKET TERMS.—A reader wishes an explanation of some of the abbreviations and technical terms used in market quotations. In speaking of fruit, d.-h. barrel means double head, to distinguish it from the open or cloth-covered barrel sometimes used. Checks are slightly cracked eggs. They are always cheap and, of course, have to be used at once. F. o. b. means that goods thus quoted are delivered free on board the cars or boat or whatever means of transportation may be used. Thus, if a man buys feed f. o. b. cars Jersey City, he would not have to pay for delivery from the mill to Jersey City, but would have to meet the freight charges from there to his station. Large lemons run about 300 to the box, and the smaller ones 360. Hence the quotations, fancy 300s or 360s. The same rule is applied to the better grades of pineapples, and thus we have 24s, 30s, 36s and 42s, referring to the number in the crate. The cheaper pines are numbered two, three, four, etc. Bananas are figured at the number of hands to the bunch, seven and eight being common sizes. The hands refer to the form in which they grow on the bunch, the single cluster and stem resembling the fingers and wrist of a hand. W. W. H.

Live Stock and Dairy

WHEAT BRAN OR MIDDLINGS.

Do Cows Need So Much Protein?

PART I.

At the suggestion of several readers in Connecticut we sent the following letter to Prof. T. L. Haecker, of Minnesota. His answer will doubtless interest many Eastern readers:

"Some of our subscribers in Connecticut heard you talk on the dairy cow last year or the year before. Among other statements, they say that you advocated the use of coarse bran in the place of middlings. One man says he heard you say that you would not take middlings as a gift, or words to that effect. A vast quantity of middlings is fed to cows in Connecticut, and you have stirred these feeders up with your statements regarding bran. Will you tell us just why you consider bran so much better than middlings? If these men are wrong in feeding middlings, they want to know it."

What I said on the subject of feeding during my visit in Connecticut was based upon the generally accepted feeding standard suggested by the German scientists, though I have no recollection of making the statement quoted in your letter. We are fortunately learning something, and it is quite likely that if I were to speak to Connecticut farmers at any time in the future on the feeding problem, I would treat the subject differently. In all our agricultural literature bearing upon feeding, it is claimed that a cow needs daily at the rate of 2.5 pounds of digestible protein per 1,000 pounds live weight; that of this amount .7 pound is needed to support the body, and that the remainder is for the production of milk. Since the establishment of American experiment stations the feeding standard suggested by Dr. Wolff, a German scientist, has been in common use, and, indeed, has been the basis upon which advanced methods of feeding have rested.

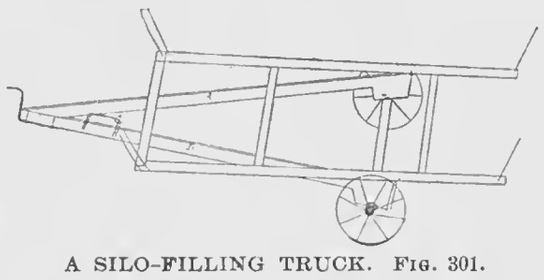
With a few exceptions, the dairy herd at the Minnesota Experiment Station has been fed on what is termed a balanced ration since its establishment, 10 years ago, and, judging from the results obtained in amount of milk and butter fat yielded by the cows, and the cost of production, the balanced ration was followed by a far greater return than was obtained by haphazard methods of feeding. During the Winter of 1894-'95 several feeding experiments were carried on, which happened to cause a deviation from the feeding standards. The first instance was in the Autumn of 1894, when the grain ration for the dairy herd was ground wheat only. This was followed by an experiment covering 84 days, comparing ground barley and corn with ground wheat; and then followed another covering 70 days, comparing Timothy with prairie hay. This last experiment closed April 21, or only two weeks before the cows were turned out to pasture. While there was no real definite information obtained in comparing the different foodstuffs, incidentally some very valuable data was obtained bearing upon the protein requirements of dairy cows. This data and that obtained from the herd during the last Winter is published in Bulletin No. 71, just issued from the dairy division of the Station. The data included all work done in 286 days, and show that the cows at the Station need less protein than is claimed in the feeding standards. To show the daily consumption of protein by each cow, the yield of milk, its average of butter fat, and the average yield of butter, we present the following table, which is for the last period, or 70 days, ending April 21, 1895. The figures represent pounds and decimal of a pound:

Cow.	Protein daily.	Milk daily.	Per cent fat.	Butter fat.
Beckley	1.68	13.17	5.6	.736
Countess	2.40	41.80	2.5	1.061
Houston	2.14	24.88	5.4	1.340
Lou	2.21	31.46	3.7	1.154
Olive	1.67	21.20	4.1	.884
Reddy	1.69	14.49	5.2	.755
Belle	1.76	19.38	4.1	.808
Lydia	2.26	27.98	3.6	.999
Quidee	1.85	25.81	3.5	.902
Sweet B.	2.21	26.09	5.3	1.379
Topsy	2.59	40.82	3.7	1.492
Tricksey	1.56	15.73	5.3	.840
Average	2.00	25.23	4.1	1.029

The table shows that there was only one cow in the herd that used as much as 2.5 pounds of protein daily, that one received 1.56 pounds, that the herd received an average of two pounds, and yielded daily a little over 25 pounds of milk and one pound of butter fat.

A SILO FILLING TRUCK.

Several years ago I built a silo, and to obviate so much labor loading the corn in the field, I built a truck after my own ideas, one that I think serves the purpose as well and better than any I ever saw, for several reasons. First, it is low, being only 26 inches from the ground to the top of the skids that carry the load; second, it cost very little, is strong, and will last until the axle wears out. The two pieces, A and B, are 3x6 oak, about 14 feet long, 12 inches wide where they rest on the axle. The axle and wheels are an Osborne binder truck. The pieces are beveled on the inside at the front, so they fit together nicely, and bolted together with two half-inch bolts. A piece of four-inch tire is then used. Split one end 12



A SILO-FILLING TRUCK. FIG. 301.

inches back, open the two pieces until they fit under the two pieces A and B, and punch two holes in each piece of iron to bolt under the end of A and B. Then bend iron up and forward, leaving upright portion 12 inches, and forward long enough to go over axle tree of wagon, same as forward end of coupling pole works, and punch hole for body bolt to pass through. This iron should be one inch thick, as it carries more than half the weight of load. Put an eye bolt in back end of A and B, and hook in each skid, so the load may be dumped if necessary. Skids are 3x6 oak also, and 12 feet long, with three or four pieces framed in to keep them on their edge, and also furnish rests for three or four boards which should run lengthwise to serve as a bottom to prevent corn falling through.

In back end of skids bore inch holes, and put in three-quarter-inch iron rods three feet long for standards. Nail two pieces of six-inch board on in front to serve same purpose. The back ends of pieces A and B are fastened to truck by ⅝-inch bolt passing down through, and nut underneath. C is a piece of iron ⅝x 1½ inch, bent and bolted to A or B for slide-bar of wagon to work through, to hold up the tongue. This truck can be used behind the front wheels of any wagon, and coupled or uncoupled as readily as the hind wheels. To dump load, tie the two ends of a rope to the back ends of skids, before loading begins. Lay each rope along bottom of wagon to front, and make fast while loading. To dump, carry the double of rope back over load and fasten to a rope or chain that must be tied to a post or stake in the ground. When tied drive team up and let skids dump. Put your double rope back on skids, and go for another load while that one is being cut. A load is about one ton. H. S.

Glendale, Md.

DORSET SHEEP AND DOGS.

The pugnacity of the Dorset depends altogether upon the object. I do not find them cross or quarrelsome toward men, women or children, nor do they fight much among themselves. A lot of rams turned together will fight a few battles until they have settled among themselves the question of precedence, and after that they will live peaceably, whereas Merinos, I think, never cease their battles. The fighting of dogs is rather more a characteristic of the Dorset ewe than of the ram, and no doubt she is emboldened to defend her offspring by the fact that nature has provided her with weapons, and that with her two little horns she can strike quite an effective blow. I think perhaps this warlike spirit comes from her exceedingly strong maternal instincts, these instincts being stronger perhaps among Dorsets than among any other sheep. Yet it is true that they will make a bold stand against dogs when they have no lambs with them at all. The Dorset is not "dog-proof," and I have known of a number of instances of their being killed by dogs; rather I should say I have read of such instances. In our own experience our Dorsets, living among hundreds of worthless curs (I live near a darky settlement) have never suffered the least damage from dogs, although now and then a sheep has disappeared bodily from the pastures. I think the truth is, that if a sheep will stand and make a show of fight the dogs are too cowardly to attack, although in the case of old sheep-killers, I cannot doubt that they would destroy even Dorset sheep.

Eight years ago I was first attracted to the Dorset sheep by the claims then made that they were "dog-proof," and I did not then dare to stock the farm with any other kind of sheep. I was so anxious for the "dog-proof" qualities that I would have been willing to have taken sheep if they had had almost no other good attributes, but the more I have become acquainted with the Dorsets the more prominent the other good qualities have become, and the less I think of their "dog-proofness," although I still consider that a very important point. I have never observed any battles among the ewes, although sometimes one will bunt another two or three times for fun. But I have observed that it is not a good plan to have yearling ewes running in the barn with older ewes and their little lambs, for if the little lamb should get in the way of the yearlings, especially about the racks or troughs, it might get a knock that would cripple it. I have not known older ewes to hurt the little things, but the yearlings are as yet unacquainted with maternal solicitations.

JOSEPH E. WING.

Horse Owners Should Use
GOMBAULT'S
Caustic Balsam
The Great French Veterinary Remedy.
A SAFE, SPEEDY AND POSITIVE CURE.

Prepared exclusively by J. E. Gombault ex-Veterinary Surgeon to the French Government Stud

SUPERSEDES ALL CAUTERY OR FIRING

Impossible to produce any scar or blemish. The safest best Blister ever used. Takes the place of all liniments for mild or severe action. Removes all Bunches or Blemishes from Horses or Cattle

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, Etc., it is invaluable.

WE GUARANTEE that one tablespoonful of CAUSTIC BALSAM will produce more actual results than a whole bottle of any liniment or spavin cure mixture ever made.

Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

Bought at Receivers' Sale. Sheets either flat, corrugated or "V" crimped. No tools except a hatchet or hammer is needed to lay the roofing. We furnish free with each order enough paint to cover and nails to lay. Price per square, $1.75
A square means 100 square ft. Write for Free Catalogue No. 57 on General Merchandise. Chicago House Wrecking Co., West 35th and Iron Sts., Chicago, Ill.

SOME SEPARATOR QUESTIONS.

How much cream (by measure) will a separator take from one gallon of new milk? What ought the cream to sell for when the whole milk sells at six cents per quart? How long does it take to separate the cream from eight to 10 gallons of milk? What sized separator would be required for 10 gallons of milk at a milking? What would the size required cost, and what make would you recommend? T. S. G.

Wilsonburg, W. Va.

The amount of cream will depend upon its fat content. We shall have to guess, as one has to in most cases where questions are so indefinite. Assuming that the milk contains four per cent fat, and the cream contains 25 per cent fat, 100 pounds of milk, or 46 quarts, will make 16 pounds of cream or about eight quarts. Test your whole milk and find out how many pounds of fat, then reduce it to the desired consistency, and measure it. If for butter making, I would not run less than 30 per cent fat, and even a richer cream is desirable. If for commercial purposes then the buyer will fix the standard. There are no laws controlling the fat content of cream; it is simply a question to be settled by the buyer and seller. When four per cent milk sells for six cents a quart a pound of fat is worth 70 cents, placing our figures on a basis of 100 pounds of milk, which would be worth at six cents a quart $2.80. If 25 per cent cream is made we should have as previously mentioned eight quarts, worth $2.80, or 35 ents a quart. Understand, however, that these figures may not represent to the owner a full net comparative value, because at six cents a quart milk must be retailed, and the whole product is gone, while in cream the labor of selling may be reduced and the skim-milk remains to offset the expense or separating and cost of machinery. As a rule, the cream trade is a very satisfactory one, because the skim-milk can be kept at home.

Hand separators are made to handle from 250 to 1,000 pounds of milk per hour. The question calls for 100 pounds. The cost of these machines will be from $65 to $200, according to size and kind. I shall not advise the purchase of any make, because several of the standard machines work well in the hand sizes. My experience has been with De Laval, of the power sizes. A bit of general advice is all that is wise to give in purchasing a separator. Be sure that you are guaranteed close skimming, as low as .05; that is the first essential. Next, get a guarantee that 40 per cent cream can be made if necessary, and secure close skimming; then buy the machine that will cost the least money. I do not mean cheap goods; get quality always first, but get it as cheap as possible. Secure some cheap power to turn it if any quantity is to be run. See that the machine is run according to directions; kept oiled, and always well balanced. Much unnecessary trouble with hand separators is from lack of a good foundation; run by some one who has no mechanical ability trouble follows. Let me add that a Babcock test is a necessary adjunct to a separator. Know surely what the result is at least once a week, and if butter is made it will serve a double purpose in testing buttermilk.

H. E. COOK.

SHREDDED VS. CUT SILAGE.

Having had no experience with shredded silage, I have no information on this subject. I see no reason why shredded fodder should not keep as well as the unshredded. I should also suppose that animals would tend to eat more of the shredded than of the unshredded fodder, since the coarser parts of the stalks would be better fined, and mixed with the more palatable parts.

I. P. ROBERTS.

Cornell Exp. Station.

It is only where one has a shredder and is without the cutter that it would be desirable to use it in filling silos. Shredded corn at the right stage of maturity for filling silos will keep satisfactorily under ordinary conditions, but not better than when cut in the ordinary way. So far as I have been able to learn, the quality of the silage is not materially affected by the method of cutting. But where the silos are shallow, and especially if the corn is a little dry, the packing of the silage from the shredded corn is not likely to be quite as close as when cut short with the ordinary silage cutter. Some shredder heads which are used on combined machines simply split the stalks, leaving them in quite long pieces, and where this is the case cattle do not eat the material quite as closely as when cut in the ordinary way. Of course more power is required to run the shredder than the cutter when that is in good condition. F. H. KING.

Wisconsin Exp. Station.

We have used a shredder in a general way at the Indiana Station a great deal for about seven years. So far as shredding dry stalks is concerned, the process has been entirely satisfactory, and the stock has seemed to eat the shredded forage more completely than the cut. The former is also more easily handled in our experience. On two different years we filled the silo with shredded green corn. One year it was put in a square, and another in a round silo. In neither case did the silage keep satisfactorily. Moldy spots were common through it, and there was much waste. This silage was each year tramped and spread uniformly level while filling. Yet the loss was too great to be permitted in profitable management. I do not wish, however, to condemn shredding for the silo. Occasionally I have learned of persons who shred, and with great success. I do think it, however, most desirable to have a silo of considerable depth, with very tight or close sides, and a minimum exposure to air. I further believe, as based on experience, that corn cannot be shredded into the silo with the success that attends cutting, using like care in storing. The shredded will retain much more air than the cut, and will not pack so closely as that which is cut. The shredded silage, however, should be preferable to the cut, if well preserved. As to whether there is any difference in the feeding value of cut and shredded silage, so far as I am aware no experiments have been reported in this direction. I should not look for any material difference, and do not believe there would be.

C. S. PLUMB.

FAT HENS AHD EGGS.

There will probably be some hens that will get too fat to lay well fed on a balanced ration, while others will lay well. I think one will always find some poor or indifferent layers in all flocks. A hen fed entirely on corn until too fat to lay would no doubt lay if changed to a balanced ration, but would better be starved a little for a few days to make her hunt for something to eat, which would give exercise, and that is what they all need. I think corn part of the time a good grain for hens even if they do get a little fat on it. Who ever saw a poor hen lay? Of course some breeds put on fat more readily than others. I do not think that it would do to feed Light Brahmas all the corn they would eat, as they would get "lazy" and fat, and sit around waiting for more corn. An excellent feed for Light Brahmas part of the time is wheat in the straw; they will hustle around to get the grain, and lay right along. Another breed that I find takes on fat readily is Plymouth Rocks, while White Wyandottes will keep in good condition and shell out eggs with a feed of lots of corn. The Leghorns and Minorcas, with unlimited range, could be fed almost wholly on corn, and would do well and lay nearly all of the time. D. A. MOUNT.

I have always thought that pullets properly cared for and fed on well-balanced rations would usually commence laying before getting too fat. Yearling hens, especially Asiatics, have a tendency to take on fat, but that can be easily controlled by feeding less hearty food. J. RANKIN.

Value of Corn Ears and Stalks.

1. Will 600 ears of green corn fatten hogs as well as 600 ripe cured ears? 2. If a shock of cornstalks 18 x 18 sells for 10 cents, can one buy more good corn fertilizer for 10 cents than the rotted stalks will bring? B. J. N.

Elmo, Ky.

1. No. The water in corn has no real feeding value, consequently the greener it is the less valuable it is compared with dry corn. It is the *dry matter* in corn that furnishes nutriment, and this dry matter contains protein or muscle-making or lean meat food, and carbohydrates and fat, which so largely assist in creating fat in the body. One could not tell what the feeding value of the 600 ears would be, unless chemical analysis was made, or a feeding trial made. 2. Just what weight a shock consisting of 18 hills square will be depends altogether on the number of stalks per hill, the variety, general richness of soil, season, etc. In the Middle West such a shock would weigh about 500 pounds, and would contain in the form of corn stover about five pounds of nitrogen, 1½ pound of phosphoric acid, and seven pounds of potash. If one had to buy this as fertilizer it would cost in the vicinity of $1. So you can easily see that when one sells that amount of cornstalks at 10 cents he is pursuing a rather expensive policy. He would better be a buyer than a seller. Of course of 500 pounds of stalks, not all of it would find its way back to the soil under ordinary conditions, but enough of it would to make it important to save the stuff rather than sell at such a low price. C. S. P.

Shotes Wanted in Canada.

On page 585, issue of August 24, in notes from Indiana by E. H. C., may be read: "Three months ago everyone was hunting shotes at from five to six cents. A sow and pigs sold at fabulous prices. Now the trouble is to find a place for shotes. It is quite possible that it would be a blessing if every pig one has could die before morning." Here in central Ontario on September 6 the condition is just the reverse; abundance of feed but a scarcity of pigs. Farmers here would be very glad to get some of the pigs that Indiana has to spare. You would be doing both parties a good turn by making the facts more widely known, and thus open the way for the one to get rid of the shotes he does not know what to do with at a good price, and for the other to obtain the shotes that he needs to convert his abundant supply of feed into pork. The corn crop here will be extra one. Then, too, there is a quantity of barley that was damaged by the rain at harvest time that must be utilized as feed. Light hogs are quoted here at $6.75 per 100. W. O. E.

Whitby, Ont.

Two Good Black Hogs.

I claim that the Berkshire hog is the best forager in existence, feeding on almost all kinds of grass and weeds that any other animal will eat. He is kind in disposition, easily managed, fattens rapidly on corn or ground feed at any age; grows to the age of two to three years, so he can be fed to await the pleasure of seller. Carries more loin steak than any other hog and more lean ham, as when fat is trimmed off outside, the remainder is lean, where in the Poland Chinas flesh is intermixed with both lean and fat. He is the best hog with home cattle. For the Poland China, he is very docile, needs but little room, requires but little fence; fattens at any age, and the best hog to keep in small inclosures; has great digestive powers, condensing all kind of food into nice marbled pork. They are the two best breeds of hogs on this green earth; both handsome, uniform in color, make and finish, and they give the owner a good return for his feed and labor. V. B. HOWEY.

Topeka, Kan.

A chronic, "tearing" Cough, can be so alleviated that it will be scarcely felt, while the way is being paved for a perfect cure with Dr. D Jayne's Expectorant.—*Adv*

NAGGSBY: "The loss of his wife dro him crazy." Mrs. Naggsby: "How you know?" Naggsby: "He's marr again."—Judge.

"WE never remember the faces those we love most dearly." "That's To save me I can't tell what a hundred dollar bill looks like."—Detroit Free Press.

TWYNN: "Poor Rickett's death resulted from his fondness for tobacco." Triplett: "I heard that he was killed by an explosion." Twynn: "Well, he opened a keg of powder with a lighted cigar in his mouth."—Melbourne Leader.

"BY jing, if I'd 'a' knowed the girls would 'a' played all the time this way I'd 'a' got an organ instead of a piano." "But I thought you didn't like organ music." "No more I don't, but an organ has a few stops to it."—Baltimore American.

"YOU," said the angry customer to the clerk, "said this cloth was fast color, and it faded out within two weeks after it was made up." "Well, madam," replied the clerk, "I don't think you ought to have expected it to fade any faster than that."—Pittsburg Chronicle-Telegraph.

WILLIE (aged five): "Papa, didn't you tell me that if I took care of my pennies my dollars would take care of themselves?" Papa: "Yes, my son." Willie: "Then, why didn't your dollars take care of themselves the other day when you lost your pocketbook?"—Chicago Journel.

SQUIRE JONES: "I suppose you farmers are greatly benefited by the seeds that are distributed by the Department of Agriculture?" Farmer Harrow: "They are all right as far as they go, but why in time don't the Government send out weedless seeds if it wants to help the farmers?"—Boston Transcript.

PAPA: "Didn't I tell you, Willie, if I caught you playing with Tommy Jink again I would whip you?" Willie: "Yes, sir." Papa: "Then why were you playing with him?" Willie: "Well, I got lonesomer than I thought a lickin' would hurt, so I just went over and played with him, that's why."—Detroit Free Press.

FARMER KRICK: "Henry writes for more money; says he wants to take fencin' lessons." Mrs. Krick: "Well, fer goodness sake, send it to him, Hiram! It's the fust useful thing he's wanted to study sence he went to college. When he comes home ye kin jes' set him to work puttin' a new fence in front o' the house."—Judge.

FOR every purpose where White Lead is required, that made by the "*old Dutch process*" of slow corrosion is the best, because of its superior density, its uniformity and durability.

The brands named in margin are genuine "*old Dutch process*" White Lead, the best it is possible to manufacture, and which have long been recognized as standards of paint value.

For any color or shade required, use NATIONAL LEAD COMPANY'S Pure White Lead Tinting Colors. Pamphlet sent free upon application.

National Lead Co., 100 William Street, New York.

"The Story of a Free Rural Delivery Mail Box."
That is the title of an illustrated and descriptive booklet setting forth the merits and superiority of our

Uncle Sam's Favorite Mail Box
It's the one, and the only one approved by the Government that is made entirely of steel. There is only one seam in the entire box. Thoroughly riveted together—no solder. Stamped from steel plates and formed to shape. Has letter holder and change holder for use when you are out of stamps. Lid is held down by spring. Can't blow open. Rain, snow or sleet cannot blow in. The Government requires the use of an approved mail box on all free delivery routes. Ours is approved by the Government. Sample box with your name on, sent express paid, for $2.00. Liberal discount in quantities. We also furnish steel posts to fasten box on. We furnish the Government all the posts for city boxes. Write at once for illustrated booklet. We mail it free.
Bond Steel Post Co., Adrian, Mich.

AN ACRE OF CORN
and its possibilities under the Silage system—being the theme of
"A BOOK ON SILAGE"
By Prof. F. W. WOLL
of the University of Wisconsin. Revised and up-to-date, neatly bound into a volume of 234 pages. It embraces full information from planting to feeding the crop, and includes working plans and specifications for building all silos. Also embraces:
I—Silage Crops. II—Silos.
III—Silage. IV—Feeding of Silage.
V—Comparison of Silage and other Feeds.
VI—The Silo in Modern Agriculture.
And illustrations and complete plans for round and rectangular silos, dairy barns, tables of compounded rations, etc. Mailed for 10c. coin or stamps.

OCT 5 1901

THE GOOD OF A GRANGE.

DIRECT AND INDIRECT BENEFIT.

Money Saved and Moral Sentiment Gathered.

"What is the good of a Grange anyhow?" This was said to me by a neighbor a few years ago, when I asked him to join the Grange. And this is what THE R. N.-Y. wants to know; what good the Order has done, and is now doing both to the farmers and their families who belong to it, and to the farming community in general. Now, "the good of a Grange" is made manifest in two ways; in the financial benefits and in the general uplifting of the farmers and their families in educational, social and moral lines. And as the farmers are really the breakers between the trusts and corporations on one hand and the mob on the other, or in other words, between capital and labor, the farmer representing both, anything that elevates the farmer helps the whole country. As to the money saved by the Grange, the insurance is generally thought to be the largest saving. In a county with a large membership like Monroe, N. Y., the insurance only costs us 50 cents for $100 for five years and $1 to the director who writes the policy. The Monroe County Patrons' Fire Insurance Association has made but three small assessments in its lifetime of nearly 25 years, has always paid all losses promptly, and is stronger to-day than ever. The State Grange makes arrangements with houses in the different cities of the State by which we can obtain a discount on almost anything we want to buy for cash, and as to selling our produce we can correspond with Granges in other sections who might need something we have to sell. This part of the subject has not been worked up as much as it deserves to be, and no doubt will be in the future.

The Grange years ago broke down the price of farming tools, etc., when it was booming in 1873, 1874 and 1875. Then came a dull time with the Order, but for the last 10 years it has made a steady growth both in numbers and influence. So much for the direct money benefits, but the greatest good the Order is doing to-day is in instilling a love for farming and country life into the minds of boys and girls and young farmers. I have always said that the man who sees nothing in farming but the money he can get out of it, has no real love for farming, and will in the long run not get as much money out of it as the one who loves farming and country life with such a deep and abiding love that no bad seasons or low prices will ever be an inducement to leave the farm for a more lucrative pursuit. This is just what the regular meetings of the Grange do, by bringing together, twice a month generally, the old and young, boys and girls, farmers and their wives, to hold a short conference in the business of their lives. Our own particular troubles seem lighter when we hear what our brothers and sisters have to say about their failure. While we all need the Grange meetings, the women and boys and girls need them even more than we do. It breaks up the routine and monotony of their lives, and gives them an outlook over a larger world.

This has been the great objection to farming, its isolation and loneliness. But the true farmer feels more lonely in the crowd and tumult of a great city than in his own quiet fields if he has any sympathy with Nature in her various moods. It is impossible to imagine how many young farmers have been led to read and think from what they learned in the Grange; to improve their farms, to study the habits of weeds and insects, and how to subdue them. Discussions on religion and politics are not allowed, but temperance has always been advocated in our meetings; in fact, it is the best temperance society I know. But, says a practical farmer: "What do you do in your meetings, anyway?" Well, we take in new members and initiate them as fast as we can. In a new Grange this takes a good deal of time. We receive valuable information from State and National Granges, which the secretary or lecturer reads. We sometimes correspond with other Granges East or West. Last Fall our Grange (Wheatland Grange No. 890) ordered the secretary to get the addresses of secretaries of western Granges, and get information regarding the apple crop. They very kindly responded. The result was our members held their apples a while, and received more for them. Then the question box gives those who do not feel like speaking a chance to get any subject discussed that they are interested in. If we should fall short of business (which we never do) we could have the lecturer read one of the many bright and up-to-date articles from THE R. N.-Y. The truth is that we do not have time enough in the Summer evenings to do all we would like to do in our Grange. In the Winter we hold the meetings afternoons, and take more time.

THE DAILY "SEWING CIRCLE" AT HOPE FARM. FIG. 302.

Caledonia, N. Y. S. W. COX.

R. N.-Y.—Another thing about the Grange is the fact that it educates farmers in the theory of organization. Wherever there is a good Grange you will find the people working and thinking together, and always along helpful lines. The farm institute managers know that wherever there is a good Grange they are sure to have a good institute. The organization helps advertise the meeting, and the farmers have formed the habit of getting together for consultation. So, too, with the work of the experiment station and agricultural college. Wherever there is a live Grange, boys go to the college, and there is a large circulation of farm literature. All these things have an indirect bearing upon farm education and contentment. The Grange has also been of great service to the older men and women on the farm. Many farmers' wives, past the days of youth, "with lives broken on the hard wheel of labor," have found in the Grange opportunities for mental and social pleasures which were denied them by any other social organization.

FACTS ABOUT GRAPE JUICE

HOW IT SHOULD BE PREPARED.

For Home Use or for Sale.

During the past few years the business of preparing and selling grape juice has assumed large proportions. We have had so many questions about it that the following notes from an experienced vineyardist are printed:

How to Prepare the Juice.

Some of the correspondents desire information for domestic use and others for commercial ends. I would impress on the reader that the two are distinct, and the domestic method cannot be developed into the commercial with profit. This is an age when the household cannot compete with the well-equipped factory—at least in most things. Sixteen cents per gallon for juice gives a fair price for our Concord grapes. There is a wide difference between that price and 50 cents for a quart bottle with a fancy label. The expense involved from the press to the druggist's counter is more than the inexperienced will likely credit. The manager of a concern having an investment of at least $50,000, and a number of years of experience, tells me that the price of bottles is a greater factor in his profits than is the price of grapes. This statement may be surprising to us who have bottles under foot and consider them rubbish. As with some other things the selling is more than the manufacturing. Theoretically, there are large profits in the business, and no doubt the long-established and well-managed concerns find good compensation on the investment, but the inexperienced person should count 10 before entering the commercial class.

I unreservedly urge the preparation of grape juice for home use. The principles for preservation are essentially the same as for canning fruit. The greatest variation is the temperature. Fruit is often brought to boiling point before sealing. This would give grape juice a "cooked" flavor. A temperature of 175 to 180 degrees is as much as can be given. Keep the juice at this point long enough to heat the whole evenly.

In making wine, culls and partially rotted grapes can be used for the reason that the wine can be "doctored." Any "doctoring" of grape juice will impair its flavor, and therefore only good and well-ripened grapes should be used. With us in the Chautauqua grape belt Concord is the variety commonly taken. Pick the fruit from the stems and crush into a pulp. Heat the pulp from 175 to 180 degrees. If one wishes the clearest juice regardless of economy of grapes, let the juice drain from the pulp. If one wishes the greatest amount of juice regardless of quality, squeeze the pulp. Be certain that the juice is of above temperature before sealing the bottles or fruit jars. Fill so the juice will come as near as possible to the cork. Dead air space may contain germs that will cause fermentation. Cover the cork with wax. Jugs, if well glazed, may sometimes do, but glass is more certain.

Commercial establishments use large glass flasks or carboys for storage until ready to place the juice on the market, at which time the juice is siphoned from storage to the size of bottles required by the trade. The juice is reheated, and the canning process repeated. The market requires the juice to be as clear as possible. The sediment is the alloy. The siphon permits the clear juice to be drawn off without disturbing the muddy "settlings." This second bottling is not strictly necessary for domestic use, provided

small packages are used. Like canned fruit, juice will not keep long after being opened. The sediment can be largely retained in the bottle if carefully poured. Pressed pulp gives more sediment than drained pulp. JOHN W. SPENCER.

Chautauqua Co., N. Y.

Grape Juice for Vinegar.

Will juice from ripe grapes make good pickling vinegar? If so, please give process. How long will it take to make it? L. L.

Broad Ripple, Ind.

Grape juice will make vinegar. Speaking in a broad way, I would say that all grapes raised east of the Rocky Mountains contain a small amount of sugar as compared with the grapes of Europe or the Pacific coast. To promote development of acetic acid about 10 pounds of cheap sugar would better be added to a 50-gallon cask of grape juice. Give exposure to air by open bung and with same temperature development will be similar to cider vinegar. The color of grape juice vinegar is very attractive for table use. It is very strong and will bear some dilution. It contains some free tartaric acid, which makes pickles soft. I know of no way of elimination available to the average farmer. This tartaric acid is one of the sources of supply of cream of tartar used in baking.

J. W. S.

Hauling Juice for Wine.

I have a vineyard eight miles from town. Will the wine be affected by extracting the grape juice on the farm and hauling in barrels to the city before fermenting? Will several (two or more) kinds of grapes make as good wine mixed as if kept separate? G. H. K.

Knoxville, Tenn.

G. H. K. can haul his grape juice the eight miles with no probable interference with later fermentation. In answer to the second question I would say that I am not an expert in wine making. If I were I should feel obliged to ask the gentleman to go with me out back of the church under the horse sheds where I could whisper the little I know. I should do this out of deference to the strong temperance views of the senior editor of the R. N.-Y. Yes, *some* kinds of grape juice can be mixed to advantage in quality of the wine but not *all* kinds. Experts call it "marrying." Makers of champagne and past masters in wine making claim to have it down very fine. It is a kind of matrimony of which I know only by hearsay. J. W. S.

The Business Side of It.

I would like information from some one who knows about the manufacture of sweet grape juice (unfermented wine). The size of plant required to use two to four tons of grapes per day, expenses for help, expense of bottles, method of keeping the juice, etc. J. T. M.

Forestville, N. Y.

I would advise you to visit the establishments of Gerey Reckman, Brocton, N. Y.; the Fenner Grape Juice Company and the Welsh Grape Juice Company, Westfield, N. Y., and the Gleason Company and F. N. Randall, Ripley, N. Y. You will find that some of the above companies have investments of over $50,000 in plant and stock. I think you will find that selling is more than manufacturing. Unless you have ample capital and good executive ability, you will be like a village wagon-maker in competition with a wagon factory. You may think there is a big margin between a gallon of grape juice at 12 cents and 14 cents, which would make a fair price for our grapes, and 40 cents for a quart bottle as is paid when passed over the counter of a drug store. So there is, and no doubt some one finds the business profitable, but is is a question if a novice would find it so during the first year, and perhaps not the second in the business. I doubt if any of our present day manufactures can be adequately described by pages of information that will lead to profitable results without personal experience. The above establishments are 15 to 22 miles from your home, and a visit to them will give you more live information than a volume of THE R. N.-Y. If I wished to engage in the business I would either spend a year in the employ of one of the most successful firms, or go into partnership with some reliable man who had. J. W. S.

A WORM THAT "HAS WORMS."

I send a worm that I picked from my tomatoes; it is covered with some kind of moth. Will you explain what it is? F. K.

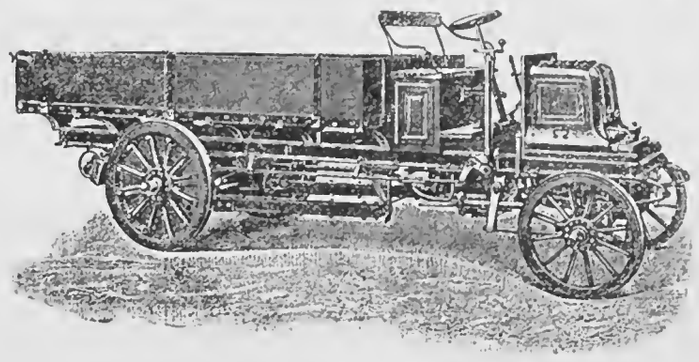
Bates, N. Y.

Although we told the story of one of these worms that "have worms" in THE R. N.-Y. several years ago, as it is an interesting story that all ought to know, and as we succeeded in getting the fine picture, shown in Fig. 303, of the specimen sent in by F. K., for these reasons we will briefly repeat the story, and hope the picture will help to impress it on the reader's mind: The caterpillar is one of those large, formidable-looking but perfectly harmless green Tomato worms. It looks as though it had been rolled in rice which had been coated with glue, and the kernels had adhered to its back. Naturally these caterpillars have a sickly gait, and well they may. These white objects projecting from the skin of the caterpillar are not eggs or seeds, as some have supposed; but each one is a cocoon within which there will be found a white maggot developing into a tiny four-winged fly!

How did the cocoons get into such a curious position? It happened in this way: When the caterpillar was about half grown, one of these minute flies espied it and, hovering over it, darted down upon it, and at each dart, inserted a minute egg through the skin of the worm. Each little fly is supplied with 100

A WORM THAT "HAS WORMS." FIG. 303.

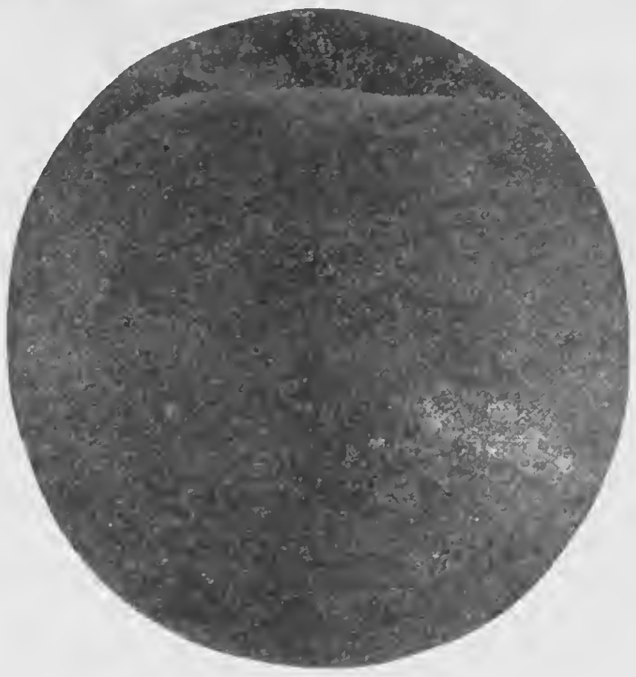
or more eggs, and usually she does not stop until the poor, defenseless worm has received nearly the whole stock. The worm doubtless wriggles as each egg is pricked through the skin, but it can do nothing to prevent the deadly work. In a short time these tiny eggs hatch into white maggots, which thrive and grow fat at the expense of their host that is all the time eating ravenously. And how can the poor worm grow much with 100 or more greedy little mouths



A FARM AUTOMOBILE. FIG. 304.

at work within its body, absorbing the food as fast as it is assimilated?

Right here comes in one of those mysterious things in nature that we so frequently meet among insects. The little maggots working inside the body of the caterpillar, understand perfectly well that, if they should attack a vital organ, their host would die, and consequently their food supply would be cut off. Hence, the maggots or parasites feed entirely and



THE NEW PEACH, MISS LOLA. FIG. 305.
See Ruralisms, Page 678.

only on the juices and fatty tissues of the body, allowing the vital functions of their host to go on undisturbed until his death. In every case, the parasitic maggots get full grown before the caterpillar has become so weakened that death ensues. The full-grown maggots then work their way through the skin on the back of their host, and at once spin around themselves the white cocoons. It is a very interesting operation to watch one of these parasites spinning its cocoon about itself. The cocoon finished, the parasite transforms within through a pupa stage to the minute fly, like its parent, which laid the eggs in the worm. When the fly has become fully formed, and is ready to escape from the cocoon, it deftly cuts around the upper end of the cocoon, and then pushes off the end, which opens like a little door, usually hinged at one side. The caterpillar usually lives but a short time after the parasites emerge from the cocoons. It is a curious sight to see one of these worms walking about with these cocoons attached to its back, as shown in Fig. 303, and one should never destroy such an afflicted worm, for it is carrying latent destruction for many more caterpillars. Nearly 150 of the parasitic flies have been found on a single Tomato worm, and it seems strange that the parasites do not check the pest to a greater extent than they do. Perhaps they, in turn, have their enemies. Such things often happen in the insect world.

M. V. SLINGERLAND.

AUTOMOBILES FOR FARM WORK.

The London Market Gardener gives a description of what it calls a "petrol lorry," which has been used for hauling farm crops to market. A picture of this vehicle is shown at Fig. 304. This machine does the work of six horses and will carry a load weighing 4,500 pounds. On one occasion this machine carried two tons of tomatoes 16 miles to market, leaving home at three o'clock. This load was taken off, then the machine ran home and hauled a second load and reached home after 64 miles of travel as soon as the horse wagons, which left the farm at eight the previous evening and made only one trip. The actual cost of fuel for these two trips was 75 cents.

The machine shown at Fig. 304 is 17 feet long, four feet nine inches wide, with a space available for loading of 11x6 feet. A steel frame can be used which will carry three tons if desired. It ran 16 miles, carrying 2½ tons in 2½ hours, part of the journey being up hills which required an extra horse on the wagons. The engine uses petroleum for fuel, and 10 gallons will run the loaded machine about 100 miles. The owner of this machine thinks that it will prove a great help to farmers in reducing freight and express rates for short distances. In one case he carried a load of 280 baskets of grapes to market at a total cost of $3.75. The regular railroad rate for the same distance was 12 cents a basket! It is quite likely that where the roads are smooth and the grades easy such machines will surely compete with the railroads successfully. In this country the roads are not all suitable for such machines, but near the large cities they could doubtless be run so as to carry farm products quickly to market. The French and the English are ahead of us in this respect, but it will not be long before Americans will take the automobile away from the city, and put it at work upon the country roads.

TRAPS FOR THE HESSIAN FLY.

On page 611 was printed a letter from S. W. Wadhams, of Niagara Co., N. Y., in which he gave his experience in sowing "trap crops" of wheat to attract the Hessian fly. We feel sure that our readers will be glad to know what Mr. Wadhams is doing this year, and so we print the following letter from him—dated September 14:

I am using the trap strip again this year, and the object lesson, that the farmers in this neighborhood had from my experiment on last year's crop, has so convinced them that they sowed their trap strips and are very willing to follow the suggestions of the experiment stations. We sowed two widths of the drill all around a 22-acre field, and two widths across the middle of the field August 20. The wheat is now four inches high, and is being rapidly covered with the eggs of the fly, which are plainly discernable under a glass. I find that some of the eggs are evidently being destroyed by some parasite. I also find that the eggs are being laid on oats sown as a cover crop following the early potato crop, and I believe it will pay to plow them under the same as the trap strips. We shall sow our regular crop October 1, and plow the trap strips under just before the last sowing appears above the ground. I emphasize plowing, since some of my neighbors have the idea that cultivating the trap strip up and resowing will answer the purpose. I do not agree with them, for I know that it is very essential thoroughly to bury the young plants, covered as they are with the eggs of the fly.

We shall resow the trap strip, using a forcing fertilizer, as we found by experience last year that it was equally as good as the rest of the field. We are giving the wheatfield very thorough shallow cultivation, thus giving us a compact seed bed with mellow surface conditions, and shall use a high-grade wheat fertilizer in connection with a top-dressing of barnyard manure spread with the Kemp manure spreader, thoroughly cultivated in. As I intimated in my letter to Prof. Roberts, we shall plow the trap strip under at night, believing that by so doing we shall be able to destroy millions of the fly that will be still laying eggs at that time. From my observation and experience I am led to believe that no wheat is fly proof, but some is more resistant than others, on ac-

count of stiff hard straw, but as a general thing these are of an inferior milling quality, and therefore undesirable. We shall sow No. 6 the same as last year, as there is a great demand for it by the shredded wheat biscuit manufacturers as well as for general milling purposes. I practice heavy fertilizing, but do not believe that we can push the wheat out of reach of the fly, since one of the most complete failures in this neighborhood followed a heavy top-dressing of manure and a heavy application of phosphate.

Monroe Co., N. Y. S. W. WADHAMS.

FARMING IN SOUTHWESTERN NEW JERSEY

Fertilizers to Start Stock Farming.

PART II.

Last week I mentioned briefly the system of farming followed on the home farm of Mr. I. J. Blackwell. Here we have land that for nearly 60 years has been well cared for. Such a farm will carry many head of stock, and, since only fruit, meat and wool are really removed from it, and, besides the hay and grain, both fertilizers and feed are added, it is comparatively easy to keep up the rotation. In order to carry out a definite rotation successfully the soil of a farm must be even and in good heart.

But what of a farm that has not been well cared for? What can be done with it? Mr. Blackwell has another farm of 107 acres, with about 12 acres taken up by timber and brook, which has begun to answer this question. By common consent this farm was "so poor that crows would fly over it." That expresses just about the depth of agricultural poverty. Two former tenants had failed to make expenses. Mr. Blackwell says that this farm represents a cost of $3,500, while the highest offer he could get for it was $1,500. Here as elsewhere the value of farm land was reckoned on the basis of the products it would turn off. As the chief farm products of this section are meat, milk or wool, when this farm failed to produce grass and grain its value ran down.

What can be done with a farm in a stock country which will not produce stock food? In such sections the argument is that live stock will increase the fertility of the land, but farm animals restore land only through what they eat, and this farm could offer them nothing. Should manure be hauled from other farms? No, for it was needed at home. Few farmers ever think it wise to haul manure from one farm to another. Should grain and fodder be hauled from outside and fed on the farm? That might be done, but it would be a slow and expensive way of restoring a farm under a tenant system.

Mr. Blackwell decided to start at once with fertilizers, believing that in this way he could quickly increase the amount of grain and fodder and thus work this poor farm into a profitable rotation. So he began at once with the Mapes fertilizers on wheat, grass and corn. The old sod was plowed and fair dressings of the fertilizer used. The farm was too wet in places to raise good crops, and considerable draining has been done. In starting the acreage of corn was large—that is, more of it was planted than there will be after a full rotation can be carried out. That was wise, because corn gives more stock fodder in one season than any other plant in the rotation, and also does well on sod with a fair dressing of fertilizer. This year's crops cannot be given yet, but last year's statement was about as follows:

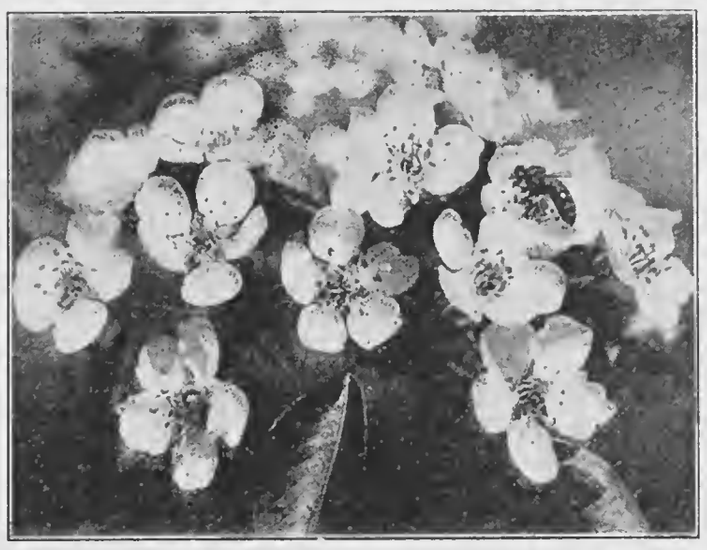
200	bushels of	wheat	$130
800	"	" corn	400
600	"	" oats	150
	Total		$680

In addition to this grain, there were about 30 tons of hay, while the stalks from the corn gave an immense amount of fodder. This was only the second year of using fertilizers, and it must be remembered that two years before the tenant was told that he would surely starve. It will take two years more to complete the rotation—that is, get fully over the farm with clover and chemicals. Each year increases the production of straw, grain and grass. All this is fed to stock, so that each year the number of animals will be increased and still more manure put on the corn.

Of course the rotation has not yet been fully worked out, but enough has been done to show the possibilities of this plan of restoring run-down land by means of fertilizers. Few potatoes are grown here, but the great object is to increase the crops of stock food, for when a farm can carry its full force of stock and all their manure is well saved and used the question of farm fertility is pretty well settled. On his home farm, which has for years carried its full share of stock, Mr. Blackwell still finds that it pays him to use fertilizers on the wheat and oats. He says that even after years of good tillage, and manuring he can always tell, in the wheatfield, where the fertilizer was shut off. The story of this poor farm is a striking one, showing as it does that there are conditions under which a bag of fertilizer may be made to grow into a manure pile. In this case the fertilizer was cheaper, quicker and more effective than purchased grain and fodder would have been, and I have no doubt there are many places where much the same methods could be followed to advantage. H. W. C.

GASOLINE ENGINE FOR USE ON THE FARM.

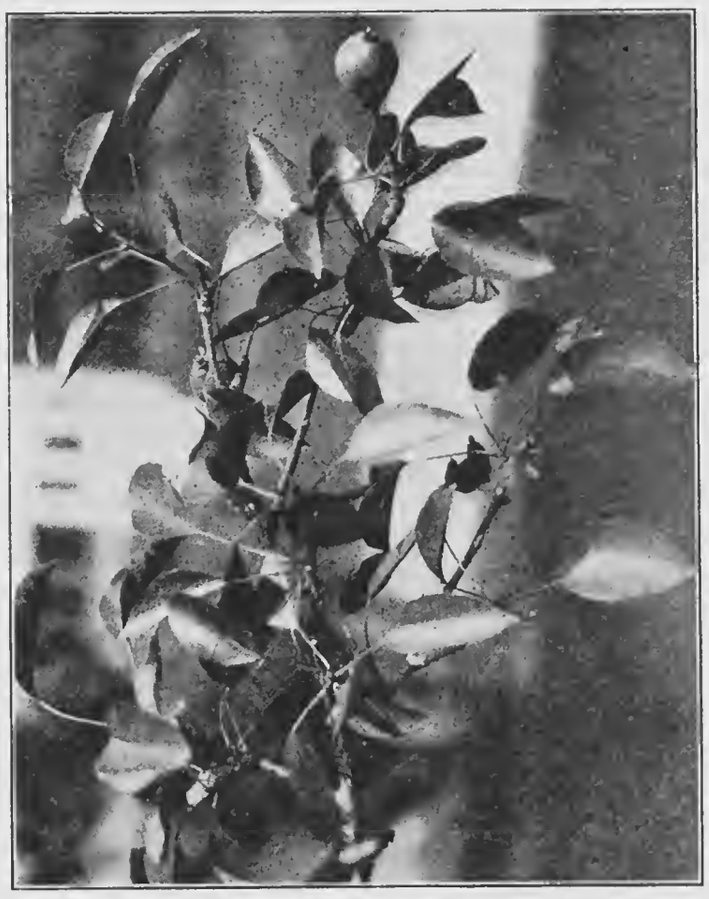
The question of power is ever a very important one on the farm, when it has not been solved satisfactorily. We all need mills to grind our feed, together with corn shredders, feed cutters and the like, and to operate them successfully we need a good



THE EARLY SPRING PROMISE. FIG. 306.

power. Horse power, be it tread or sweep, will not answer all purposes, neither is it the most economical power. It may do for a corn crusher, when the farmer's time doesn't count for much, or when he does his own work, but when labor is employed and there is considerable work to be done, we need something that will push the work along rapidly.

On the farm steam power is not what is wanted. Unless one is an expert engineer, it is very dangerous to operate, and to buy fuel and hire an expert every time we want to operate machinery makes it expensive. Then it is not a convenient power in Winter, for boilers must be filled and emptied every time the engine is started, and in spite of everything pipes are freezing and bursting, and something is out of order nearly every time we want to run. Machinery that is heavy enough to turn off work expeditiously can't be run economically with horse power. The farmer needs an engine or power equal at least to six horses, if he would have his work done satisfactorily. After an experience of 20 years with most all kinds of powers we can say that nothing equals the gasoline engine for convenience, economy and expedition of work. We have had a six horse-power engine in use for five years. It is always ready for work, and can be started in two minutes when needed. We knew nothing at all about this kind of engine when it was



HOW THE PROMISE FAILED. FIG. 307.

See Page 677.

bought, but with the printed directions for operating and keeping engine in repair we have run it up to this time without a cent out for repairs. We frequently hear it said that a gasoline engine is a complex machine, and liable to get out of repair, and this may be true of some makes for aught we know, but this has not been our experience. We operate it at an expense of a little less than 10 cents an hour. The fuel to run a steam engine will cost considerably more than this, to say nothing about an expert to operate it. We run corn crushers, bone grinders, fodder shredders and feed cutters at all times of the year, and our engine has never failed to do its duty, when the battery was in good condition. It costs about $4 a year to renew the battery, but we have had batteries to last a year and a half.

We wouldn't advise anyone to buy less than a six horse-power engine, and always have it mounted on trucks. You frequently need to shift it around from place to place in the barn, or from one barn to another. In almost any neighborhood the farmer can make good wages shredding fodder or running machinery for his neighbors. In fact, if we were so minded we could operate our engine in this way a good portion of the year. When a farmer doesn't feel able to buy an engine himself, he can usually find some of his neighbors who are willing to join with him and use it together. It is quite convenient to have heavy machinery in partnership, as a few farmers living close together can help each other in handling crops, and save a considerable outlay of money, which the larger farmer pays out when he owns and operates his own machinery. Farmers are beginning to realize what the corn fodder crop is worth when it is properly handled early in the season, but it is rather expensive to hire outfits, as they go about through the country, to do the work. The only remedy we know of is combination, and when power is needed secure a gasoline engine. It is no longer an experiment, and you run no risk in putting your money in one. W. W. STEVENS.

Indiana.

SKIM-MILK AND LIME PAINT.

One of the chief methods for improving the appearance of buildings, is by painting, which is expensive, and soon fades. It costs quite a sum to cover buildings with two coats of lead and oil, when planed boards are used, and is beyond the poor man's means when buildings are old and rough boarded. The worst of it is that paint is not durable. A few years ago I paid about $60 for patent prepared paints, and in two years but little remained on the house. A painter acquaintance told me the trouble was with the paint, and advised the use of lead and oil, to be mixed at home. The best white lead I could get was bought, a supply of oil obtained, and a first-class painter secured. Then my troubles began, for the painter insisted on mixing small quantities at a time, claiming it should be put on soon after mixing. Three-quarters of his time was spent mixing paint, and no two batches were exactly alike in color or texture, but then it was all "hand painted"; nothing cheap about it, and I dared not complain, for painters are too scarce to take any back talk. The space covered with paint each day was but little larger than the bill for the work. This preparation has lasted better than prepared paint, but cost enough more to make up the difference, and after a few years begins to show considerable wear.

This experience clearly demonstrated the fact that a poor farmer could not afford to keep barn and hen houses of unplaned boards painted with such paints, and I was induced to try "government whitewash," which nearly every paper in the country has given a free advertisement. It made a paint easily put on, and came off as easily as it went on. It cost quite a good deal for material, required some time to make it, and was money thrown away, as it did not last a year. It covered up everything it was put on, leaving the surface so white and dazzling that the glare hurt the eye, and no defect could be seen for the short time it remained. I imagine it is the kind used in investigations, and derived its name from that source.

Thirty years ago a building was painted with skim-milk and stone lime and looked quite well—traces of that mixture still remain, and the boards have been well protected. In the Spring of 1900 I used a milk and lime mixture which is wearing well, and is very cheap in both material and time required in putting on. We used sweet skim-milk, water lime colored with yellow ocher, using Venetian red for the doors. The mixture must not be too thick with lime, for it will form a crust, instead of penetrating, which will crumble off after a freeze or a hard jar. When right it will show the grain of the wood through it and cannot be rubbed or scraped off. There is too little of it to crack off, and a pretty shade of color is obtained by using the ocher. The shade can be varied to suit the taste, and to secure uniformity a large quantity should be mixed at one time, using a large tub or barrel to mix in. Measuring both milk and lime also aids in getting satisfactory results. The durability does not seem to be affected by the amount of rubbing in given, and where we used an old half-worn broom it seems to stay as well as where we spent more time, with ordinary paint brushes. It looks a little smoother on close inspection, but not enough 10 feet away to pay for extra time required. I would use brushes four to six inches wide, and slap it on lively, keeping the contents of the pail well stirred, as some of the lime will settle to the bottom.

Compared with other paints, this mixture, which really looks well, costs so little one could afford to put on a coat each year, but I think from present appearance it will last many years. The effect of a straw-colored building with red doors, as seen through the green of the plum trees, is pleasing, and as this mixture sticks to any old board it can be used on fences, hen parks, and small buildings, at a very slight expense. There are none so poor they cannot afford to paint and beautify their premises with this mixture. The color should be added to avoid monotony, and is more pleasing than the universal white buildings and fences of Delaware, or the red barns and white windows of central New York. Do not put it off, thinking it a big job, for it is easily and quickly mixed, and a man can paint a large building in one day. The entire cost of painting a good-sized barn need not exceed $5. C. E. CHAPMAN.

Farmers' Club.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Connections for Lightning Rods.

J. D., Stanton, N. J.—In putting lightning rods on buildings, is it necessary to have more than one ground connection to each rod?

ANS.—One good ground connection is all that is needed, but it should go down to permanent moisture. Many good systems are rendered ineffectual by grounding in dry, non-conducting soil.

Lime Wash for Borers.

W. W. S., Hightstown, N. J.—A friend has heard that the application of a hot thick wash of lime to the infested parts of a peach tree will kill the borer. He is informed that such a wash is successfully used in Maryland. Does any reader know of the success of such application?

ANS.—Such a lime wash would probably destroy any small borers and eggs with which it might come in contact, but could have little effect on those buried in the wood. The knife is about the only cure for infested trees, but lime and gas tar washes are useful as preventives.

An Old Soldier and a Pension.

E. W., Lanoka, N. J.—Can you tell me how to apply for a pension? I have an old man helping me who served in the Civil War. He was drafted at the close of the war, was in the last engagements, doing active service over a year, and was honorably discharged. Now through misfortunes he has lost his papers. Is there not an official record kept of the soldiers serving in the war, their names, honorable discharge, etc., and where shall I make application for the same?

ANS.—We wrote to the War Department and find that, in order to secure a certificate to take the place of lost papers, a blank furnished by the Department must be filled out, signed and attested and sent to the Chief of Record and Pension Office, War Department, Washington, D. C. The certificate will then probably be made out, and then application for the pension itself must be made to the Commissioner of Pensions, Washington, D. C.

Covering Bush Fruits in Cold Countries.

T. E. B., Whitewood, S. D.—I would like a little information in regard to Winter covering for dewberries. I covered mine two Winters with earth; in the Spring they came out bright, but in about 10 days I would find them dead, almost to the ground. Last Winter I left them without cover, and as usual have no berries. I have a strong healthy growth this year, and would like to save them if possible. Our Winters are mild and dry. What snow falls, until near Spring, blows into holes and low places, so that the ground is bare most of the Winter. The mercury seldom falls lower than 20 below zero, and then for a short time only. Fruit is scarce and high in this country and we like to save all we can.

ANS.—A thick soil covering is considered most effectual, and is in common use in northern blackberry plantations. A covering of hay or straw, held down by brush, might save the berries, but dry winds and a temperature of 20 degrees below zero are too searching for most cultivated members of the Rubus family. We should try covering with earth again, covering the whole with straw and brush.

Small Shoots of Asparagus.

A. L. J., Chateauguay Basin, Canada.—An asparagus field that did not cut its average this past season, has lately sent out young green shoots among the dark green growth. It is very noticeable, and some one remarked that it was a "sign of weakness." Is that so? It may be injured by frost before maturing. What is the best to be done for such a field? It was slightly rusted last year.

ANS.—Without some knowledge of previous conditions it is considerable guesswork to answer. If we reason from the normal growth of asparagus, which throws up shoots in late June quite large if allowed to grow, then smaller in July, and in the last August growth about the same, only fewer, it would indicate that a suspension of July normal growth had taken place from some cause, and the late August growth of small shoots was excessive. But as the rust is letting up this year, it may be from that cause. One thing is certain, that from whatever cause next year the bed will cut small shoots, as the growth is too late to perfect large buds for next year's cuttings; that requires a long growth of top.

New Jersey. E. BEEKMAN.

Copperas for Peach Trees.

J. M. R., Cornwall, N. Y.—Has copperas any specific chemical action that would lead you to think it useful to peach trees attacked by yellows? Early last Spring I applied eight pounds to each of two peach trees that were very sick with this trouble, and mixed it with the earth by a shallow hoeing. I also poured several pails of liquid manure from stable around them. Within six weeks the trees looked green and healthy. Was it the copperas or the liquid that worked the cure? If in your judgment it was copperas, would it be effective in the apparently similar disease that attacks raspberry vines? I have lately applied copperas to two young peach trees; I have omitted fertilizer. Still, the result, if failure, may be due to application at wrong season and therefor not conclusive.

ANS.—It is not likely that the copperas, which is simply sulphate of iron, had any effect in restoring the vigor of your peach trees. Many cases of supposed peach yellows are simply starvation of the tree from lack of food supply within reach of its roots. The liquid manure you supplied and the subsequent cultivation are sufficient cause for the improvement noted. Possibly an abundant feeding or manuring would have a similar beneficial effect on your raspberries. The application of the copperas might in the end be beneficial to the trees by supplying iron in the soil, though its immediate effect might be supposed to be injurious to the young rootlets.

Holding Peach Trees Over Winter.

J. L. H., Crosswicks, N. J.—Will some one tell me the best way to care for young peach trees the Fall and Winter previous to planting them, and why it would not be just as well to let them stand in nursery rows until planting time, especially if they were planted early?

ANS.—Unless the coming Winter may be very severe, I think peach trees almost anywhere in New Jersey would be just as well or better off standing in the nursery row, where they now are, than dug up this Fall and stored until Spring. I have often treated them both ways with good success, and in Kansas I found it the safer plan to dig them up in the Fall and bury them root and branch in moist earth until early Spring, when the time came for planting. It is a common practice now for nurserymen to put trees in storage houses over Winter, which enables them to get at the trees earlier in the Spring than it would often be wise to disturb them in the open ground, because of its very wet or frozen condition. H. E. V. D.

The Uplands of Virginia.

W. P. S., Grove, Va.—Would it be a profitable venture to plant an orchard of peaches, pears and apples on the "uplands" of the peninsula of Virginia? Which one of the three fruits named would pay best?

ANS.—By the "uplands of the peninsula of Virginia" I do not know what is meant, as there are only two counties of that State on the lower end of the Chesapeake peninsula, which lies just north of Cape Charles and between the Atlantic Ocean and Chesapeake Bay. The highest ground anywhere in this part of Virginia is only 43 feet above sea level, and I hardly think it would be proper to call any part of such a flat country "uplands." As I have repeatedly been all over this region I may say that many kinds of fruit do well there, but not so well in a general way as farther west, and especially in the fruit hills of the Blue Ridge country. However, there are a few small apple orchards there, and some of peaches and pears, which are doing quite well, and, I think, orchards of these fruits might be made to pay. I think of the three fruits mentioned the apple would pay the best because Spring frosts are quite common there, and the peach and pear crops are more likely to be cut off from that cause. H. E. V. D.

The Vermont Beauty Pear.

L. C. S., Garrettsville, O.—Can you tell me anything about the pear called Vermont Beauty? I have quite a collection of pears, including Wilder, Clapp's Favorite, Bartlett, Flemish Beauty, Howell, Anjou, Angoulême, Lawrence, Kieffer and Idaho, the last named blights badly. Am favorably impressed with the description of Vermont Beauty, but I do not want any kinds that blight easily. Any information in regard to this or the prevention of rot in plums will be gratefully received.

ANS.—Vermont Beauty is one of the newer pears. It seems to be well liked so far as it has been tried. It is of medium size, yellow with a very handsome red cheek, and of very good quality. It ripens in the Fall when pears are usually very plentiful, but it may find a place either for market or family use, and possibly for both. It is not accused, so far as I know, of being especially affected by blight. The Idaho is so bad in this respect as to be practically worthless, although the pear itself is very good. As to rot in plums; this can be in a large degree prevented by spraying in the early part of the season, and up to the time the fruits get about full grown, with Bordeaux Mixture.

H. E. V. D.

Peaches; Use of Potash.

C. B., Berkeley, N. J.—1. Is the Willett peach a good bearer? Is there any good yellow peach one week or so later than the Late Crawford? 2. When is the proper time to apply kainit to peach trees that have borne a good crop this year? The trees have grown well this year. They are about six years old.

ANS.—1. The Willett is a yellow, freestone peach of about the same size, color and general character as the Crawford Late, but is a week or 10 days later than that variety. I think it would perhaps answer the desired purpose. Chairs is another peach of the same character, except that it is only a few days later than Crawford. Where the two are planted together it seems to prove somewhat the better. 2. It matters very little what time of year kainit is applied to the soil of a peach orchard. As the potash which constitutes about 12 per cent of its weight is the valuable part, the rest being mostly common salt in a very crude form, the manurial part, that is the potash, will become dissolved in the course of time and will be a great benefit to the trees. However, I think muriate of potash is much better, because it contains about four times as much potash, and will not put the fruit grower to the necessity of handling so much salt, which, of course, is of no value whatever as a manure.

H. E. V. D.

I HAVE been very much interested in your published experiments on Alfalfa. There are large quantities of it raised here, yet few seem to realize the feeding value of it. I cut mine when in full bloom. Mow in the morning, rake in the afternoon and haul to barn on stack, from windrow, the following day, if weather permits. In a lower altitude, with greater humidity, it might have to stand longer before being stacked. Rain is delaying stacking and thrashing in this vicinity; something very unusual in this part of the country.

ROGERS ON THE HILL. THE ROGERS NURSERIES, Tree Breeders. Dansville, N. Y.

PROMISE AND FULFILLMENT.

What a beautiful sight a fruit tree in full bloom is! Each one of the thousands of blossoms is bright with promise of fruit to come. The busy hum of bees shows that they are eagerly carrying the pollen from flower to flower, thus doing their part to insure the fruitage. Why should not each flower fulfill the promise it now makes? Many mishaps may befall these flowers before they become fruit. In spite of the busy work of the bees many flowers fail to become pollinated and so quickly drop away. In the cluster shown at Fig. 306 every flower seems perfect. Bees came to visit them frequently, though not as often as to clusters higher in the tree. I have often noticed that the very nicest fruit is generally found at the top of the tree, but it never occurred to me before that one of the reasons may be because the bees did their work more thoroughly there. Experiments have shown that a liberal supply of pollen often adds to the quality of the fruit. Fig. 307 shows how much the promise has dwindled at midsummer, so much like our own promises and expectations oftentimes. Two little rusty pears are left, only one of which is on the immediate part photographed in flower. Even these are having a hard battle with the scab fungus, which has disfigured the surface and may ruin the fruit altogether, causing it to crack open or to fall before ripening.

It is interesting to draw down the branches of an apple tree in Summer and note the scars about the spurs, showing where blossoms were borne in the Spring. What tragedies are written there! Many dropped very soon; others persisted for a time, then succumbed to the attack of some insect or other enemy, while only a few remain. The story of their struggle is told by the size of the scars which are left. Only one out of many becomes a perfect fruit. The rate of mortality among children in cities is carefully watched. Whatever promises to reduce it is strongly urged and put into practice if possible. We might well inquire what can be done to reduce the mortality among the growing fruits upon the tree. One of the most important things is to encourage the bees. Imperfect pollination is probably the greatest source of loss with many kinds of fruit. Do not spray the trees while in bloom. This may kill the bees, and kill many of the flowers as well. It may even be wise to keep bees on the farm if there are few in the neighborhood. It is also wise to plant different varieties of the same fruit together. Many varieties do not set well unless they receive pollen from a different variety. This is well recognized among plums, pears, apples and grapes. I have found it equally true among bush fruits. Some varieties seem to thrive well alone, but many do not. Intermingling kinds which bloom at the same time will add much to the value of the work of the bees.

Plenty of plant food in the soil will also help to carry through a larger proportion of the fruits to a successful ripening period. To grow well they must be fed, either from food already stored up in the soil or from that applied. Not only must there be food in the soil, but grass and weeds must be kept from robbing it away from the tree. Good tillage is even more important than a liberal food supply. Many young fruits fall or fail to develop from lack of moisture. Thorough tillage will do much to obviate this. I read to-day how Roland Morrill, of Michigan, tilled his peach orchard during last year's drought, going over the whole of 100 acres every day, and finding that it paid. He added that under such tillage the "June drop," so commonly expected in peaches, cut no figure.

Some one will say that too many fruits often set anyway, and that to do these things which will add to the number is unwise. This is sometimes true, but it is not easy to control matters aright by allowing Nature to do her own thinning in this way. We cannot always foresee what the outcome is to be. The worst of the matter is that when Nature thins she weakens all the fruits in getting rid of part of them, so that the ones which remain are not in condition to improve their opportunities as they should do. Thinning fruit is expensive where it must be done by picking off individual fruits, but it permits the most perfect specimens to be left, and does away with the competition from excessive numbers and from those which can never make perfect fruits under any conditions. It is important that the thinning should be done before the fruits grow so large as to call heavily upon the available food supply. Nature cannot be depended upon to take them off at the right time.

FRED W. CARD.

EVERYBODY'S GARDEN.

UNSIGHTLY THINGS.—It is surprising how much rubbish and how many unsightly things have accumulated in and about the yard during the Summer. To rectify this, the girls, outside of school hours, are making themselves useful in gathering up the litter to be burned. The bonfires made of the trash largely compensate them for the labor, and we do not forget to teach them that there is also much satisfaction and pleasure in enjoying the better order of things. Then they assist in gathering the flower seeds as they mature, and help prepare them for use next year, and also in clearing the ground of matured stalks. Teaching them also to keep a sharp lookout for a place to plant either a useful or ornamental tree or shrub, is developing them along the lines of home beautifying and attractive surroundings.

WORK FOR THE BOYS AND GIRLS.—The work above referred to will, if carefully arranged, afford a very interesting and useful field for the boys and girls. It may be easily managed so as to be a pleasure rather than a drudgery, and we want every boy and girl reader of THE R. N.-Y. to start now and see what can be accomplished before the Winter begins. As you go over the yard or grounds, tidying up and clearing off the rubbish, look about to see where a nice flowering shrub or a forest or nut tree might be planted. A nice Sugar maple, elm, ash or basswood will greatly beautify some barren or unsightly spot; or a hickory, walnut or butternut tree will not only add beauty and shade, but by and by the nuts will follow, and usefulness as well as beauty will be the harvest of the future.

When the plans for planting are decided upon, the next thing will be the selection of the trees or shrubs. Nearly all varieties of shrubbery and ornamental trees, evergreens excepted, as also most of the nuts and fruit trees, barring the peach and apricot, may, if properly done, be planted in the Fall. As soon as the frost nips the leaves so that they fall readily, the trees or shrubs should be carefully taken up, removing all useless limbs and broken roots. The root pruning should be done with a sharp knife, cutting from the underside and outward, leaving a long clean-cut bevel. The holes should be dug large and deep enough to admit of filling in to some extent before setting in the tree with rich surface soil, setting the trees a little lower than when in the natural state. Bank up the soil around the trees sufficiently to prevent the water from settling around the roots, and a heavy mulch of well-rotted manure to protect from too severe freezing, will also be helpful. No disparagement to the Stringfellow method is intended, but the boys and girls are my special congregation this time, and doubtless the old methods will be safest for them.

This is in part the work which I want THE R. N.-Y. boys and girls to begin this Fall. Make the home dooryards just as clean and beautiful as possible, but do not stop at this. Appoint a meeting at the schoolhouse, and be sure to attend it. Clean up the school grounds and make them tidy and homelike. Set out some trees this Fall and plan for flowers and lots of them in the Spring. Make your schoolhouse and grounds attractive and beautiful and your teachers will surely appreciate it and assist you. Our country schoolhouses are towers of strength, so guard and cherish them sacredly, and when you hear talk of abandoning them and carting you off to the central school, sit down on it so hard that it will not be mentioned again in your hearing.

Hydrocyanic Acid Gas for Rats.

W. F. C., Turner Center, Me.—We have a poultry house, containing 1,750 cubic feet, thoroughly overrun with vermin. It was so when we came here, and we haven't been able to clear them out so far. Would not hydrocyanic gas do the work? Would the formula quoted by you in THE R. N.-Y. some time ago—one-fourth gram cyanide, three-eighths sulphuric acid and three-eighths water—be the proper proportions for such work?

ANS.—Our cats have cleared the rats and mice from the farm buildings. We think that several good cats fed only on skim-milk, and confined in that building for a while, would clean it. A ferret with a man who knows how to handle it would go down into the holes and drive the rats out. The hydrocyanic acid gas will kill any breathing thing that gets a whiff of the fumes. The rats must be induced to come up into the house in order to make this plan effective. Prof. W. G. Johnson tells of killing a large number of rats in an old smoke house. They placed the jar of acid and water in the house and hung the cyanide on a string over the jar so that it could be lowered from the outside. Then they threw corn inside the house and shut the door. The rats came out of their holes to eat the corn and, while a drove of them were fighting and squealing, the cyanide was lowered from the outside. In using this gas first find the cubic contents of the house or room. For each 200 feet one ounce of cyanide of potash is required. For every ounce of the cyanide use two ounces of water and 1½ ounce of sulphuric acid. For example, in the house mentioned, containing 1,750 cubic feet, you will need nine ounces of the cyanide. Put 18 ounces of water and 13½ ounces of sulphuric acid into a deep jar. Put this jar inside the room near the door. Wrap the cyanide in paper. Tie it to a string so that it will hang just over the jar and be sure to fall into it. Pass the string through a hole outside the house, so that it can be quietly let down. Throw corn or other food inside and shut the door. Night will probably be the best time for the job. Wait till the rats come out of their holes and then gently lower the package of cyanide into the jar. The gas will be instantly generated, and whatever breathes it will be killed. It would not be effective against the rats and mice to start the gas in the empty house, for it would not penetrate into the holes so as to kill the pests there.

Turnips for Green Manuring.

J. C. Q., Hickory Grove, Pa.—Some time ago I read an article in your paper stating that turnips plowed under for manure were superior to clover used for the same purpose, inasmuch that the turnip seed was surer to catch, and the crop was so much earlier to plow under than the clover. What is your opinion about it, and which is the best turnip seed to buy for the above purpose?

ANS.—Turnips will "catch" and grow on soil too poor to grow clover. They will make a quick growth and can be plowed under before rye seeding in the Fall. In no other respects are they superior to clover, and, unless you can use fertilizer of some sort with them, they will benefit the ground but little. Turnips as a green manure crop are at best only a makeshift and not to be considered where the clovers will grow. Our experience with the Cow-horn turnip this Fall is favorable.

NOT COD-LIVER OIL

but Scott's emulsion of cod-liver oil. They are not the same; far from it.

Scott's emulsion is cod-liver oil prepared for the stomach.

Let cod-liver oil alone if you need it. When your physician orders toast, do you breakfast on flour?

Pure cod-liver oil is hard to take and hard to digest. A man that can keep it down, can saw wood. He thinks he is sick; he is lazy.

We'll send you a little to try if you like.
SCOTT & BOWNE, 409 Pearl street, New York.

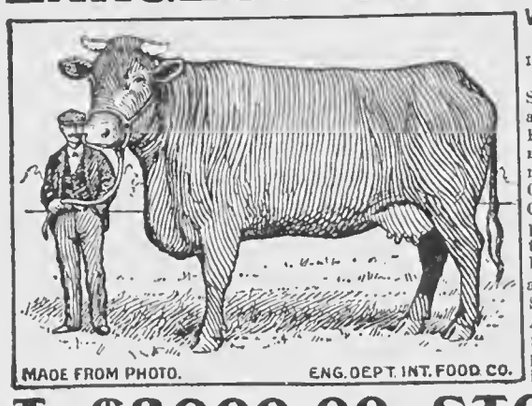
DIETZ Monarch Tubular Lantern
FOR KEROSENE

Is a standard size, handsome, handy, safe lantern and the one most farmers prefer for general runabout use. **Has a strong, simple but positive acting device for raising globe to light or trim, and will hold oil for 17 hours use.** Gives a strong, steady, copious light, and is absolutely safe from taking fire or exploding.

If not procurable of your dealer, we will send you one prepaid, safe delivery guaranteed, on receipt of $1. Write for our free catalog of lamps and lanterns.

R. E. DIETZ COMPANY, 87 Laight St., New York City.

LARGEST COW IN THE WORLD.



WEIGHT 2970 LBS. AGE 8 YEARS. SHORTHORN.

SHE EATS "INTERNATIONAL STOCK FOOD" EVERY DAY AND IS OWNED BY INTERNATIONAL FOOD CO., MINNEAPOLIS, MINN., U. S. A.

"INTERNATIONAL STOCK FOOD" causes Cattle, Horses, Sheep and Hogs to grow very rapidly and makes them Big, Fat and Healthy. Is used and strongly endorsed by over 500,000 Farmers. It is sold on a spot cash guarantee to refund your money in any case of failure by over 30,000 Dealers. It will make you extra money in Growing, Fattening or Milking. Owing to its blood purifying and stimulating tonic effects it Cures or prevents Disease. It is a safe vegetable medicinal preparation to be fed in small sized feeds in connection with the regular grain. It Fattens Stock in 30 to 60 days less time, because it aids digestion and assimilation. In this way it saves a large amount of grain. The use of "INTERNATIONAL STOCK FOOD" only costs 3 FEEDS for ONE CENT. Ask your dealer for "INTERNATIONAL STOCK FOOD" and refuse any of the many substitutes or imitations. It always pays to feed the best. "INTERNATIONAL STOCK FOOD" is endorsed by over 100 leading Farm Papers.

A $3000.00 STOCK BOOK FREE

MAILED TO EVERY READER OF THIS PAPER.

This Book Contains 183 Large Colored Engravings of Horses, Cattle, Sheep, Hogs, Poultry, etc., and of this Cow. It cost us $3000 to have our artists and engravers make them. It contains a finely illustrated Veterinary Department that will save you Hundreds of Dollars. Gives description and history of the breeds of Horses, Cattle, Sheep, Hogs and Poultry.

THIS BOOK FREE, Postage Prepaid, If You Write Us a Postal Card and Answer 3 Questions:

1st—Name this paper. 2nd—How many head of stock do you own? 3rd—Did you ever use "INTERNATIONAL STOCK FOOD" for Horses, Cattle, Sheep, Hogs, Colts, Calves, Lambs or Pigs. 3 FEEDS for ONE CENT.

The Editor of this Paper will tell you that you ought to have a copy of "INTERNATIONAL STOCK BOOK" for reference. The information is practical and right to the point and the book is Absolutely Free. We will give you $14 worth of "INTERNATIONAL STOCK FOOD" if book is not exactly as represented. Answer the 3 Questions and Write us at once for Book.

Largest Stock Food Factory in the World. Capital Paid in $300,000.00.

MINNEAPOLIS, MINN., U. S. A.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

WORTHY AMERICAN CANNAS.—The Canna thrives everywhere during warm weather, if given rich soil and plenty of moisture, but the floral effect is most brilliant in sheltered situations where the great trusses of bloom are measurably protected from brisk winds. Although extensively used for massive bedding effects about the breezy coast resorts, making a distant show of tropical luxuriance and glowing color unequaled by any other plant, one must go to some quiet place in the interior to find large masses of blooms in good condition throughout the day in average weather. The writer lately visited the Canna fields of the Conard & Jones Company, West Grove, Pa., for the purpose of comparing varieties. The Canna seems to find just what it needs in the clay loam soils covering the limestone slopes of this locality, and nowhere can more deeply tinted foliage nor livelier colors in the blooms be seen. Nearly eight acres are planted to Cannas, this splendid plant being an especial favorite with Antoine Wintzer, manager of the grounds, who has worked for years in the line of Canna improvement with a single-hearted interest very rare among horticultural originators. Seedlings and hybrids to the number of 20,000 and upwards are raised every year, and selections carefully made for future comparison. The practice is to inter-cross the finest varieties of diverse specific parentage, with the definite end in view of producing types specially adapted for American conditions. The range of color is being constantly extended and diversified, and the habit of growth and finish of bloom brought nearer perfection. The color effects of the immense blocks of favorite varieties was almost overwhelming in intensity, and made a startling contrast with the deep green of the surrounding woodlands. Among the many new varieties of special merit not yet disseminated are several with bright orange or scarlet flowers on deep mulberry foliage, the first dark-leaved Cannas we have seen bearing first-class blooms, a new white-flowered variety, very vigorous and profuse in bloom, and some very beautiful striped and flamed sorts of dwarf growth.

The following varieties, originated by Mr. Wintzer, are now in commerce, and have been repeatedly tested on the Rural Grounds. They are reliable and among the very best of their respective colors:

Pillar of Fire; six to seven feet; erect truss; early bloomer; brilliant scarlet.

Philadelphia; three to four feet, rich, shining intense crimson.

Duke of Marlborough; three to four feet, dark maroon crimson.

Black Prince; four to five feet, large, deep maroon.

Maiden's Blush; three to four feet, light, peachy pink.

West Grove; three to four feet, deep coral pink, very vigorous and free blooming.

Martha Washington; three feet, deep rosy pink, large flowers carried in dense heads.

Betsy Ross; two to three feet, bright, clear pink, probably the finest of its color.

Buttercup; three feet, deep golden yellow, very constant and reliable.

Coronet; 3½ to four feet, light pure yellow.

Queen Eleanor; two to three feet, yellow, thickly spotted with brownish-red.

Admiral Schley; one to 2½ feet, scarlet mottled and edged with yellow.

Niagara; two to 2½ feet, crimson, much mottled and very broadly edged with deep yellow flowers of great substance.

Mt. Ætna; three to four feet, dark purple foliage, large crimson scarlet flowers.

Alsace; four to five feet, large trusses of creamy-white flowers, deep-green foliage; very good for masses.

Queen of Holland; three feet, dark bronzy marbled foliage, large well-formed flowers, bright clear orange.

Pennsylvania; six to seven feet, immense dark green foliage, flowers five to six inches across, pure bright scarlet. A product of Rural Grounds hybridization, disseminated by this firm. It is a dilute hybrid of Canna flaccida and apparently the best of the type.

The handsomest foliage Canna seen here, and probably the best in cultivation, is Black Beauty, which originated several years ago in Washington, D. C. It is probably a seedling of the old Canna discolor, and is certainly no better in bloom, but the rich dark plum-colored foliage gracefully fluted at the edges makes it very attractive at all times. Black Beauty needs good culture to bring out its full beauty, and though before the public for several years has not become common owing to its slow propagation. The blooms are so insignificant that tney are best cut away as soon as they appear.

THE GOLDEN "BLEEDING HEART."—The beautiful Japan bleeding heart, Dicentra spectabilis, so commonly grown in old gardens, is one of the most familiar and useful of hardy herbaceous plants. Most country people are aware that two near relatives of this attractive plant grow naturally in rich woodland throughout eastern North America. They are popularly known as squirrel corn, D. Canadensis, from the maize-like little tubers, and Dutchman's breeches, D. cucullaria. Both have handsome, finely cut foliage and nearly white flowers, the first tipped with rose and the latter pale yellow. D. eximia, from the mountains of Virginia, has large rose-colored blooms and richly cut foliage, probably the handsomest of all our hardy plants. All the above are in commerce, and may be had from most plant dealers, but the golden-flowered D. chrysantha of California is seldom cultivated. Seeds were procured through the kindness of Carl Purdy, Santa Rosa, Cal., who stated that they were gathered from plants growing on dry hills, in localities where there was little hard frost. They remained a year in the soil before germinating, but grew rapidly after starting, making stout-branching plants about 14 inches high. The foliage is bluish green and very handsomely cut. The flower spikes began to appear in July, and a little group of nine plants has not been without bloom up to the middle of September. The flowers are of the usual heart shape, bright golden yellow with an orange-brown blotch. They are very small, however, compared with the common bleeding heart, and the racemes stand quite stiffly erect, not bending with the graceful curve associated with the garden species. As many as 50 blooms are sometimes produced in a panicle, but the effect is not as showy as one would expect from the fine color. Mr. Purdy thinks D. chrysantha will prove of doubtful hardiness in the East, but an effort will be made to carry our plants over with good protection.

NEW EARLY PEACH, MISS LOLA.—Fig. 205 represents a good specimen of the new early peach, Miss Lola, received from J. H. Black, Son & Co., Hightstown, N. J. It is a round white-fleshed peach with a clear pink and white skin, and a slight clingstone, which seems to become more marked in wet seasons. Messrs. Black say that the tree is a good grower and bears well. It comes in before Early Rivers, and just after Greensboro. The quality of the specimen illustrated was very good, better in fact than either of the two varieties above-named. The Messrs. Black regard it as about the best of its early season.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

FINE QUALITY IN PLUMS.

A remark in the paper of Mr. Garfield, of Michigan, presented at the recent meeting of the American Pomological Society, while not new, is worthy of serious consideration. His remark in the form of a query was: "Are we encouraging the consumption of fruit by growing and selling in quantity Ben Davis apples and Kieffer pears?" Is it not a shortsighted policy to continue the cultivation of this type of fruit to the exclusion of others which, though probably less productive, are much finer in quality? It has been conceded on all sides that the introduction of the Japan plums has proved a great boon to fruit growers and fruit consumers in America. While the fruit is exceedingly handsome, and the trees are productive, yet in a fruit-sampling expedition in which I was engaged a day or two ago, I could not help thinking after testing many of these Japan plums, that after all, when one wanted something really delicious and something which would stimulate the appetite rather than cloy it, one had to select a variety of the Domestica type, such as Coe, Washington or Green Gage. A Chabot or a Burbank did not arouse a keen desire for more of the same kind, but the case was different with Reine Claude and Jefferson.

It has been frequently stated that if the Japan type did not prove in itself to be exactly what we wanted, it had in it the qualities which would make it valuable in crossing with our native species. This may be so, but we have little so far as I have seen to strengthen the truth of this assertion in the many hybrids which have already been produced. On the Cornell Experiment Station grounds there are fruiting at the present time a large number of Normand's hybrids, which are crosses between the Japans and varieties of Chickasaw. The trees are intermediate in habit, are fairly productive, and the fruit is usually handsome in appearance, and combines in quality the piquancy of the Angustifolia with some of the solidity of flesh of the Japan, but the combination so far as flavor is concerned cannot be said to be desirable. There is an insipidity to the flavor which we do not like. The skin is also so thin that it obviates the possibility of these fruits having any special commercial value. After testing these hybrids I am led to the opinion that a more profitable line of experiment would be to cross the Japan with the American strain. Possibly by doing this a firmer skin and a higher flavor might be secured. A few crosses of this kind are already on trial, and appear to warrant the assumption that greater success will follow this line than the Chickasaw combination. We, at this stage, need quality, and it seems to me that quality and flavor should form one of the principal characteristics considered in selecting new varieties. We should not forget that eventually such fruit is to be eaten, and that if it is not palatable it will fail ultimately, however useful it may be for decorative purposes.

JOHN CRAIG.

Easy Harness
All harness, old or new, is made pliable and easy—will look better and wear longer—by the use of
Eureka Harness Oil
The finest preservative for leather ever discovered. Saves many times its cost by improved appearances and in the cost of repairs. Sold everywhere in cans—all sizes.
Made by STANDARD OIL CO.

Every little girl loves a doll. How delighted she would be with a whole family of big dolls with which to "play house." These dolls are nearly two feet high, have rosy cheeks, beautiful hair, heads that will not break, eyes that will not fall in, nor suffer any of the mishaps that dollies are likely to encounter. They are the 20th Century model of the old fashioned doll that Grandma used to make, and would make Grandma open her eyes in wonder. They are made of extra heavy satteen that will not tear, and are dressed in bright colors that will not fade. They are very durable and will give a child more real pleasure than any doll made. We will give these four beautiful dolls absolutely free for selling only five boxes of our Laxative Stomach Tablets at 25 cents a box. Write to-day and we will send the Tablets by mail postpaid. When sold send us the money ($1.25) and we will send you the four dolls same day money is received. Address,
NATIONAL MEDICINE CO.,
Premium Dept. 134 K, New Haven, Conn.

HOPE FARM NOTES

A SEWING LESSON.—The picture shown on the first page is a familiar one to the Hope Farmers. On every pleasant day Grandmother and the little girls may be seen out under the grape arbor with their needlework. Jack caught them with his camera one day in August. The two little girls, Bud and Scion, are quite expert with the needle. The Bud has nearly finished a large quilt and her great ambition is to be able to "sew a button on Father's coat!" We mean that the little girls shall learn to be really helpful. I have heard people tell what a wonderful thing the typewriter has been for woman, since it has given her a fair chance in business. That is all true enough, but some of these same business girls would make bad business of the family health if they were put into the kitchen to prepare meals! I hope our little girls will learn how to sew and bake and sweep and wash and do all the homely and domestic things that make the housekeeper as useful to the country as the house builder. Grandmother knows the value of all these homely things. She lived in the South during the war, when people were put to all sorts of snifts in order to live comfortably. It will be noticed that the little girls are barefooted. That is the way our children run all through the Summer. We are told that it will make their feet large! Will some one please tell me what disadvantage that will be to strong and earnest people who have their share of the world's work to do? I fear that the Bud has good-sized feet in her pedigree, anyway.

SCHOOL DAYS.—The Madame has started her little school. The Bud and Graft and the two Scions and three little folks from a neighbor's make a nice little school of seven. It's remarkable how these little minds absorb and retain what the children hear. It was a touching sight to me last Sunday afternoon to see the little Bud out on the piazza with the old Bible, which my mother gave me over 25 years ago when I went to Colorado to work on a ranch! That little forefinger traveled across the page as the child slowly spelled the words. I had no idea she could read it. When the Madame took the three other children into her school she thanked their mother for the confidence she showed in turning "her precious babies" over to another! I taught school years ago, and I am now ashamed to think that my main object in doing it was to get my salary. I do not say *earn* it, for I did not then realize the great responsibility one assumes when he undertakes to guide the mind and form the character of children. Too many people regard school teaching as they would a "job" at sawing wood or "holding down a chair." I do not want my children to go near any such teacher if I can help it. Let the Madame have charge of their habits until they are 12 years old and they will at least start right.

LIVELY CORN.—Hope Farm will have to take a back seat on the corn question when the following report from Connecticut comes in:

I noticed in "Hope Farm Notes" that corn planted July 6 is already making tassels. I can beat that, as I have sweet corn, "Kendall's Giant," planted July 8, from which I picked roasting ears to-day. September 12. W. L. H.

I did not refer to sweet corn, but to our Rural Thoroughbred Flint, which we sowed after rye for fodder. I did not expect any grain, but wanted to show that a good crop of horse or cow feed can be grown after cutting rye and removed in time for seeding to rye or wheat again. I do not know of any crop that will displace more hay in the same time. That is certainly lively sweet corn. I regret to say that the wind has blown our fodder corn down, so that cutting is almost impossible without leaving a good part of the stalk on the ground. That's the worst of sowing corn for fodder. It should be drilled and given a chance to stand up.

SOY BEANS.—The following question is from Ohio:

We raised about one-fourth of an acre of Soy beans this year. Will the Hope Farm man tell us how to get the most feed out of them? We never raised any before, or saw any growing—something new in this part of Ohio. G. S. P.

I am not able to answer from personal experience. Last year we cut the Soy beans before the pods were fully dry and fed vines and all to the hogs. They cleaned up the whole plant. Our cows did not care for the vines and only one horse would eat them. In Kansas, I am told that they cut and cure the vines about like clover hay and thrash out the beans, which are ground with corn and oats—about two parts each of corn and oats to one of the beans. This meal is said to be a good mixture for hogs, cattle or work horses. The straw or vine is fed to sheep or cattle. If I had any of it I should run it through the shredder with cornstalks and feed the mixed fodder. I shall not raise any more Soy beans, for cow peas have given us better returns.

FALL MANURING.—The following questions from Canada are hard to answer positively:

Would you advise sowing bone meal and muriate of potash in a peach orchard this Fall? Soil is level, a rather light sand, a soil which always responds quickly to manures, but which needs a good deal of feeding. Shall I sow and plow under this Fall or wait until Spring? Please answer the same question applied to wood ashes and barnyard manure. F. T. L.

On such level land as you mention I would be willing to sow the bone and potash this Fall. I have done the same thing on the lower part of the farm, but saw no advantage in it except that the job was done at a time when little other work was pressing. My own farm is so rough and hilly that I use all the manure on the fields close by the barn. We use soluble fertilizers only, and like to get them as close to the growing crop as possible. We haul manure on the level fields of the lower farm in Winter, not because it will do more good then, but because the work is easier to do at that time. Wood ashes and lime are, I think, best when put close to the crop they are expected to benefit. I would therefore use them after plowing and just before harrowing for the seed bed. In level orchards I doubt if it makes much difference when bone and potash are used, provided we can prevent surface washing.

LOSS BY DRAINAGE.—No one would think of using nitrate of soda in Fall or Winter. It is as soluble as sugar and the nitrogen will leach away through the soil and escape in the drainage water. Yet muriate of potash is as soluble as nitrate, and so is the phosphoric acid in dissolved rock. These things being so why is it safe to use potash in the Fall and not safe to use nitrate? Because nitrogen is one of the hardest of the elements to make chemical combinations. I may call Miss Nitrogen a "born old maid" with mighty little "affinity" for lime, iron or the other young fellows who innabit the soil. On the other hand, potash and phosphoric acid have a great liking for those other elements and are easily induced to remain with them. Thus when nitrogen is dissolved in the soil, if there are no roots of living plants to run after and catch her, the chances are that she will glide past the other lazy elements in the soil, and pass on to explore brook, pond, river and ocean. Needless to say that such voyages bring little benefit to man. Potash and phosphoric acid when thus started, rush to some other element and make a new chemical combination with it. In other words, they go to housekeeping right in the soil and stay there for the benefit of the next crop. Of course, when put on the surface of a hilly field the potash might be washed off and lost, but when once in the ground it is safe, while soluble nitrogen is not unless there are growing crops to utilize it.

THOSE LAZY HENS.—When the milk of human kindness sours we may expect a tragedy; but from the following note it appears that sour milk makes the hen's life such a sweet song that she continues to sound her lay without stopping to feather up:

O. J. H., on page 615, complains that his 15 hens refuse to lay and wants to know what to do about it. H. W. C., the Hope Farm man, tells him that there is nothing for it but patience. Now, we happen to have just that number of hens, and the way those bipeds turn out the eggs is certainly something remarkable, and they are only mongrels, too. We attribute it to our habit of feeding them thick skimmed milk. They have a pailful of it always before them in addition to other food, corn, etc. Nothing can be better for hen food than milk, as it contains all the ingredients necessary for egg and feather making. Too much gadding or freedom is not, we take it, conducive to egg production, so we keep them shut in till noon, and they have formed the good habit of making their egg deposits mostly before that hour, and the material required for making eggs is not diverted by long rambles, and they just have to stay in and eat milk and lay eggs for all they are worth, whether they have any feathers on them or not. They get all the exercise, grass, bugs and things they need during their afternoon run, and get back early to roost and rest in preparation for the next day's biz. J. Y. P.
Hudson, N. Y.

There is no doubt as to the value of skim-milk. That is just why we do not give it to the hens. We feed quarts of it to the children. Suppose our friend had a nice little milk trade at six or eight cents a quart and four lively little folks who clamor for milk five times a day. Would it ever be possible for any of the milk to get thick enough for those 15 hens? Not by a good deal! Better thicken the children than thicken the milk. The ecstacy which a child can get out of a cup of sweet milk beats the eggs which a hen can skim out of sour milk. We can sell or drink all the milk our cows give, and therefore the hens must get along on cut bone, meat or oil meal. You are right in saying that "too much gadding" will ruin the best efforts of any two-legged worker that ever walked the face of the earth!

GHOST OF OLD ADVICE.—Some years ago I read the story of a man who told how to get rid of stones. He said he took a big swivel plow, turned as deep a furrow as he could and then raked all the big stones he could into the furrow, plowed another over them and so on all through the field. Then he seeded to grass and had a fine smooth field! I regret to say that in those days your humble servant often looked through a smoked glass at a plausible story. My joints were rather more limber too, and I jumped *at* some conclusions instead of *on to* them as should have been done. At any rate, I regret to say that I talked that system of plowing. "Verily they have their reward!" In fitting one of our back fields for wheat we struck about an acre where some former owner had evidently tried that plan! Oh! but it was awful! Between Frank's sore shoulder and Charlie's sore ribs it was the toughest job that has yet been tackled on the farm. Charlie will tell you that the plow hit every one of those stones and then went back and hit some of them the second time. These old hard-heads kicked and fought against being turned up to the sun once more. "Why do you come and disturb us?" they said. "We went in here easily because the farmer told us we would not be disturbed! Now we will fight against being thrown out!" That's just it! It is easy to start some of these new things. Nature likes to try experiments, but how she does fight when you have to go and tell her that the experiment must be plowed out! You can't make her think that it was some other fellow who did the first job. If grass would only live forever on top of these stones it would be all right, but grass, like dogs and everything else, has its day, and must be started again. It's a tough job to pick the stones by hand, but once picked they stay where you put them Still, if my Stringfellow trees do well, this scheme of plowing under stones ought to work. H. W. C.

Big Sheaves
result from the use of fertilizers containing liberal percentages of
Potash

OUR BOOKS are not advertising catalogues, but are scientific publications, written by agricultural authorities. We mail them *free* to farmers upon request. Send your name and address to
GERMAN KALI WORKS,
93 Nassau St., New York.

LIME FERTILIZER.
Special preparation giving splendid satisfaction. Correspondence solicited THE SNOW FLAKE LIME CO., Bowling Green, Ohio.

Cider Machinery.—Send for catalogue to Boomer & Boschert Press Co., 118 West Water St., Syracuse, N.Y.

A GOOD ROOF

At a Low Price is what you get every time you use SWAN'S
The roof is the most expensive element of repair on all buildings. We help you make it the least expensive. Easily laid on new roofs or over old shingles or tin. Becomes as hard and resisting as slate. It's Fire, Wind and Water Proof. Send for free samples and circulars.
THE A. F. SWAN CO., 114 Nassau St., NEW YORK.

RUBEROID
THE
POULTRY-HOUSE
ROOFING
As a water-proof covering for Poultry-Houses, RUBEROID has no equal. Keeps the houses cool during the warm weather, and warm in Winter, and the chicks dry and comfortable. The sun cannot melt it.
THE STANDARD PAINT CO.,
100 William Street,
NEW YORK.

LAND DRAIN TILE
(Car-loads or less).
Sizes, 2, 2½, 3, 4, 5 and 6-inch.
WILLIAM T. LEGGETT & CO.
1025 Liberty Avenue, Pittsburgh, Pa.

BRAND NEW STEEL ROOFING

Bought at Receivers' Sale. Sheets either flat, corrugated or "V" crimped. No tools except a hatchet or hammer is needed to lay the roofing. We furnish free with each order enough paint to cover and nails to lay. Price per square, $1.75
A square means 100 square ft. Write for Free Catalogue No. 57 on General Merchandise. Chicago House Wrecking Co., West 35th and Iron Sts., Chicago, Ill.

Neverslip Calks
are steel-centered, self-sharpening calks which can be easily inserted or removed from the shoe on the horse's hoof and keep him "always ready" and safe from falls in slippery weather. They save your horses

and save your money. If you're not using them, give them a trial this fall and winter. Your shoer will sell you a set or we will send you a descriptive pamphlet on application.
NEVERSLIP MANUFACTURING CO., New Brunswick, N. J.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER.

A National Weekly Journal for Country and Suburban Homes.

Established 1850.

HERBERT W. COLLINGWOOD, Editor.
DR. WALTER VAN FLEET, H. E. VAN DEMAN, MRS. E. T. ROYLE, } Associates.
JOHN J. DILLON, Business Manager.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.

Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, OCTOBER 5, 1901.

PURE grape juice! We are glad to see the business of making unfermented wine growing. If the juice could be sold cheaply on every block of this great city we believe it would prove one of the most effective temperance agencies ever started.

*

PROVIDENCE, R. I., was receiving peaches from 10 different States at once recently. Think of one local market reaching out for supplies from Connecticut to California! What would the big western States do without the little eastern States and their markets?

*

THE counsel for the wretched murderer Czolgosz could find no word of argument for his client. He did, however, make a strong plea for a fair trial before the law. Among other things he said that there is more danger in lynch law and mob rule than there is in anarchy, and we believe that he voiced the sentiments of the great majority of the American people when he said so!

*

SOMETIMES a farmer works hard to seed down a piece of ground. It may be tough and sticky and stony, requiring twice the time and labor to prepare it that would answer for another field. Under such circumstances one would think that the farmer would aim to keep that land in grass as long as possible, since nature seems to have designed it for sod. Yet, some farmers proceed deliberately to shorten the life of the grass. They give it but little more preparation than they do the even and easily worked fields. They use but little seed, only a pinch of fertilizer or manure, and worst of all, they turn in the stock after mowing to gnaw and tramp the grass out of sight. No wonder the field gives out after two years' cutting, when with good care and judgment it ought to give good crops for five or six years.

*

AT the meeting of the American Pomological Society Prof. M. V. Waite gave some interesting facts about bees and Pear blight. His experiments seem to show that the germs of this disease may be and are carried from tree to tree by bees. Grant that, and still the bees have a credit on the books of the fruit grower. Kill off and banish the bees, and while there might be less blight there would certainly be much less fruit. We feel certain that any fair-minded man who will really investigate the matter will be led to admit that bees are the true dry nurses for the baby fruits. Without them the flowers would most certainly not be fertilized. Prof. Waugh, of Vermont, covered 2,586 apple blossoms so that insects could not get at them. As a result there were only three apples, even on the varieties which are thought to be perfect flowered!

*

WE have received the following excellent suggestion:

May I be permitted to suggest one way in which your readers may appropriately honor the memory of President McKinley? In the cities people gather to hear addresses; they drape the buildings in mourning, pass resolutions and publish them in newspapers, and do such other things as will tend to keep in mind the goodness and greatness of the deceased President. In the country his memory may be most fittingly perpetuated by setting out useful trees. Almost every family may do this, and this is peculiarly a favorable season for it.

Hartford, Conn. J. LINCOLN FENN.

We endorse this suggestion heartily, and hope that our readers will plant thousands of McKinley trees. Let them be planted on the most prominent places on the farm, where they may stand for years, telling to coming generations the story of a noble life. It is true that town and city show more of the outward evidences of grief—yet such sorrow is often short lived. The struggle for life is hard and bitter in the town, and there are hundreds of things which quickly draw the public attention. In the calm, quiet life of the farm noble memories remain longer in mind. It has been said that about all the patriotism we have left in this country is found among farm freeholders. By all means let us have McKinley trees.

*

WE still think that the corn is not short enough to warrant higher prices for the grain. Through the districts where silos are numerous the growth of stalk has been very heavy, and all through the West we learn that thousands of acres of stalks have been cut—ready for dry shredding. All this use of the stalk will leave more of the grain free for sale, and these conditions must be considered as well as the decrease in the actual grain crop. We believe that the present high price of wheat bran is not warranted by the market conditions, since the wheat crop is one of the largest ever known, while the exports of bran to foreign countries is considerably less than last year.

*

IN Germany large quantities of cheap alcohol are made from potatoes. The Emperor has offered a prize for the best stationary engine capable of using alcohol as fuel, the object being to stimulate the demand for potatoes for this purpose. The heavy tax imposed on all alcohol in this country puts it out of the market for fuel or similar industrial uses. Considerable of this potato alcohol finds its way into the lower grades of wines and liquors, so it is quite possible for a man to become drunk from the product of this innocent-appearing tuber. The Germans are wise to encourage the use of alcohol as a fuel. In France it is largely consumed as drink, and this different use is given as one reason for the fact that France lags behind Germany.

*

A CAMPAIGN of education, which might well be imitated, is that inaugurated by the British Columbia Fruit Growers' Association, in sending an expert to the Fall local fairs, to give practical demonstrations in fruit packing. We have often referred to the need of careful and attractive packing; it is a matter that the fruit grower must necessarily study. Many, however, still err from lack of knowledge; they are willing and anxious to pack their product in the best manner, but they lack the manual dexterity which accompanies the "know how." To them the work of the expert would be an object lesson of great interest and value. Such practical demonstrations never fail to hold the attention of an audience, and would form an educational feature in any agricultural or horticultural gathering.

*

THE following letter is sent us from the State of Washington. Snohomish County is far from headquarters, but THE R. N.-Y. must travel far to get away from its friends:

As a child I read THE R. N.-Y. As a girl I read it, and as soon as we were on a piece of Uncle Sam's land that we could call our own I subscribed for it. I am 43 years of age, and though only a woman can say I have loved and read THE R. N.-Y. since I was nine years of age. This morning the better half was sick, and I was in a hurry to build a fire. The first paper I picked up was a R. N.-Y., but I couldn't find a page I wanted to spare; took up another; it was again the same. Then I picked up a daily paper and put it in use at once.

When the housekeeper starts to build her morning fire the ticks of the clock mark precious time. There is a busy, working day ahead of her—all too short for the many duties that crowd the waking hours of a farmer's wife. We feel that when such a woman will stop and examine THE R. N.-Y. page by page and decide that no part of it should be used for kindling, that the paper has received about the highest compliment that can be paid it. It ought to be the ambition of every editor to write and print words that are strong enough to live—to kindle ambitions rather than kindle fires!

*

LAST week we had something to say about the American Apple Consumers' League. There are some faint-hearted League members whose throats become as dry as a Ben Davis apple, when a mellow word might help their country. For the benefit of such nerveless people we give a bit of history. Two years ago we received the following note from the proprietor of a first-class restaurant in New York:

I have been particularly interested in your frequent writings on apples, so much so that I have introduced them in my restaurant, and am working up quite a demand for them. The trouble that I experience, however, is in finding those delicious apples about which you write. Can you recommend to me some man or men from whom I could obtain a fine eating apple that has a name, and one that I could get right along during the season as I want them? I am not particular about the price, if I could get the quality.

Of course we told our friend at once that Spitzenburg is the king of baked fruit and named some men who ought to supply the apples. Then came the following:

After receiving your letter I sent to the commission man and bought a barrel of Spitzenburg apples at $6 and used them for baking, and as you assured me, they were fit for a king. The only trouble was that they were too small; two served on a plate seemed like a small portion, and three would take away most appetites. I never could get but one lot, as they did not have them. I then wrote to the other parties but got no reply. So I fell back on Rhode Island Greenings. Why don't some of the apple growers advertise in THE R. N.-Y.? What is this Apple Consumers' League about which you write?

Now here was a man willing to pay almost any price for Spitzenburg apples, but unable even to hear from those who ought to have them. There are thousands like him right here in this great city, who want good fruit, and are ready to pay for it. They will go and buy the California apples because they come nicely packed in *boxes*. The Apple Consumers' League is doing a good share of this—are you helping?

*

SUPPOSE that from the first the manufacturers of oleo had been content to make and sell their mixture for just what it is without any effort to counterfeit the color and appearance of butter! By this time they would have secured a good market at a fair profit. They would have saved the vast sums of money which they have paid for defending suits and "influencing" legislation, while the moral effect upon the trade would have been marked. There is and always has been a fair profit for the manufacturers in selling oleo for just what it is—a mixture of fats, all of which are cheaper and less delicate than the fats of milk! Let it be remembered that the conflict and trouble to-day is the fault of the oleo men rather than the dairymen. If the oleo men had not attempted to counterfeit a genuine market product it is not likely that a sound case could have been made against them.

*

BREVITIES.

I used to blow the organ in a good old country choir,
I kept the bellows crowded full and never used to tire;
I seemed to catch a vision of the promised happy land,
When that old organ thundered underneath the player's hand.
Now here's the point I'm making—please to notice "where I'm at."
That wind was *raw material*, and mighty raw at that;
But when it came a-rushing that old organ's piping through,
It then was *finished product*, way up on its finish too.
I did the hard, *raw* labor—pumping in the wind, you see.
The organist did better—a skilled worker, sir, was she;
A hundred boys could handle my pump job at any day;
The church was minus music when that woman stayed away.
And so, in early childhood, I pumped out this settled law.
To dodge old competition just quit handling the *raw*
And learn to make *skilled products*; you will live to find your fill,
Of good things will be greater as you cultivate your skill,
The folks who at the organ stay there ever pumping wind
Have hardly cause to grumble when they tag along behind
Those folks who learn to handle every pedal, stop and key,
That lets the wind from prison in a flood of harmony.

YOUR dearest idol is probably *I*.

WORDS without work make wind.

HELP spread the baked apple habit.

SOFT pencil and soft paper make a hard job for the printer.

WE are having a hard race with Jack Frost for the corn crop.

NOTICE how Keiffer pear is taking a back seat? Ben Davis apple will follow.

WHAT have you in your performance or in your pedigree which will justify you in putting on airs?

No man has any right to strike hard blows unless he is ready to take equally hard ones without flinching.

WHAT is the most profitable form of charcoal for poultry? Probably that obtained from burning up the scrub fowls.

A MAN may have his arm or leg paralyzed and still live so as to benefit the world, but when the paralysis strikes his conscience—bury him!

SOME of the new "hotels" and boarding houses at Buffalo are perfect tinder boxes. Oh, but how they would burn if a little flame started!

ONE of the hardest things for farmers to understand is the fact that soils derived from limestone often need air-slaked lime before they will produce a full crop.

THE Kansas Experiment Station people find that wheat straw with ground wheat added will keep cattle through the Winter. That is important to know where people are selling stock for lack of feed and burning straw stacks to get rid of them.

THE fight against mosquitoes has been reduced (or raised) to a science on Long Island. A "mosquito map," covering many square miles, has been prepared, showing every body of stagnant water, and even the various "breeds" of mosquitoes. Having mapped the mosquito we hope our Long Island friends will now proceed to wipe him off the map.

Events of the Week

DOMESTIC.—Frank Idings, the man who said in a Cleveland, O., saloon that he belonged to a society that would pay $50,000 to any man who would kill President Roosevelt, was, September 18, ordered turned over to the Board of Managers of the Ohio State Penitentiary. Idings was identified as a paroled convict. He was sentenced to the penitentiary in March, 1898, to serve five years for burglary and larceny, and was paroled in December, 1899. As a result of his recent utterances Idings will serve at least two years more in the State prison. . . . . The assassin Czolgosz, when brought into the dock at Buffalo, refused to answer the indictment. He is believed to be shamming insanity. His counsel entered the plea of not guilty, and asked permission to call in alienists to examine the murderer's mental condition. He was pronounced entirely sane, and was declared guilty September 24. . . . . A misplaced switch caused a collision between express and freight trains at Brocton, Mass., September 18, in which six passengers were killed and 25 injured. . . . . Forest fires are causing great damage in Boulder Co., Col. September 19, 35 square miles of timber had been burned near Eldora, and the town was threatened. . . . . The report of the engineers who have been examining the great Brooklyn Bridge shows that it is now loaded to the limit, and a few more tons massed at one point would make the structure dangerous. The experts recommend a new outside truss and other repairs which would cost $1,000,000. . . . . The steamer Hudson, with crew of 25, was lost off Eagle River, Lake Superior, during a gale September 19. . . . . A gas explosion in the department store of A. M. Rothschild & Co., Chicago, Ill., wrecked a huge wall September 19, causing a loss of $250,000; several persons were injured, but none killed. . . . . The State Insane Asylum at Norfolk, Neb., was destroyed by fire September 23; two lives lost. The damage reaches $150,000. . . . . The Governor of Texas has signed the "Blind Tiger" bill, which imposes severe penalties and imprisonment for shipping intoxicating beverages into local option communities.

THE LATE PRESIDENT.—Thursday, September 19, the remains of President McKinley were interred, after simple and impressive services, at Canton, O. Memorial services were held and public mourning displayed all over the country. In British India, memorial services were held in all the central cities, and September 19 was observed as a day of public mourning. The British Channel Squadron and the land batteries at Gibraltar fired a salute of 21 guns. In France, many emblems of mourning appeared among the decorations displayed in honor of the Czar's visit. . . . . Tests by chemists and bacteriologists prove conclusively that Czolgosz did not poison his bullets, as was suspected by Dr. Wasdin. . . . . The expense incurred by the death of the President, including medical attendance and funeral, will be met through a special provision of Congress. Aid will also be given Mrs. McKinley. .. ..

PHILIPPINES.—Gen. Hughes has expelled a number of English traders from Samara for aiding the insurgents by buying hemp and other supplies. . . . . The new Philippine tariff, as approved by the War Department, was enacted into law by the Philippine Commission September 17, to take effect November 15. Governor Taft has cabled the War Department asking that printed copies of the new tariff in both English and Spanish be sent at once, in order to reach the Philippines on the date when it goes into effect. If the copies cannot reach there at that time it will be necessary to postpone the date when the tariff goes into effect until December 1. All the important features of the new tariff have been made public heretofore.

GENERAL FOREIGN NEWS.—The British torpedo boat destroyer Cobra struck a rock in the North Sea September 19; an explosion followed, and she sank immediately; 55 lives lost. The Cobra held the record as the fastest vessel in the world. . . . . An explosion in a powder factory at Ripault, France, September 19, killed 11 persons, and seriously injured 17 others, most of them fatally. . . . . There is a renewal of activity among the Boers, and there is no sign of settlement in South Africa. It is said that President Kruger will appeal to President Roosevelt for intervention. . . . . England has been celebrating the millenary of King Alfred the Great.

FARM AND GARDEN.—The first snow of the season fell at Grand Forks, N. D., September 17. It was very light and came at the end of a slight shower. The weather is very unfavorable for thrashing. Thousands of acres are still in shock, and there is some anxiety lest the farmers should be unable to finish.

Frost occurred in western Missouri and eastern Kansas September 18, an earlier date for the first frost than for many years. Vegetables planted after the breaking of the drought, in the hope of raising a crop before frost came, were damaged.

T. S. Gold, of West Cornwall, has retired from the secretaryship of the Connecticut Board of Agriculture, after long and efficient service. His successor is Col. J. F. Brown, of North Stonington.

A severe frost was experienced through northern and central New York September 19. Ice formed on shallow water and truck farm products were injured.

Prof. C. C. Georgeson, in charge of the Alaskan experiment stations, has reported to the Department of Agriculture that he has found good gardens all along the Yukon Valley in the cold interior region of Alaska. The report says that, although the season was unusually late this year, Prof. Georgeson found new potatoes, cabbages, cauliflower and beets and other vegetables ready for the table before the middle of August, and lettuce, radishes and turnips grown in the open had been in use for several weeks. Flower gardens containing a large variety of annuals grown from seed furnished last year were in full bloom. Similarly encouraging reports are given for Spring-seeded barley and for oats and wheat.

October 10 is set as National Grange day at the Pan-American Exposition. An interesting programme has been arranged, including addresses by many prominent workers in the Order. All Patrons of Husbandry and farmers generally are invited to visit the Exposition at that time.

It is believed that the Oregon hop crop will not exceed 60,000 to 65,000 bales, which is less than was anticipated, but the quality is good.

THE CANADIAN CENSUS RETURNS.

I hear very little said about the census returns by farmers here. I have been living here more than 40 years, and I think that the population is increasing as fast as it ever did. The land in general here is rough, and not all suitable for farming, so the increase in population goes to other parts of Canada. A good many have gone from here to Manitoba, and have done well. The incomes from land are better a good deal than in former years. J. H.

The Ridge, Ont.

I am not in a position to give you any information that would be reliable. My own opinion, from reading the newspapers, would be that it had been taken in a very careless fashion, which might account for so small an increase. Concerning farm values here, farms are dear, taking productiveness into consideration, so much so that I am selling and going to the New England States. I am just home from there, and can buy a farm for $2,500 that would sell for $3,500 here. I do not understand it, but the fact remains. I am 30 miles from Montreal; in the eastern townships farms are much cheaper than 20 years ago, and farmers are not making so much, but prospects are a little brighter now, as stock of all kinds is selling much higher than two years ago. F. P. R.

St. Sophie, Quebec.

While it is a fact that the census returns show a very small increase in the population of Canada for the past 10 years, and to a person not acquainted with the matter it would appear that the population of this country is increasing very slowly, at the same time it is very evident to one living in this country, who understands the matter, that the increase in the population for the past three or four years has been very great. Until within the last three or four years a very large per cent of the young men went to the United States to seek their fortune, and were, I am glad to say, successful, and a large per cent of the immigrants to Canada only stopped here for a short time before they went to the United States also. This was a great drain on Canada at that time, but I am happy to say that has all changed now; the people of this country have great confidence in their own land, and are mostly prosperous and doing successful business in their different trades. The young men are now remaining in Canada, and the immigrants stay here. Therefore you see it has taken a very large per cent of the increase for the last four years to make up what the country lost in the six previous years. Farm lands in Ontario are to-day about the same value as they were 20 years ago. The reason for their not increasing in value is owing to the great western part of Canada opening up (which commenced about 20 years ago); the eastern expensive lands cannot compete with the cheap western land in growing grain, and the probabilities are that farm lands in eastern Canada will not increase in value to any great extent until the very choice lands of western Canada become all taken up and settled. I was through western Canada a few weeks ago, and after a person takes a trip through that part of the country, and sees the wonderful opportunities which are offered for all branches of agriculture, it does not surprise one that farmers go west and take up land (which only costs $10 and homestead duties for 160 acres) instead of purchasing the expensive eastern lands on which it takes a lifetime to make enough to pay for.

Picton, Ont. A. M. T.

The Canadian census returns, on the whole, were somewhat disappointing. As regards Ontario observing persons were not expecting the census returns to show much of an increase for the following reasons: The tendency is to increase the area of the farms through the older settled portions of this Province. The more progressive and wealthier farmers have been gradually buying up the small farms adjoining them; 40 years ago a large proportion owned 50 and 100-acre farms. The families on each of those farms then were more numerous than now. It was not uncommon then to see families of eight to 12 children. Households of that size are now very scarce, having apparently gone out of fashion. Those large families, as they grew up, moved to newer countries, where land was cheaper, mostly to the Northwest, quite a number crossing the line and swelling the population of our Uncle Sam. Farm help consequently became scarce, and machinery of all kinds came into use. The same set of implements doing the work on a 200-acre farm that would be required on 50 acres, the tendency has been to increase the size of the farms and decrease the population. The farm which I own consists of 316 acres; was originally owned and occupied by five separate parties, each having good-sized families, with occasionally families of laborers occupying vacant houses. Two of the adjoining farms have been made up in the same manner. This, I think, is a fair sample of most of the older-settled parts of Ontario. When I went to our district school we had an average attendance of over 60 pupils. Our average now is about 20, while there is more land worked in the same district, better tilled and more productive. Thirty-two years ago I bought the 50 acres that I now live on for $32 per acre; can sell it to-day for $70. My impression is that farm lands in this county (Oxford) are worth one-third more than they were 20 years ago, with no trouble to sell, the incomes of the farmer being much larger than they were at that time. Then a large quantity of grain was sold from the farm, a great part of our barley going to the United States, and some of our other grains, but our protective walls stopped that, and we sought other markets, and gradually changed our products. We now feed most of our grain at home, turning it into cheese, butter, beef and bacon, and find that this method improves our farms and is more remunerative. Incidentally I may say that I favor free trade. G. A. M.

Embro, Ont.

DELIGHTFUL weather; finished marketing peaches today; large crop. Potatoes small, $1 per bushel. Very few apples, $2.50 per barrel at home; 40 cents per 100 for cider apples. Corn gathered; fair crop. Buckwheat, a large crop, 55 cents a bushel. Pasture good. L. T.

Ulster Co., N. Y.

Crop and Weather Notes.

The past week has been unseasonably cool in nearly all sections east of the Rocky Mountains, with more or less frost in the Central and Atlantic States. Late corn has been nipped by frost in North Dakota and the northern portions of other States in the corn belt, also on low lands in Ohio and Indiana; but most of the crop east of the Mississippi is matured, and cutting is well under way. Heavy rains in California have damaged grain, hay and grapes, and cotton in the South Atlantic and East Gulf States has suffered from the same cause. Open cotton has been discolored and beaten out, and sprouting and rotting are also reported. Most of the tobacco crop is housed and in good condition. Early-sown wheat in the central valleys is coming up well.

General Crop Notes.

WE have had dry and hot weather during July and August. First frost September 18, killing green potato tops. Corn nearly all ripe, one-half crop. Wheat good. Oats medium. Hay an average crop. Clover seed one to four bushels to the acre. Early potatoes scarce, late potatoes not dug yet; will not be more than half crop, no rot yet. Fruits, except apples, a fair crop. T. C. K.

Butler, Ind.

C. I., of Rochester, N. Y., wishes to know if any of the readers have sown rye after potatoes and plowed under for oats. We sowed rye after potatoes this Spring; we plowed half under for oats. We waited until the rye was 10 or 12 inches high. My stepson entered one peck each of the oats and rye at the Suffolk County Fair and took first premium on both the first day of fair. We plow under rye for most all of our crops, potatoes, corn and cabbage. The cabbage for seed next season is looking very fine. Potatoes and corn are good.

Calverton, N. Y. O. J. L.

The Clover Seed Crop.

The clover seed crop in this vicinity is a total failure, caused by the protracted drought. I don't believe there will be 10 bushels thrashed in the whole county.

Hillsboro, Ill. L. D. O.

As to the clover seed crop, I think there will be very little here. There were very poor stands secured from the sowing in 1899 and 1900. The young clover at present looks fine. J. E. D.

Steel, Ohio.

The crop of clover seed in this section is shorter than it has been for years, few farmers raising enough for their own seeding. I am told that the quality is not No. 1. N. W. W.

Knightstown, Ind.

There is not over half a crop of clover, and the seed is very light, owing to extreme drought this Summer. The corn crop will be about one-third of a crop. The wheat is also very light. The entire region has suffered from drought the past Summer. W. F. T.

Hanover, Ind.

I got nine bushels of clover seed from about nine acres. A neighbor of mine, John Jones, hulled 35 bushels of seed from 50 acres; Wm. Douglass got 60 bushels from 15 acres. John Cadwallader's 16 acres of clover yielded him about one-half bushel per acre; Thos. Johnson got two bushels from eight acres, Wm. Brann got two bushels from five or six acres. These yields are a fair sample of how it is hulling out. Mr. Douglass got a remarkably big yield for the season. It is generally yielding about one bushel or less per acre. Owing to the severe drought we had the clover plant was very short and the heads small. It was all hulled before the rains came on it, consequently the quality is very fair, but the seeds are smaller than usual. It is worth $5 per bushel here. The chaff, after hulling, sells for about $5 per ton. The yield is less this year than common. J. L. C.

Bushnell, Ill.

The Potato Crop.

Potatoes only about one-half a crop of former years; have heard of no complaint of rotting. J. S.

Illinois.

I should think the yield less than for the past few years, but there seems to be a fair crop. Not many are harvested yet. There is no rot that I have heard of.

Dryden, Mich. F. B.

The potato crop is extremely short in this vicinity this year. Late potatoes are still growing with plenty of rain now. Not one farmer in 10 will have enough for his own use. I have 25 rows 30 rods long on the best of new ground, which I judge will go one and one-half to two bushels to the row, of potatoes about the size of hen's eggs. M. M. M.

Caledonia, Ill.

The yield of early potatoes was about an average one compared with former years. I think 100 bushels would be a fair estimate per acre. Quality good. Price started at $1, fell to 70 cents, then continued to advance until now they are selling at $1 to $1.10. The late crop in most places is not yielding above one-half crop. Some rot in center of tubers, and in the R. N.-Y. No. 2, I find some with black at stem ends. I do not know how prevalent this will be, as they are not ready yet to be dug. I hear of some that have been pitted of the earlier varieties rotting in the pits, but cannot say at this writing how general it is. E. B. M.

Bloomington, Minn.

A short time ago the Vermont Experiment Station at Burlington sent out word that the Potato blight and rot threatened to do serious damage in Vermont this Fall. Later reports from the same source say that the fears of trouble were all realized, and that there has been in fact a considerable amount of loss already to potato growers. The rot follows the late blight and comes from the same cause. Those who have late blight in their fields, therefore, are bound to have rot; and in all such cases special care ought to be taken in sorting and storing the potatoes for Winter. The experiment station still insists that proper spraying, backed up by proper cultivation, will protect the potato crop from these diseases. Continued experiments and practical field tests covering a period of 10 years, or more, have proved this beyond the possibility of doubt. Even now, in the latter part of September, when most potato vines are dead, and many fields of potatoes already dug, the experiment station potato fields are as green as any time in July or August; and the potato expert claims that they are making potatoes now at the rate of 25 to 30 bushels a week for every acre.

Woman and Home

From Day to Day.

FROM THE "AMEN CORNER."

[Prof. Triggs, of the Chicago University, has created considerable diseussion by elaiming that most of the hymns are "doggerel."]

They say the hymns is dogg'rel—that they ain't fine enough;
That all the time we've sung 'em they've been nothin' else but stuff;
They say they need revisin'—we must make 'em more pollte,
"On Jordan's Stormy Banks I Stand" is not eonstructed right;
But, just the same, perfessor, you had better let 'em be—
The Lord—He understands 'em—so they're good enough for me.

I s'pose there's nothin' finer than that good old "Beulah Land,"
And when our Lizzie slngs it you ean see the glorles grand;
When "Roek of Ages" rings out from the hallelujah shore,
I tell you this old sinner ain't a goin' to drift no more;
And when they strike "Amazin' Grace," eaeh feller singin' free—
The Lord—He understands it—so it's good enough for me.

It isn't what you're singin'; why, I oftentimes forget
And praise the Lord to musie with the good old alphabet,
Untll I strike the words again, and I don't think it's wrong—
It isn't what is in it, but the soul behind the song.
So I tell you, perfessor, you had better let 'em be—
The Lord—He understands 'em—so they're good enough for me.

—Baltimore Amerlcan.

*

HANDSOME souvenirs of New York which are now offered are tall slender pewter tankards, with raised scenes on the outside, showing places of interest—Grant's Tomb, the Metropolitan Museum, etc. They cost $1 and upwards. Pewter is now a fashionable ware, and anyone who has platters, cups or jugs of this metal may display them with pride.

*

A NEWSPAPER note tells us that cigarette smoking has become a positive mania with both boys and girls in Iceland, and the municipal authorities of Reykjavik are considering an ordinance which, if adopted, will permit any adult, man or woman, to box the ears of a juvenile offender, annex his or her weed, and impound the stock of cigarettes. This ordinance sounds like Mrs. Carrie Nation, but a good many of us never ee a cigarette smoker of tender years without wishing that law or custom empowered us to proceed upon exactly the same lines.

*

THE New York Sun recently quoted the following as a form of prayer prepared by a school of Christian science:

Forgive us our sins In that we have this day talked about our backaches, that we have told our neighbors that our food hurts us, that we mentioned to a visitor that there was a lump in our stomach, that we have wasted our valuable time, whieh should have been spent in Thy service, in worrying for fear that our stomach would grow worse.

Without considering the quotation from a religious standpoint, we think that a good many people should pray for grace to refrain from inflicting their aches and pains upon others, in just such fashion. A witty woman once asserted that she gained her reputation for wit by abstaining in conversation from the three D's—dress, domestics and diseases. We don't mind owning that we can endure a certain amount of dress talk without visible impatience, but when the second D is reached we feel like the woman at a club meeting who complained that she felt lonely and isolated, because she was the only woman in the room who hadn't been having trouble with her servants, and a free discussion of the third makes us feel as though we were developing symptoms of every known disease, from anemia to zymosis.

*

A VERY pretty waist of white flannel was made with a broad box pleat, tapering a little towards the waist, down the center of the front, and one narrow pleat, also shaped, on each side. The center pleat was about four inches wide at the top, tapering gradually to the waist. Flat pearl buttons were set down this in groups of two, with an intervening space. Pearl buttons, both black

3921 Misses Sailor Waist, 12 to 16 yrs.

and white, are freely used on the new flannel waists, seeming to take the place of the perpetual military gilt of last Winter. Corduroy is to be very popular, both in shirt waists and skirts. It comes in all colors, and in white, makes really beautiful waists. Corduroy skirts are usually either gray or brown, made walking length, with a gored flounce. They look particularly well with a red waist.

*

IT is an excellent idea to make Fall and Winter shirt waists with a separate lining; that is, make an underwaist of soft-finished cambric, percaline or double-faced waist lining, with long sleeves and high neck, to wear under woolen shirt waists, which should be unlined. There are many advantages in this plan. An unlined flannel waist may be washed readily, without the fear of the outer fabric shrinking unevenly from the lining; it may be pressed more readily if wrinkled, and, in the prevailing style, is likely to fit better in front, for it is often difficult to avoid some clumsiness at the fastenings. An unlined flannel waist is often a decided convenience between the seasons, in our uncertain climate. For a white Winter waist, nothing is more serviceable than one made of fine white flannel, such as is used for underskirts, not twilled. The twilled flannel thickens much more than this does, which may be washed over and over again. It should, of course, be made with the separate lining.

The Rural Patterns.

The shirt waist with sailor collar, and shield of contrasting color is, and will be, a favorite for young girls both for school and afternoon wear. For the school the materials chosen are cheviot, linen, madras, flannel, cashmere and the like, for the more fancy waists silk of simple sorts, embroidered and plain cashmere in light colors. The foundation is a fitted lining, on which the waist proper is arranged when silk and wool fabrics are used, but which can be omitted when washable materials are selected. The lining closes at the center front, and fits snugly to the figure, but the waist proper is drawn down in gathers at the waist line and blouses slightly at the front. The shield is attached to the lining, when it is used, to the waist beneath the collar, when the waist is unlined, and is attached permanently at the right side, hooked into place at the left. The sailor collar is seamed to the neck of the blouse and the tie ends are attached beneath its points. The sleeves are in bishop style with narrow pointed cuffs. To cut this waist for a girl of 14 years of age, 3½ yards of material 21 inches wide, 2½ yards 27 inches wide, 2¼ yards 32 inches wide or 1⅜ yard 44 inches wide will be required, with ¾ yard for shield, stock collar, tie and cuffs, and one piece of velvet ribbon to trim as illustrated. The pattern No. 3921 is cut in sizes for misses of 12, 14 and 16 years of age; price 10 cents.

The fancy blouse may be made with stock or V neck, long or elbow sleeves. The foundation is a fitted lining that closes at the center front. Both back and fronts of the waist are stitched in groups of four fine tucks, then arranged over the lining. The waist proper closes beneath the center group of tucks, but the yoke is attached to the right front only and hooked into place at the left shoulder. The elbow sleeves are tucked to within a few inches of the lower edge, where they fall free to form frills, but the bishop sleeves are plain, finished with narrow cuffs. To cut this waist for a woman of medium size 3¼ yards of material 21 inches wide, or two yards 44 inches wide will be required with two yards of lace insertion, three yards of narrow and 2½ yards of wide velvet ribbon to make as illustrated, 3¾ yards 21 or 27 inches wide, or 2¼ yards 44 inches wide to make with bishop sleeves. The pattern No. 3913 is cut in sizes for 32, 34, 36, 38 and 40-inch bust measure; price 10 cents from this office.

Grocery Suggestions.

In using canned goods put up in tin, says the Woman's Home Companion, once the can is opened the contents must be taken out immediately. If there

3913 Fancy Blouse, 32 to 40 Bust.

is more than is needed at the moment, put what is left in an earthen dish. When there is time, open the can an hour or so before it is to be used, and turn the contents into a dish or bowl. Before using peas, beans or asparagus turn them into a colander, and rinse with cold water. Many fruits and vegetables are put up in glass jars. They come higher in price, but there is no fear of corrosion, as sometimes happens when tin is used. In no case must the sun shine for any length of time on tinned goods. In buying canned goods there is quite a saving if they are bought by the box or even by the dozen.

In addition there are dried and evaporated fruits of all kinds. These need only to be soaked for a few hours before they are cooked. Kept in a dry place one buying will answer for a long time. Prunes, apples, peaches and apricots are the most desirable of the dried fruits. Prunes should be used frequently; cooked with apricots they are much better than when cooked alone. Lemon should be cooked with prunes if apricots are not used.

There are many jelly powders from which for 10 cents one can make a moldful of very palatable jelly. By the addition of the juice of a lemon, fruit juice or other flavoring it can be made really delicious. Boiling water is poured on the powder, and it is ready for the mold. It cannot be said that these jellies are the equal of those made with fruit and gelatine and the expenditure of much time and trouble; but for those not epicures, and for plain, workaday people, they form admirable little desserts. This is one of the many interesting and excellent ways by which modern commercial science is helping families of moderate means.

With the Procession.

A Housework Girl.

"Folks are dreadful provoking sometimes, but I don't know when I ever was so discouraged about anybody as I was when Cousin Cynthia Mason's daughter Ella come to stay with me a spell. Your speaking of your girl not liking to do housework, Miss Drake, makes me of it.

"When Cynthia died, it left Ella pretty much alone in the world, but she had lots of friends in the city and I knew she'd had advantages, so I thought of course she'd get along as nice as could be.

"Well, it went on for a year or so, and then one day I got a letter from her saying she'd like to come and stay with me for awhile. She said that everything was so crowded in the city there wasn't no chance for a girl, but she thought she might do something in a country town. I told her to come along and I'd do the best I could for her.

"Well, she hadn't been with me 24 hours before I see what was the matter with her. She was a pretty girl and had nice manners. She had a pleasant voice and had took lessons, and could sing, and play on the piano considerable. She had gone to a business college for one term and knew a little about bookkeeping. She could draw and paint quite nice, and when her mother died she was planning to be a kindergarten teacher. She stayed with me a fortnight, and I did my best to get work for her, but nothing come of it. Her clothes kept getting shabbier, and her money kept getting lower, and she was dreadful blue.

"At the end of two weeks I said to her one night after supper: 'Ella,' I says, 'I'm going to have a good plain talk with you. I s'pose it'll hurt your feelings, but things have come to such a pass that I've got to speak right out. I mean it for your good, and I'm going to help you all you'll let me. To begin with, I'm going to tell you why you don't get any work. It is because you haven't got anything to sell. This is a little country town, but the folks here ain't fools. When they hire a bookkeeper they want one that knows her business; they don't want to have to teach her how to do the work they pay for. It's the same way with music; lots of the young girls here in town can sing and play bettern you can, so you ain't competent to give 'em lessons. You can't paint or draw as well as the regular drawing teacher that teaches in the schools.'

"By this time she was looking at me as though I'd insulted her. 'Aunt Asenath,' she says, 'if I had enough money to pay my car fare, I'd go back to the city to-night.'

"'I expected you'd get mad,' I says, 'but s'pose you wait till I get through talking. I haven't got money to spare to send you to business college or to music or drawing teachers, I don't doubt you've got the ability to succeed in any of those things; you lack the training, that's all. Now there is a training that I can give you, and I'll do it gladly. It's something you and every girl ought to know how to do, and if you'll learn you'll be able to earn your living and be independent.'

"'Well,' she says, when I stopped, 'what is it?'

"'It's housework,' I says.

"She just sat and stared at me. Then her face begun to grow red. 'Housework!' she says with a sniff. 'Housework!' Then she laughed. 'I'm not quite so poor as that, yet,' she says, and she got up and would have gone out of the room, but I called her back and made her sit down again.

"'I guess you can wait till I get through,' I says. 'What I propose is this: I'm going to have some boarders next Summer, and I shall have to hire extra help. If you will stay with me I'll teach you how to do housework, and when you get so you are worth it I will pay you wages. Your mother made a mistake in not teaching you to do housework, but I know she thought she was doing what was best for you. If you'd known even a little about it there's lots of situations I could have got for you. I know of two or three nice old ladies you could have been companion for, and there are small families where you could have had a good home and fair wages.'

"'You think you are too good for housework,' I says, to end up with, 'but have you thought how that sounds to one who is doing housework for you? It's honest work, and it takes brains just as much as anything else, and it's something every woman ought to know how to do, I don't care who she is.'

"Ella stood up and looked at me. You never see anyone look so offended. 'I will think over your proposition,' she says as stiff as could be, 'but I don't *think* I shall accept your very generous offer. The idea of my being a housework girl!' and she laughed a real unpleasant laugh and went off to bed.

"'I think you'll come to it, my young lady,' I says to myself, 'and pretty soon, too, if you haven't got 45 cents to your name.' I don't deny I was considerable riled. I take pride in doing my work well, and to have her act as though I'd insulted her did make me feel kinder hard towards her for a spell. Then I reasoned that she wa'n't to blame, and that 'twas all on account of her bringing up, so by the next morning I felt as kind as ever to her, and her stiff, dignified ways only amused me.

"Things went on for most a week, and I declare! I most began to think she would get work, she was so busy hunting for it every day. One day I was in the sitting room looking over the paper, and I heard Ella come in. She went to her room and stayed there for quite a spell. She was so quiet I most forgot she was there, when all of a sudden her door flew open, and she came running across the room and threw herself down in front of me with her head in my lap. She cried there softly, for awhile, then she quieted down some and says, 'I'm at the end of my resources, Aunt Asenath. I spent my last cent for an advertisement four days ago, and nobody's answered it. Now I'm ready to do anything you say.'

"I patted her on the head. 'That's a good sensible little girl,' I says, 'and now the first thing is to come and help me get supper.'

"Well, I thought I'd seen something of green girls before, but when I took Ella in hand I found out different. I was pretty near discouraged with her sometimes, but I was bound I wouldn't give up, and along towards Spring I could see she'd begun to improve a little.

"One day she says to me, 'Do you know, there's quite a good deal to housework, after all?' and then I knew she was on the road to recovery, as you might say. After that her remarks got more and more interesting.

"'I believe housework agrees with me,' she said another time. And she did look a sight better than when she come.

"'It's as healthy work as there is for a woman,' I says.

"'I think you are right,' she says, 'and actually I don't know but I like it better than anything else I've ever tried.'

"She got so she did her work as nice as could be, and before the Summer was out I paid her $3 a week, and she earned it, too. She'd been planning all through the Summer that when I got through needing her in the Fall, she'd go to the city and take lessons in cooking and try to get to teaching it.

"She was real happy making her plans, and I let her talk, but I had a feeling all along that she wouldn't go. You see there was John Winslow who lived just a little ways from us, and I had an idea that maybe he'd have something to do with Ella's plans.

"After my boarders was gone she helped me with my canning and the housecleaning. When that was done there wa'n't nothing to hinder her going to the city, but somehow she didn't seem in any great hurry to start, and finally one day she come to me all kinder blushing and smiling, and says, 'I've changed my plans a little, Aunt Asenath. I'm not going to the city after all, but I've got a chance to start a kind of housekeeping kindergarten right here in town.'

"Now John Winslow had two little sisters he was trying to bring up, so I see right off what she was driving at, but I pretended not to understand and looked as puzzled as I could, so she had to go on.

"'I'm—I'm going to have a partner in the enterprise,' she says, blushing harder than ever. 'Why, Aunt Asenath! I believe you must be stupid not to understand.'

"I had to laugh at that. 'You little goose,' I says, 'of course I understand, and I'm real glad you ain't going to the city.'

"Well, after she'd been married a year or two, she was kinder talking things over with me, and she says, 'It was the best thing that could have happened to me—my coming here and getting all out of money. Suppose I had found some work here and then had married John, not knowing a thing about housework?

3912 Infant's Petticoat, One Size.

3906 Infant's Slip, One Size.

Why,' she says, 'I firmly believe we'd have been divorced by this time, although John has got a lovely disposition and would put up with a good deal. As it is, I think I make a pleasant home for him and the children.'

"'That you do,' I says, 'and John is a lucky man.'

"And so, Miss Drake, if I was you, I'd make that girl of yours learn all about housework. She'll get to like it by and by, and it may save her from the divorce court later on."

SUSAN BROWN ROBBINS.

Rural Recipes.

Cider Apple Sauce.—Apple sauce made from sweet apples and cider is delicious. Pare, core and quarter the apples, cover them with hot water and stew gently until tender. The water should by this time be quite well boiled away. Now add either sweet cider or a mixture of boiled cider and water, together with as much sugar as may be necessary. Cook 15 or 20 minutes, then cool and keep in covered jars.

Apple Jam.—Use equal amounts in weight of sour apples and sugar. Pare, core and chop the apples fine, and make a clear syrup of the sugar. To this syrup add the apples, the juice and grated rinds of three lemons and a few pieces of white ginger. Boil until the apple looks clear and yellow. For the jelly, the apples need only be wiped clean and sliced, the skin and seeds being left in place. Cover the fruit with cider and cook until soft. Strain through a cloth. To every pint of juice thus obtained add one pound of sugar and boil a few minutes. We like to flavor our apple jelly with rose geranium leaves, using about three leaves to a quart of juice. The result is a delicate, scented flavor, suggesting an idealized combination of several fruits.

Deviled Mushrooms.—Peel and cut into quarters one pound of wild mushrooms and stew them gently in 1½ cupful of water 10 minutes. Then add one-half cupful of cream, a tablespoonful of browned flour and a saltspoonful of mustard, rubbed smooth with a tablespoonful of butter, a half-teaspoonful of salt and half a saltspoonful of paprika. Simmer three minutes, add one tablespoonful of grated horseradish and two tablespoonfuls of tarragon vinegar. Mix quickly. Serve at once.

Cream Peach Pie.—Peel, stone and halve ripe peaches. Line a deep pie-plate with puff paste and lay the peaches in this. Sprinkle with half a cupful of sugar and fit on an upper crust. Have ready a cold cream sauce made as follows: Scald one-half pint of milk and thicken with a tablespoonful of cornstarch rubbed smooth in a little milk (cold). Add two tablespoonfuls of sugar and the frothed white of an egg. Boil together five minutes and cool. When the pie is done carefully lift the top crust and fill to overflowing with the cream sauce. Replace the crust and set in a cool place. Sprinkle with powdered sugar and eat very cold.

THE feature of the Summer meeting of the Wisconsin Horticultural Society this year was the "picnic" day. The young people were delighted, of course, while the old fellows showed plainly that a holiday was an unusual occurrence with them. When we arrived in Madison, after our moonlight boat-ride, all seemed anxious to pour out thanks to some one for the pleasures they had experienced. One man told me that it was the first real holiday he had had for 18 *years!* R. C.

BUSINESS BITS.

THE farmer who has roots this year to supplement his grain ration can be considered either lucky or possessed of a great deal of foresight. Of course it is dangerous to feed roots without cutting them, and no one can afford to spend the time and energy to do it by hand. Better look into the merits of the Banner root cutter. O. E. Thompson & Sons, Ypsilanti, Mich., manufacture it, and will send full information on request.

A JET of steam will kill more microbes than any other agency. Nowadays dairymen consider steam one of the necessities to insure cleanliness. A steam engine has this very strong advantage over all other kinds of power, and, of course, is equal to any other for all kinds of farm work. If you want to know all about steam engines and what they will do, write to James Leffel & Co., Box 101, Springfield, O.

"FOR Cream-of-the-Earth Folks" is the title of a neat booklet issued by the U. S. Butter Extractor Co., Bloomfield, N. J., setting forth the advantages of the Empire cream separators. Certainly the hand-power cream separator deserves to rank as one of the most important labor-savers and money-makers ever invented for the farmer, and the Empire separator has achieved great popularity as an easy-running, close-skimming machine, extremely simple in construction and easily cared for.

WE have been glad to notice in recent years an increasing tendency on the part of people to get back into the country, leaving the crowded cities and towns. Life is likely to be longer, as it certainly will be happier, where there is an abundance of pure air and sunlight, with unrestricted views of hill and vale, river and sea. We feel that the country at large is indebted to everyone who is making any effort whatever to aid this movement. The W. F. Allen Land & Improvement Company, Salisbury, Md., was organized to place on the market good home properties in Maryland and elsewhere. Mr. Allen, who is at the head of this institution, has long been known, and favorably, too, as a strawberry culturist, which brought him face to face with the fact that the cities are crowded with those who are needed by the country, and for whom a country life can do so much. Address W. F. Allen Land & Improvement Company, Salisbury, Md.

Seventieth Fair of the American Institute.

One could scarcely realize the generally disastrous character of the season from a view of the fruits, flowers and vegetables at the seventieth annual fair of the American Institute, held in the Berkeley Lyceum Building, New York, September 24-26. The display was more extensive and of much better average quality than for several years past. Grapes were shown in great perfection and variety by Ellwanger & Barry, Rochester, N. Y., and C. C. Corby, Montclair, N. J. The latter had bunches of native varieties rivaling in size and beauty some of the best glass-grown foreign grapes, but as they were the product of special amateur culture they did not represent the normal character of the varieties as well as the Rochester exhibit. Campbell's Early showed up extremely well, in good flavor as well as size and appearance. Ellwanger & Barry had their usual large assortment of pears and apples. The pears were very fine, while the apples, though well developed, generally lacked color. Some good plums were shown by M. L. Bell, Sparkill, N. Y.; Wickson and Chabot seemed to be the best, though some of the largest plums labeled Wickson were evidently Kelsey. Cornell University had some novel fruits, among which were well-fruited branches of the Buffalo berry, Shepherdia argentea, and a collection of varieties of the European medlar. Smith's Hybrid pear was noted in this exhibit. It is of Chinese Sand pear origin and resembles Garber, but is uniformly smaller. There were no peaches, and but a little prominence was given to Kieffer pears.

The vegetable and farm crop display was notably good. Probably no finer vegetables have ever been shown in the long series of fairs held by the Institute. A large exhibit from F. G. Bourne, Oakdale, L. I., was splendidly staged, the rich colors of the squashes and other cucurbits with the brilliant tints of tomatoes and peppers in variety made an effect but little inferior to portions of the flower section. But little was to be seen in the way of new varieties, though all the standards had been grown to great perfection. More good orchids and foliage plants were staged than we have seen before, and the competition in Dahlias was closer and more extensive than in previous years. A very pleasing feature of the decorations was the large number of dwarf Flame flower, Kniphophia Pfitzerii, from J. L. Childs, Floral Park, L. I. The extreme brilliancy of the compact spikes of this fine variety make it always a conspicuous object.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

THE RURAL NEW YORKER,
409 Pearl St., New York.

MARKET NOTES

ROOTS AND HERBS.—Several readers wish to know where they can sell the various roots and herbs which are used for medicinal or commercial purposes. Nearly all of the wholesale druggists buy small quantities of these herbs for their trade, but there are botanical druggists who are always in the market for anything in this line. One of these dealers is George A. Elwood, 279 Pearl Street, New York. Those having this stuff to sell should write to the regular dealers, giving full particulars as to quality and quantity.

FOREIGN GRAIN PURCHASES.—On September 23 910,000 bushels of corn were bought by exporters. The heaviest sales were in Chicago, but it is understood that most of the grain will be shipped from the outports. No unusual amount of ocean freight accommodation appears to have been engaged for this large purchase of corn, and it will probably be stored at eastern ports and worked off at about the same rate as for the past few months. It is quite likely that this movement is merely an effort to get as much benefit as possible from the cut rates (from 10 to 30 per cent), which most of the railroads from Chicago are said to be making to eastern points. Export oat shipments have been very light for some time. The Russian black oats have been monopolizing the European markets to some extent, as they could be sold at a figure which particularly appealed to the cheaper class of trade. The largest recent foreign sale of American oats was 800,000 bushels for the English army in South Africa.

PROSPECT FOR A BEGINNER.—A reader who has had two years' experience in handling produce in country towns wishes to know what are the opportunities for commencing business in this line in New York City. If he has had no experience in selling stuff in the city he would better go very slowly for a time. If he does know something of the way in which trade is carried on here, has tact in handling buyers, and is willing to work hard and long, he ought to get along fairly well. He must expect sharp competition, and will run across some of the meanest people on the face of the earth as buyers. For a man without knowledge of city trade the better plan would seem to be to work for a time as helper in an established concern. By keeping his eyes open he would get a great amount of experience, with much less cost and worry than if in business for himself. Handling produce in the city markets is a trade just as much as carpentry, steam engineering or shoemaking. There are men in the business here who have been at it 25 or 30 years. They have the advantages of an established trade, and the knowledge gained from long observation of the markets under all conditions, and are thus often able to sell stuff more quickly and for better prices than a new man could get. However, these things should not discourage a beginner. There is a great amount of produce to be sold here, and a new man who will handle his shippers and customers with consideration stands a fair chance of working up and holding new trade. This produce commission business has been so overrun with scamps and scalawags that shippers who have suffered in this way more than ever appreciate a city agent who will handle their produce with reasonable care and make them honest returns. A man of this stamp who will start carefully and master the business will surely make a permanent place for himself. W. H. H.

PROVIDENCE (R. I.) WHOLESALE FRUIT AND PRODUCE MARKET.

BUSINESS FACILITIES.—There are 10 or 12 large houses here; several of the leading dealers have been long in the business, and are able to handle heavy shipments. We have ample service by rail from the South and West and to all parts of this State, and those sections of Massachusetts and Connecticut that are supplied by this city; also direct lines of steamers from New York, Philadelphia and Baltimore, and local boats to all shore places on Narragansett Bay. The trolley lines are now introducing express freight cars, and as the lines are reaching out in all directions, they will be of great service for quick delivery of fruit and produce.

FRUIT PEDDLERS.—Our city fathers recently decided to put a tax on all peddlers as follows: Wagons, $25; sidewalk stands, $15; baskets, $10. It was at first thought that the tax would drive many peddlers out of the business, but there are already over 600 licenses issued. These peddlers afford an excellent outlet for fruit and vegetables, and the bulk of our perishable fruit is sold to them.

PEACHES.—This popular fruit is absorbing attention in the market, and the season is now at its height; while they last other fruit must wait awhile. From 3,000 to 5,000 baskets a day are now being handled by the wholesale dealers here. Prices are somewhat depressed at present, on account of heavy receipts, but have averaged very well for the season on nice, sound, well-packed fruit. The most popular peaches here are white, but extra yellow sells well, while medium to poor yellow drags. This market prefers the 16-quart, round open basket, although the six-basket carriers have been used extensively this season, mostly with peaches shipped here from the South and West. The area from which peaches are sent to this market has greatly extended the past few years, owing largely to the use of refrigerator cars. During the past few weeks, peaches have been received here in carload lots from 10 States, viz: Georgia, Kentucky, Arkansas, Missouri, California, Michigan, Maryland, New Jersey, Delaware and Connecticut, besides those brought here from towns in this State. Up to five years ago the crop of peaches in New England was so small that it cut no figure in this market, but thousands of peach trees have been planted in this State and Connecticut, and many of them are now bearing, and as the quality is good, they are bound to increase. Formerly this city looked to Delaware and New Jersey for its peach supply, but this is now fast changing, as the quality in those States has been poor of late.

FRUIT OUTLOOK.—Grapes will soon follow peaches as the leader, and already there is some demand for them. Several carloads are now en route here from western New York, and some are arriving from the Hudson River section. Concord, Niagara, Delaware and Catawba, in the order named, are the popular kinds. More Concords are sold than all others. The package known as the "pony" basket is the favorite, although the eight-basket carriers are sent here to a limited extent. Apples are scarce; prices will be high. Potatoes are a short crop here; market touched $5.25 a barrel for a short time, but has sagged to $2 on account of farmers all digging now. Prospect good for prices. Onions are firm; market already advanced to 75 and 85 cents a bushel. Indications are for high prices the coming Winter. L. C. E.

Providence, R. I.

AMERICAN POMOLOGICAL SOCIETY.

The Convention at Buffalo.

PART II.

The evening session was a joint meeting with the National Association of Bee Keepers. Fermentation of Fruit Juices by Control Methods was the subject of a paper by Prof. Alwood, of Virginia. He described the different forms of bacteria, and told how they caused fermentation in fruit juices. Control methods consist in selecting cultures which produce proper fermentation. Scientists have already accomplished much working along this line; cleanliness, exclusion of air, and sowing strong cultures, are the means we have of controlling fermentation. Prof. Fletcher, of Ottawa, Canada, followed with a paper on Bees as Fertilizers of Flowers and Fruits. Bees carry Pear blight. Prof. Waite, of Washington, said that he had proved that bees convey the germs of Fear blight, by carrying them to the blossoms in the process of pollenization. Prof. S. A. Beach, of the Geneva Experiment Station, next gave his experiments in spraying trees in bloom. After many experiments he thinks it is not necessary to spray at this time, and does not recommend the practice. H. W. Collingwood read an address on The Pomologist and the Bee Keeper.

Development and Needs of the North American Fruits was the subject of an address by L. Wolverton, Grimsby, Ontario. One trouble, he said, in making up shipments for distant markets, is a multiplicity of varieties. Standard varieties of known quality, in large shipments of a single variety of such fruits, have proved generally profitable. Transportation companies have not always provided the best facilities for transportation. The cold storage has often been defective. Fruit needs to be graded according to some established standard, and then placed in suitable packages. He had good success in shipping choice pears in half-bushel boxes, and apples in one-bushel boxes, to supply a demand from special trade. Prof. Geo. T. Powell, of Briarcliff Manor, N. Y., continuing the discussion of the subject, said that no class of buyers will pay as much for fine fruit as the English, and no others are so critical. One cause of unsatisfactory shipments of apples is allowing them to lie in piles too long in the orchards. Picking at the right time, correctly grading and honestly packing them in cold storage of the right temperature, will solve the problem of getting a profit in shipping fruit. Senator H. M. Dunlap, of Illinois, said he had visited Europe, and had observed the demand for American fruits, of best quality and honestly packed. Especially is this true in France. Maintain the reputation of our fruits, and we have the market. Charles Forster, exporter from New York City, reported a considerable growth in the apple export trade. Our apples are coming in favor in nearly all foreign markets. Grading and packing are the main essentials to success, in shipping all kinds of fruit. Fancy fruit should be packed in boxes of 50 pounds. Steamship companies are studying the subject of cold storage in transportation, and will do all they can for shippers. He told how one shipper had sent Duchess pears in boxes to Liverpool, which sold at $1.43 per half-bushel box, and realized $1,000 per carload.

Lessons from the Fruit Exhibit was the subject of general discussion, and it was the opinion of the majority of the members that five was the best number to place on the plate in exhibiting apples, pears, peaches and the large fruits, while for the smaller fruits, as plums and cherries, 10 was the best number, also three bunches of grapes. Prof. L. C. Corbett, of Washington, D. C., gave an account of apple growing in West Virginia. Prof. Green, of Minnesota, gave an account of fruit growing in Minnesota. He said that after many trials of Russian and other varieties, "We have found a few which are desirable, adapted to our climate. We have a new horticultural building covering more than one acre. We have the largest horticultural society in the United States. We have proved that fruit of suitable varieties can be successfully grown in a locality where the temperature often goes 40 degrees below zero."

The remainder of the session was taken by reading the reports of committees and transacting business. A motion was carried—after a long discussion—that hereafter the papers read at a society meeting should be limited to 10 minutes and discussions to five minutes. The Society's fruit exhibit was displayed in Horticulture Hall at the Pan-American Exposition. The session Thursday afternoon was at this place, and the time was mostly spent in examining the large and excellent exhibits of the Society and the exhibition exhibits.

The officers were reëlected as follows: President, Chas. L. Watrous, Des Moines, Iowa; vice-president, Thos. Meehan, Philadelphia, Pa.; secretary, Wm. A. Taylor, Washington, D. C.; treasurer, L. R. Taft, Michigan Agricultural College. W. H. J.

WE have had a few trees of very fine Burbank and Ogon plums which we sold from our market stand at a good price. We received an average of one cent for three plums all the way through—selling them in one-quart berry baskets. A fine crop of Imperial Gage and Lombard plums (50 trees) is just approaching maturity. I am engaging them at $2.25 per bushel.

F. H. B.

IT is said that ex-Governor Eaton, of Colorado, will receive this year $500,000 income from his farms. He bought 16,000 acres 40 years ago from the Union Pacific Railroad for $1 per acre. This has been improved by irrigation, and is leased to farmers who pay a rental or work the land on shares. There are 5,000 acres in wheat, 4,000 in Alfalfa, and 4,000 in potatoes.

DURING the first six months of 1901, India and Ceylon exported 42,423,250 pounds of tea. This is one-fourth more than for the same period last year. Prices are very unsatisfactory on the common and lower grades, of which there is a large accumulation on the market. Under these conditions it would seem to be useless to attempt to raise tea in this country, where labor is much more expensive than in the East.

Symbols of Success

A vacant chair and a portrait on the wall—strange symbols of success! Yet, in many a home these are the symbols of the success of the man who did not find time to care for his health, or neglected the increasing warnings of disease which Nature gave him. When the stomach is "weak" and food is imperfectly digested and assimilated, it is only a question of time until the break-down comes. The stomach is the very center of vital power and must be kept in health if sickness is to be avoided. Doctor Pierce's Golden Medical Discovery cures diseases of the stomach and other organs of digestion and nutrition. It increases the supply of pure, rich blood, and gives the body strength to withstand the strain put upon it by the struggle for success.

"I was a sufferer from what the doctors called indigestion, but after trying several eminent physicians failed to get a cure," writes Mr. Frank Mericle, of Independence, Jackson Co., Mo., Box 473. "Some of my symptoms were soreness in pit of stomach, fullness, tired feeling, constipation; sometimes soreness would extend to bowels. Some one recommended me to take Dr. Pierce's Golden Medical Discovery, which I did, and after taking only a few bottles of 'Discovery' and your 'Pleasant Pellets' can say I derived more benefit from them than any other medicine I ever tried. I began to gain flesh from the start. Have recommended it to others and will continue to do so."

The sluggish liver made active by Dr. Pierce's Pleasant Pellets.

King Harness Co. 510 Church St., Owego, N.Y.

GRINDS AND CRUSHES Ear and Shelled Corn, Oats, Rye, Etc.
to a medium degree of fineness for feeding purposes. Crusher roll crushes the ears and at end of crusher we place either fine or coarse grinding plates.
$15 for a Crusher and Grinder
FINE PLATES are for ear corn, shelled corn, oats, rye and other small grain, where a good medium degree of feed is wanted. COARSE PLATES are for ear or shelled corn, where coarse chop feed is wanted and for Crushing Ear Corn to prepare it for a French burr or any other mill not having cob crusher. Crushes 25 bu. an hour. Can be run with 1 to 15 h. p. or power wind mill. Is strong and durable, made of steel and iron. Hopper holds full sack of corn.
Latest thing out, revolutionizes ear corn proposition. Send for free catalog giving full description.

Live Stock and Dairy

VALUE OF PEDIGREED STOCK.

In 13 years of breeding Jersey cattle and Chester White hogs it has paid me to have them pedigreed and registered. To most intelligent breeders it is an advantage to know the lines of breeding, especially if they wish to rear their young stock to replenish the herd, which is assuredly the cheapest and best way to procure a profitable working herd at the least possible cost. If we have our stock registered we can trace them back to different blood lines, and know which ones have been producers of profitable offspring, which is one of the most essential points in breeding. But when your stock is not registered, you do not know what to expect when breeding, because you have no direct knowledge of their ancestry.

In breeding, the theory is that "like produces like," or the image of an ancestor; then the more noted animals you have in a pedigree the more valuable the offspring, provided the sire and dam are good individuals. All animals are sold entirely on their merits as individuals. If it were possible for two animals to be alike in conformation then the one with the best pedigree of noted ancestry would be the most valuable on the market as a breeder. The price then would be in accordance to the individual or the breeding to back it up. As regards the difference of price of animals registered or not registered, when we first began breeding Jerseys in 1888, we had but a few registered cows and one sire, and a number of grades which were bred to this registered Jersey bull. The calves that were subject to registry I could sell for more than twice as much as the calves that were not, although they were sired by a registered bull. By all means I would say, if you wish to breed cattle, keep them registered, so you know their ancestry, and breed with some intelligence.

WHEAT BRAN OR MIDDLINGS.

Do Cows Need So Much Protein?

PART II.

The herd, during the period of lactation, which included the Winter's work referred to, gave on an average 7,514 pounds of milk and 360 pounds of butter. This clearly indicated that an average of two pounds of protein per day during the Winter was ample for cows yielding 360 pounds of butter per year. Taking the heifers and the cows in the herd doing light dairy work, and giving the daily protein consumption, and the milk and butter yielded during that period of lactation, none exceeding a calendar year, we have the following:

	Protein.	Milk.	Butter.
Beckley	1.68	5,189	330
Belle	1.76	5,763	332
Olive	1.67	6,317	305
Quidee	1.85	7,420	296
Reddy	1.69	3,908	233
Tricksey	1.56	5,252	314
Average	1.70	5,758	301

This showed that 1.7 pound of protein daily was enough to supply the needs of cows that yielded on an average 5,758 pounds of milk and 300 pounds of butter per year. This naturally suggested two questions: First, did the cows receive more protein than they needed? Second, how much protein does the average common cow need to do her maximum work, both as regards quantity of product and cost of production? The work for the Winter of 1900-1 was planned to throw light on these points. The herd was divided into groups of five cows each, but the results of only four groups are published, because in two of them normal conditions were disturbed. Group 1 received the amount of protein usually prescribed, while Group 5 received corn, barley and oats equal parts, with fodder corn and corn silage for roughage. The other groups were fed intermediate between Groups 1 and 5. Group 5 returned the largest yield of milk, and produced more for the food consumed than did any of the other groups. The experiment shows that with the high protein content in the roughage grown on our fertile farm lands grains furnish ample protein for cows doing ordinary dairy work. The bulletin referred to gives in detail the methods and results upon which these surprising conclusions rest.

To illustrate a point that was brought out very clearly in another experiment immediately preceding the one commencing on February 11 and ending April 21, beginning on November 19 and ending February 10, I submit a table giving the average weight of the cows, the daily protein consumption, the calculated amount of protein needed daily for body maintenance, the average amount of protein available daily for product, the daily average yield of milk, its fat content and protein to a pound of milk yielded, the figures being the average of 84 days' work when the cows gave their maximum yield of milk.

Name.	Wgt. lbs.	Protein daily. lbs.	Protein for product. lbs.	Milk yield. lbs.	Per ct fat.
Betty	870	1.70	1.09	10.03	6.7
Dora	877	1.87	1.25	15.02	6.1
Beckley	839	1.63	1.04	13.44	5.6
Tricksey	783	1.70	1.19	16.78	4.9
Houston	918	1.98	1.34	25.00	5.6
Sweet B.	1,063	2.25	1.51	30.81	4.8
Olive	794	1.63	1.08	27.26	3.
Topsy	1,170	2.64	1.82	44.39	3.7
Lou	1,143	2.14	1.34	38.01	3.7

Average	970	2.06	1.38	29.85	3.9

Betty and Dora are omitted from average.

T. L. HAECKER.

HOUSING AND HANDLING HENS.

Can you give me directions for the interior arrangements of a henhouse to contain 50 to 75 hens? They will have plenty of range in Summer, but of course will be confined in Winter.

H. H.

French Creek, N. Y.

What amount of land is necessary for 500 laying hens? What amount of house room will they require for best results?

Coxsackie, N. Y. H. V. S.

I judge that H. H. is a farmer, residing where a northern climate reigns; that he wishes his fowls housed comfortably and a generous egg yield during the season of high prices. To reach these ends the shelter must be constructed along the best known lines of true economy in time and money. (By "true economy" is meant that which pays best in the long run.) Our farmers are too apt to crowd their henhouses, especially in Winter, notwithstanding the universal verdict of experts, that small flocks are much more profitable; that from 25 to 30 fowls in a flock is enough, and that each lot should have a separate house.

The 75 fowls kept by H. H. will require a floor capacity of about 26x13 feet; a south front seven and a back five feet high. It can be built of 13-foot lumber and under one roof cover at each end a house (6x13), and in the middle their two respective scratching sheds (7x13). The expense of thus dividing the flock is but a trifle extra, and the health of the fowls and their egg yield (other conditions being favorable) will be greatly improved. We favor a ground floor, as the birds seem healthier there, and freer from scabby legs and lice. Clovernook's record is, that this Spring we put 16 Plymouth Rocks in an earth floor 12x12 house. There they have been kept (except on occasional short runs at night), and are perfectly healthy, showing no signs of lice. Their egg record of 80 and 36 eggs per week, without a break since April 1 to September 15 is remarkable for fowls so closely confined and given such slight care.

For a rat-proof house, the following device is highly recommended: Build the frame on posts set a few inches above the ground, the sills (2x4) spiked on after leveling. An inch below its upper edge, nail on six or eight-inch boards. It is claimed that rats have never been known to eat their way under these boards. But one-inch mesh wire netting a foot deep nailed to edge of sills and run down into the trench dug for it, then filled in and the dirt packed down firm makes a still better, cheaper and more durable defence against these and other pests. The entire floor space should be filled in up to tops of sills with earth and packed hard, the end rooms then covered a few inches with sand and the scratching sheds with hay, straw or leaves. An inexpensive covering and a durable one for roof and sides over the boards, is a good grade of tar paper. We used a brand known as "extra heavy felt" seven years ago, and it shows no signs of giving out. The end rooms would best be entered from the scratching shed, a six-pane window on the south end. The droppings board should be about a foot from the floor; nest boxes underneath and roosts above should all be on the north end, where the roof is lowest. A lining of stout building paper for the inside of these end rooms (where boards or plaster are deemed too expensive) adds much to their warmth. We whitewash over the paper. Also add a curtain of matting, old carpet or other thick goods fixed with rings on a rod to slip across the front of roosts on a cold night.

Board up the back and front of scratching shed, about three feet, and from that to the roof inside line with cotton cloth to keep out the snow, and outside with one-inch mesh wire netting. A good but slightly more expensive method is to tack the cloth on frames that on warm, sunny days can be taken out, or swung up against the roof inside. The entrance to the building should be on the south side of the center shed.

If the flock under discussion were from 50 to 500 birds, as suggested in H. V. S.'s inquiry, would advise dimensions of buildings to be 7x32 feet, using 16-foot lumber, for each 50 fowls. (Well-seasoned hemlock answers very satisfactorily and is comparatively cheap.) A good size for outside yards to connect with these houses is 30x130 feet. For a straight, egg-yielding plant of 500 fowls the colony plan and a good-sized farm is undoubtedly the most economical and profitable method of poultry keeping. That is, portable houses for 25 inmates each, and free range. But in our cold climate it is difficult to make them warm, portable and cheap, and so our large plants find stationary buildings for all the year most satisfactory.

F. E. WHEELER.

DAIRY AND FARM NOTES.

I read much in your paper about silos and I mean to have one another year, but a good many farmers and other people are very much opposed to silage, for they say it will make the milk taste, and that it will not keep sweet as long and is not wholesome. They call silage rotten stuff. I would like the opinion of some of the readers of your paper. W. A. W.
Whallonsburg, N. Y.

After an experience dating back to 1883 it seems almost a waste of space to speak of silage and its value. The number of silos that are yearly being built should be sufficient evidence of their success, and yet this one question is still uppermost: Will silage injure the cows, and will their teeth get loose? Will it make the milk, butter and cheese taste, and other kindred questions. I remember a very prolonged discussion in southern Wisconsin, where good crops abound. W. H. Bradley, who was conducting the meeting, made an exhaustive argument, backed by years of feeding. The writer took a hand by telling of his limited experience in feeding 150 animals upon this food, but without a thorough conversion of the multitude. To be honest, I don't know that we made a single convert. I gave them an experience with an old cow that had just attained her majority, having eaten silage for 15 years, and was then a lively old veteran with teeth, having lost only the front teeth in the upper jaw, an accident in youth! It is an old saying that where there is so much smoke there must be some fire, and I know that poor, improperly grown and stored silage will flavor milk. So will any food with a pungent odor. It is to obviate this trouble that our experience profiteth, and the sour odorous stuff is as unnecessary as rotten or decomposing hay and grain. I have observed many times the effect in a locality of such a silo. The whole neighborhood would condemn the system from a single unfortunate experience.

These criticisms and experiences come from the northern latitudes, where a large variety of corn is not easily grown and matured. The questioner is above 44 degrees, about 20 miles north of my home in Lewis County, and unless he lives very near Lake Champlain I should say that the seasons would not be longer than with us. To attempt to grow the large southern varieties, unless he is an expert, would be useless, first from the poorer quality of silage, and secondly from the labor of handling water and indigestible crude material. The greatest amount of feeding value in the least tonnage should be our aim. Corn growing is not a question of latitude alone. I have seen a line fence only divide a large fine growth, uniform throughout the whole acreage, well eared and matured, from a field of uneven growth and maturity not worth one-half the former. These two farmers were 500 miles apart in latitude in corn maturing. I have only to repeat what I said on page 591; that when the corn contained too much water, as ours does this year, the quality of the silage may be improved by drying out some of the surplus moisture, not enough so that air will take the place of water, and thus produce heating and white mold, but enough so that the leaves will rattle. We may have to give it up, however, this year, on account of continuous and excessive rains. At present writing, it looks as though we should be fortunate to get corn into the silo wet or dry. The corn harvester will mire on high land and we are forced to discontinue cutting.

Will silage injure all milk products? I know from a long experience that if of good quality it will not only not injure butter and cheese, and milk for use in its crude form, but the butter and cheese will be as good or better. It is saying a good deal to proclaim that wheat bran, cornmeal and oats, with clover and mixed hay, can be improved upon as a butter ration so far as the effect upon quality is considered, and the same may be said of cheese. But, mind you, the foods above mentioned are not found upon every cow table, and when otherwise, then, in my experience, the silage will give to the milk that peculiar flavor which comes from the grasses in Summer. As to its effect upon the animal, even when fed the first-mentioned ration, I consider it has a special value in keeping the system well lubricated and in a condition more easily to assimilate dry foods.

We have sent all of our butter for a number of years to one firm, and never a pound has been sent without silage in it, yet not a pound has been rejected on account of foods. At the same time we have had to use care that the quality of silage was good. In milk production, our experience is the same for New York shipment, no fault with silage milk; on the other hand, the milk was acknowledged as very satisfactory. The firm which bought has asked for the first privilege of securing the same dairies again this Winter.

If I considered it necessary, evidence of a similar nature could be produced both from our own farm and factory experience, coupled with the experience of practical dairymen the country over. There is another phase of the question, however, upon which my mind is somewhat uncertain, viz., the effect upon condensed milk and soft cheese, that is, Brie, Neufchatel, square creams, etc. It is not necessary to mention firm names, but the correspondence and personal interviews I have at hand. The result of these inquiries is against silage milk. I am writing no new thing when I speak of the position taken by the condenseries, but soft-cheese manufacturers have in some cases objected to it. One of the largest manufacturers in this country, and a very close personal friend, who would have no object in any but honest representation and criticism, writes me: "I don't see why it should be injurious in cured cheese, though I am inclined to think that it is not the right kind of milk for Neufchatel, inasmuch as condenseries condemn it on account of affecting the keeping qualities." I know a private dairyman, a recognized authority, who has made a most perfect Neufchatel cheese from silage milk, selling to a most fastidious New York trade. We have therefore this conflicting testimony from certain manufacturers, from which I am able to draw but one conclusion. Not every farmer has succeeded in producing a perfect silage, and one bad mess injures the whole batch. Business men with more or less capital invested, together with the cost of the raw material, are not inclined to take chances, and so we find them arbitrary and unyielding in their rules, and I am inclined to respect and consider their judgment. I have had some experience as a manufacturer, and I know how easily he suffers loss from milk imperfections.

This question has come to be a serious one from the institute platform. In sections where silage is not permitted, advice has been given from the platform to boycott these factories and force them to use it. I believe this principle wrong, repeating again as I have done before, that our teaching should be the methods that would produce only perfect silage, and when this had been secured, there would be no trouble in using it as a food for all milk products. Yes, my friend, build a good silo, tight walls; if solid and unyielding the form will not matter; fill it with ripe corn in the glaze, and you will not regret your expense. H. E. COOK.

BRIEF DAIRY FARM NOTES.

We are quite in favor of barley and peas for late sowing. They are not killed down by early frosts, and they seem to grow well both in dry seasons and wet. Sow as soon as convenient after haying, using a sprinkling of manure or commercial fertilizer. We get the best results by thorough tillage for a week or two before sowing. Harrow the ground from three to 10 times over before sowing, and the seed will grow all the better for the extra tillage. Last year the Pea louse destroyed the peas, but we are not so badly afflicted here with the louse as to deter us from sowing peas again this year, and I am expecting to save them. Of course they may be sown earlier for early feed, but we use them to feed in the Fall after the frost would have killed the corn. Small use to try to cure them then, but for green feed we like them very much. We get considerable protein into the feed that way, too.

In speaking of one-horse farming on a two-horse farm, I mean no disparagement to the farmer. On the contrary, there seems to be, in some instances at least, much wisdom in the idea. In places where land is as cheap as it is here, hired labor appears to be the most expensive item the farmer has to contend with. The phrase, often quoted, that no one can afford to *pasture* land worth $100 an acre, may be true, but how about soiling on land worth $10 to $15, with labor at $1 a day plus board, and milk worth 65 to 70 cents per can? Manifestly conditions must alter methods, and the institute speaker who insists, as many of them do, that soiling, silaging and feeding purchased grain to balance these carbonaceous foods, is best for all, no matter what the cost and condition of land, or the wages of hired labor, is mistaken, if nothing more.

Those thistles seemed entirely out of place in the oatfield when we were harvesting, and the boys didn't like them when we thrashed the oats. The fact is, I haven't found a convenient place to raise thistles. They will grow though in places, and I purpose keeping an eye on those spots, and when we seed them, sow oats and peas and cut early with a mowing machine and handle with a fork. Cattle eat them well as soon as they are wilted, and this saves their seeding. By the way, oats and peas are proving a very good crop with us. We grow more of them every year, and less oats. The cost of harvesting is less, and the thrashing bill is saved; besides, their worth for feeding is greater, if I am not mistaken.
Delaware Co., N. Y. H. H. L.

Pork-Making in Kansas.

The majority of stock feeders, that is those who feed a great amount of stock, raise but a small proportion of the grain they feed, but raise all they can, and depend upon buying of those farmers who grow feed and grain to sell. The stock feeder expects to buy more or less grain each year. Corn is the main food, with the aid of flaxseed meal, but they sometimes use cotton-seed meal, which is becoming quite popular among feeders. There is no corn sold from a stock farm unless by mere chance there is more than needed. These remarks pertain to the beef feeder almost entirely. The beef feeder, to be successful, aims to have at least 1½ head of swine per steer to follow his cattle to utilize the waste. While swine do not do well on cotton-seed meal alone, if a small ration is used they do not get enough of it to hurt them. A great many feeders buy all of their feed. They aim to feed about all the grain the cattle will eat each day, with plenty of roughage, such as good fodder and hay. We find that good Alfalfa hay is a great aid in producing beef and mutton, as it seems to be a good flesh-producer, and is relished by all stock, swine included. Some beef feeders grind or crush their corn with good results, and labor well paid for.

In feeding swine for the pork barrel, I have found that it paid to give a small quantity of mill feed, such as ship or shorts, made into a slop, and to shell the corn and soak it from 24 to 36 hours in salt water; feed in clean troughs and on platforms or floors. A stone floor would do if it could be kept clean. The stock raiser and feeder is the one who keeps ahead, while the farmer who raises grain to sell has hard work to make ends meet. To feed swine for breeding purposes I find that they should not be fed heavily on corn, but have plenty of Alfalfa pasture, with ship slop and a light diet of corn. Corn is too heating and concentrated; does not produce bone and muscle enough. Corn-fed sows will not produce as nice, large, healthy litters as those fed on a lighter combination of food. R. S. COOK.
Wichita, Kan.

The nearest thing to a certain Cough Cure, is Dr D. Jayne's Expectorant; and it is deceptively cheap; t takes so little of it to do the work.—*Adv.*

HEEBNER & SONS, Lansdale, Pa., U. S. A.

26 Bu. Baskets

AN HOUR with our Wolverine Genred Ball Bearing Mill. Grinds ear corn, rye, wheat, shelled corn, etc., fine or coarse to a very uniform feed, because burrs are brought together very true. The only Sweep Mill that grinds all grain, equal to a burr stone mill.
CAPACITY is large because the mill is 17 in. burrs on this mill revolve three times to each turn of the team, making them equal to 51 in. burrs on most single geared mills. Therefore, we give you the largest capacity and most uniform feed possible to produce on a sweep mill.
RUNS EASY because all friction is relieved by our improved Ball Bearings. Is the largest and easiest running geared mill made (Wt. 675 lbs). Our prices are low because we have no agents. We guarantee this mill to grind 1-3 more than any other 2 horse geared mill. We have 8 sizes of sweep mills $14 25 and up. Thirty other styles of grinders for all purposes. Free catalogue of 15,000 articles. Ask for it.
Marvin Smith Co., 55-59 N. Jefferson St., Chicago, Ills.

ONCE IN A LIFE TIME
is often enough to do some things. It's often enough to buy a wagon if you buy the right kind. The

ELECTRIC HANDY WAGON
lasts that long under ordinary conditions. First the life of a wagon depends upon the wheels. This one is equipped with our Electric Steel Wheels, with straight or stagger spokes and wide tires. Wheels any height from 24 to 60 in. It lasts because tires can't get loose, no re-setting, hubs can't crack or spokes become loose, felloes can't rot, swell or dry out. Angle steel hounds.
THOUSANDS NOW IN DAILY USE.
Don't buy a wagon until you get our free book, "Farm Savings."

THE GREAT PAN-AMERICAN DAIRY TEST.

THE GUERNSEYS STILL LEAD.

What the Figures Show.

The test of dairy cows and breeds at the Pan-American Exposition is still going on, and the interest is increasing. As will be seen from the table printed below, the Guernseys are still leading so far as actual profit in butter is concerned. It seems likely now that they will win the full test, but the margin is still close, and the Jerseys or the Ayrshires may make a final spurt during October and come in ahead. The picture, Fig. 314, page 691, shows how the cows are stalled during the test. They are made comfortable in every way, and a heavy wire screen behind them prevents handling or annoyance. While the question of butter profit has been made the leading one in this test, there are many other lessons that are to be learned from it. When the records are all made up with actual performance and cost of food for each animal, we shall have the basis for a good many valuable facts about dairy cows.

One thing of great importance that the test has already demonstrated is the value of what we may call *performance* in the history of a cow. As a rule, a cow with a good pedigree, and showing in her color and shape what we may call the regular *type* of the breed, is likely to be a good one. Sometimes, however, such a cow is beaten by another that is "off" on type, yet whose mother and sisters are known to be good, rich milkers. An instance of this may be seen among the Guernsey cattle in this contest. When the final selection was made there was a choice between two animals. One had a black nose—a fatal defect in the "scale of points" or pure type. Yet this black-nosed cow came from a family known to be rich and deep milkers. She was one of the best milkers in the barn, yet she was rejected because she was not typical of what breeders claim the breed should be. Had she been selected the Guernseys would now have a far greater lead in the race. Should the Guernseys lose it will be because this grand performer was turned down—largely on account of her black nose!

Again, the Dutch Belted cattle illustrate the mistake of neglecting *performance* for external qualities. It would appear that these cattle have been selected for years with a view to fixing the handsome belt of white which surrounds their bodies. Naturally, with this end in view, a cow with superior milking qualities, but with black spots on this white belt, would be rejected—as was the case with the black-nosed Guernsey. By making this white belt the standard the number of superior milking cows is limited. No man can hope to select his stock with a view to keeping up this *outside* belt and at the same time hope to win any belt on the *inside* performance of the cows. The Dutch Belted cattle are close to the tail of the race, while their cousins, the Holsteins, with black and white mixed all over them, but with the blood of their best cows well mixed inside, are near the top.

The Ayrshires, too, are doing surprisingly well in this test. As butter producers they rank with the Jerseys and Guernseys, while as milkman's cows they are considered by many as equal or superior to the Holsteins, for they give a quart of good milk for little money. Here comes the question of *performance* again, for these Ayrshires trace back to herds where for many years breeders have been quietly but carefully selecting their breeding stock, not by color and shape alone, but by the report of the scales and the Babcock test. This thing crops out again and again as the pedigrees of these cows are investigated. The good ones are from working families, with mothers and sisters known to excel at the pail. Most of these superior cows follow closely in their shape, color and general exterior what the breeders call the true type of the breed, but not always. The test seems to demonstrate that for most American farms the smaller cattle are to be preferred. The Brown Swiss cattle make a comparatively poor showing; in fact, it is hard to say just where and under what conditions these big cows would be likely to pay better than others. The Holsteins take high rank in the test, but they are tremendous eaters, and it is necessary to handle a large amount of their milk in order to obtain a pound of butter. The big animals have been praised because they are able to turn over large quantities of coarse roughage, and make milk and butter out of a cheap ration. In this test, however, their grain bill has been very high, and the figures seem to show that the medium-sized cow of good breeding will make a more profitable use of both fodder and grain. The Red Polled cows are, in the opinion of many good judges, the nearest approach to the true general-purpose animal that we have in the country. They give a good mess of fairly rich milk, and turn off a fine carcass of beef when required to do so. Their performance in this test has surprised many farmers who did not know what this breed is capable of doing. They extract from their food a good proportion of butter fat without laying on too much of what we may call butt fat.

AN AMERICAN TREKKING OUTFIT. FIG. 311. SEE WOMAN AND HOME, PAGE 699.

Mr. Van Alstyne, the superintendent of this test, was asked what cow seemed best adapted to the needs of what we may call the ordinary dairy, and the fixtures and conveniences found there. He said that the facts developed show that the Channel Island cattle, Guernsey or Jersey, are best.

"Why is that so?"

"Because the butter from cows of these breeds is harder, firmer and of better natural color than that from others. This hard butter, of naturally good grain, is easier to make and keep under the conditions which prevail in the ordinary dairy, where frequently the most improved fixtures and apparatus are not to be found. It is an advantage, too, in such small dairies to have rich milk. This requires fewer pans or cans, and much less time is required in milking or handling the milk and cream."

The picture of the cows in their stalls, Fig. 314, page 691, shows how comfortable they are. Several years ago Prof. H. M. Cottrell, who was then superintendent of the Ellerslie stock farm, said that to get high profit out of a good milch cow he would turn her into a large, roomy box stall, feed and water her there, keep her clean, and not let her out until her

years of service were ended. Her calves would be born and her milk produced right in that comfortable stall or room. At the time some practical cow keepers were inclined to laugh at such an idea, but it is now coming to be understood that a cow does not need as much exercise as a prize fighter in order to fill her pail.

Breeds.	Milk, lbs.	Butter, lbs.	Value of butter.	Cost of feed.	Profit.
Holstein	30849.8	1151.61	287.85	123.55	164.84

H. W. C.

FRUIT VARIETIES FOR PENNSYLVANIA.

I eontemplate buying 15 or 20 aeres of land near here, that is within five or six miles. I would like to set it out to such apples, plums, peaehes, pears and quinees, of good quality, growth and bearing, as will in eight or 10 years furnish a net ineome of $400 or $500 per annum in ordinary seasons. I should expect to rent it free to a man in return for its care the first few years. Will you advise as to the suitability of the following seleetions? 1. Would the following be a good seleetion of apples, one-third to be Summer and Fall and the remaining Winter sorts: Starr, Red Harvest, Melon, Delieious, Missouri, Grimes, Stayman, Commeree? 2. Can you tell me whether the following kinds of apples are good growers, bearers and generally desirable and reliable: Champion, Senator, Blaek Ben Davis? 3. Are there more desirable apples of the same season? 4. Is the Florenee erab a good one? 5. Would the following varieties and suecession of cherries be a good one? If not, what ehanges would you suggest? Riehmond, Montmoreney, English Morello. 6. Would the following pears be likely to do well in the vieinity named below: Koonee, Boussock, Fame, Garber, King Karl. Krull? 7. Would the following plums be likely to do well: Amerlean Eagle, Red June, Lombard, Gold, Wickson? 8. Are the Van Deman and Missouri quinces good?

Easton, Pa. READER.

It is not unreasonable to expect an annual net income of $500 from 20 acres set to orchards of good fruits. In renting land set with young trees to tenants it is almost certain that they will not properly care for the trees unless there is a very carefully planned contract made to cover this point, and constant supervision to see to its enforcement. The tenant usually looks out for his part of the profits, which is the growing crop, and the growth and protection of the trees is a secondary matter with him. The owner should have such provision made as will secure the trees the first and chief attention, no matter what emergency may arise. During the rush of Summer work there are likely to be times when something may have to be neglected, and it should not be the trees.

1. Replying to the question of varieties of apples suitable to plant in Pennsylvania, and particularly those mentioned, it may be said that one-third of the number of Summer and Fall kinds seems to me far too great a proportion for a commercial apple orchard. Early apples rarely pay so well as the Winter kinds. Starr is a fairly good but only a second early apple. It is quite large, greenish yellow, and of fair quality. Red Harvest I have never heard of under that name, but Red Astrachan may be meant, which is an early kind of fairly good quality and popular in market. Melon is a very good Fall apple. Delicious is too new to say much about, for it has not been tested except in a very few places. Missouri is an excellent kind for the regions where Winesap succeeds, which is mainly in the Central and Western States, and it may be all right in Pennsylvania. It is a very early bearer, keeps well, is bright red, and of fair quality. Grimes is one of the very best in quality of all apples, is rich yellow, of fair size, keeps only until late Fall or early Winter, and bears well. For family use or fancy market it is excellent. Stayman is a new variety that is superior to Winesap in size and in habit of tree, but otherwise almost identical with that old standard. It is worthy of trial in Pennsylvania. Commerce is a new kind that is but little known; York Imperial is an apple that I would surely plant there. 2. All these varieties have other names which have been approved by the pomological authorities instead, but they have not yet been sufficiently tested to warrant any definite decision as to their value generally, except the last one named, which is thought by most fruit men to be the same as Gano. It is about the same as Ben Davis, except that it is a deeper and more suffused red color. The other two have been fruited but little outside of the region in Arkansas where they originated. I would not think it wise to plant them more than experimentally until they are better known. 3. Yes, there are certainly other apples that are far safer to plant in Pennsylvania, and perhaps they are far better in several respects. York Imperial is one, as has already been said, and so is Stayman. Jonathan is another which I would prefer. Rome Beauty is also very desirable. 4. Florence is a good crab apple, ripening about mid-season.

5. Yes, they would be very good, because Richmond is very early and a dependable bearer, Montmorency is a little later, and English Morello quite late. All are good sour cherries. Of the sweet cherry class the Tartarian, Napoleon and Windsor would be among the best. 6. Yes, so far as I know them I think the pears named would be good. Koonce and Krull are both rather new, but Boussock is an old and well-tested Fall pear of high quality. Garber is another rather new kind that is much like Keiffer in tree and fruit, but earlier in ripening by over a month. It is not high in flavor, but is a sure bearer. Fame and King Karl I do not know.

7. Yes, all of the plums mentioned will succeed in Pennsylvania. American Eagle is one of our native

A WESTCHESTER CO. (N. Y.) CORNFIELD. Fig. 312.

kinds, and is very hardy and productive. Red June is of the Japan type and very early, but not high in quality. Gold is a new hybrid of Burbank's origin, having both American and Japan parentage. It is a fairly good plum, but nothing extra, being only of fair flavor and very watery, but is handsome yellowish-red when fully ripe. Its size is medium and almost round in shape. Wickson is also of Japan type, and is rather large, heart-shaped, handsome red and of good quality. Lombard is an old standard of the European type, that rarely fails to bear. 8. The Van Deman quince is one of Burbank's new creations that has been tested but little, and, I fear, it is not going to prove so early and valuable as the Orange, which is our old standard. Missouri is a good variety, but not superior to the Orange, as I have seen them both.

H. E. VAN DEMAN.

ROOT-PRUNED TREES IN MEXICO.

On page 482 of The R. N.-Y. Mr. Stringfellow takes exception to my statement that the success of root pruning is "merely a question of latitude," and says: "It is simply a question of moisture, not latitude."

SOME BACKYARD PRODUCTS. Fig. 313. See Page 693.

As proof, he gives the failure of his 3,000 trees, due to drought, and the success of the trees at Hope Farm and other places in the North. That, however, doesn't disprove my statement, but only proves that moisture is absolutely necessary for the success of root-pruned trees. It further proves that this is a weak point in the system of root pruning. Mr. Stringfellow closes his article by saying: "So don't be discouraged if root-pruned trees do not do as well the first year as you think they ought to." Here he admits, that under certain conditions (and such conditions are not unusual in the North), the root-pruned tree may not do well the first year. Such being the case, what is to insure the tree against winterkilling, should a severe Winter follow? Certainly the addition of water will not, and therefore Mr. Stringfellow's statement that the success of root pruning is "simply a question of moisture" is too narrow.

Anyone who has ever traveled from the North to the tropics cannot have failed to notice how much more readily and abundantly vegetation grows the farther South one gets. This is not due to an increase in moisture (although that may also be a factor), but to climatic conditions better suited to luxuriant growth, leaving out of consideration, of course, places which, on account of high altitude, etc., cannot have climatic conditions normal to the latitude wherein they lie. Bearing these facts in mind, it is not difficult to see why a root-pruned tree, robbed, as it is, of a large part of its vitality, will grow better in a locality with favorable climatic conditions, than in one subject to conditions inimical to the growth of the tree. I therefore think that I am entirely justified in saying that the success of root pruning is "merely a question of latitude." Certain it is that that statement is much more comprehensive than Mr. Stringfellow's.

To show to what extent root-pruned trees are set out here in the tropics, I will give a few figures concerning the work done on one of the plantations. The object of this plantation is to plant 500,000 coffee trees and about 150,000 rubber trees. The coffee trees are being put in at the rate of 150,000 a year, and in order to accomplish this, the manager bought up all the old coffee nurseries he possibly could. The trees in these nurseries varied in age from two to five years, and when prepared for transportation were pulled up and cut off so as to leave about six inches each of trunk and root. When these stubs arrived at the plantation an additional two inches was cut off from either end, leaving about four inches of trunk and four inches of tap root free from fibers. These stubs were then planted in holes driven by a pointed stick. Not only did the stubs grow well, but they made trees superior to those grown from unpruned nursery stock, because they branched low, a very important feature in a coffee tree. Rubber trees, though much more delicate and unable to stand much transportation, were successfully planted in the same way.

Now when apple trees in Canada can be set out in a manner similar to this, even though the rainfall be supplemented by rational irrigation, then will I be ready to accept Mr. Stringfellow's statement that the success of root-pruned trees is "simply a question of moisture." I do not mean to say that root-pruned trees cannot be planted in the North, but I do say that such a system is more hazardous in the North than is the old system. H. L. TROTT.

Coatzacoalcos, Mexico.

WORK OF THE 17-YEAR LOCUSTS.

Several weeks ago a writer in Virginia inquired about protecting a young peach orchard from the Cicada, or Seventeen-year locusts. I have seen these locusts on the wing five times on the same farm. In 1846 I planted an apple orchard. As the locusts appeared that year they began to deposit their eggs in the trees. I cut a lot of green rye straw, and set it up around the trees, and held it in place by tying with twine. Two trees were set in an old orchard, and left unprotected with straw. It was several years before they recovered from the damage done by the locusts. From my observations I learn that peach trees and all other trees that exude gum are not much harmed by the locusts. The peach grows so rapidly that the young locusts are in danger of being shut in by the gum, and new growth of wood. The young locusts emerge from the twigs of the trees in about six weeks. I have seen them as they came forth from trees; they are very small. It is now four years since their last visit here; they are not yet large enough to be seen without close examination. In about seven or eight years their body will be as large as a grain of wheat. With us they come from the ground the first week in June, or about the time the lightning bugs appear on the wing. I have examined them when dead; while some of them are filled with a substance resembling dry ashes others are hollow with no internal substance. The English sparrows destroy them in vast numbers. A correspondent of another farm paper, living in Athens Co., O., observed an orchard that had some woodland near it. The locusts made frequent efforts to fly from the woods to the orchard; the sparrows met them half way, and took them on the wing. The observer said he did not see a single one reach the orchard. S. B.

Crescent, O.

I doubt whether the rye straw would afford any protection to young trees from the deposition of their eggs by Seventeen-year locusts, but the notion regarding the exudation of gum from peach trees is a sensible one. It has also been recorded several times that the English sparrow eats the locusts. On the whole this correspondent's observations are interesting and valuable. M. V. SLINGERLAND.

A TWO-STORY CORNFIELD.

Harnessing the Old Sod.

On September 14 I saw on the farm of Heman Clark, Port Chester, N. Y., a three-acre field of corn averaging 12 feet in height. There were many stalks 14 feet high. Fig. 312 shows a small portion of this field. The man standing by the stalk is six feet tall. The apparently short stalks showing in the background were in a hollow about 15 feet in the rear.

Mr. Clark has made a study of corn for many years. He has spent considerable time in the West in railroad building and the construction of irrigation plants, thus meeting farmers in the great corn sections, and having an opportunity to observe many varied methods of handling the crop. To travel through this cornfield was like going into the woods. While the stalks were enormous, both as to height and size, there was something still more interesting, the large ears which hung over into the row, and would have made walking difficult if they had not been so high as to be out of the way of a man's head. I saw very few stalks which did not have one fair-sized ear.

The land about Port Chester is far from being prairie. It is rough and hilly, quite like much of western Massachusetts and Connecticut. The process by which Mr. Clark turns one of these old fields into such a forest of corn is an interesting one.

"This field must have been in fair condition before being plowed for corn?"

"It was an impoverished meadow, no longer producing hay enough to be profitable. It was what is known as 'run out,' although there was a thick, heavy mat of sod."

"When was it plowed?"

"Late in the Fall. From the middle to the last of October is the proper time. We plowed it about nine inches deep."

"How was the field handled in the Spring?"

"First we put on a dressing of well-rotted stable manure. That three-acre piece alone had about 20 loads thrown on broadcast. Then we planted the corn."

"Without replowing, disking or harrowing in any way?"

"Yes; what we consider a very important part of our system is letting the soil entirely alone until midsummer, when the sod yields well to the cultivator. We leave the furrows just as they lie when turned over in the Fall. Of course the field is well plowed, so as to be reasonably smooth. A line was drawn across the field as a guide in planting. The hills are four feet apart each way. If this variety of corn is planted any more closely the earing will be inferior. We try to put the hill as nearly as possible at the edge of the furrow, where it laps over on to the next one. The rains wash more plant food from the manure down into the soil at these points than at others, thus getting it within easy reach of the young corn roots. The corn is planted about three inches deep, and a little earlier than under the system of Spring plowing and harrowing. There is but little danger of the corn rotting in the ground on account of cold rains. It does not stand in the water, as the furrow lies up loosely, and there is good drainage underneath."

"How many times did you cultivate?"

"Only twice each way, first when the corn was about eight inches high and next when half way to the horse's back. If further cultivation is done, the corn roots, which by this time cross the rows, will be damaged."

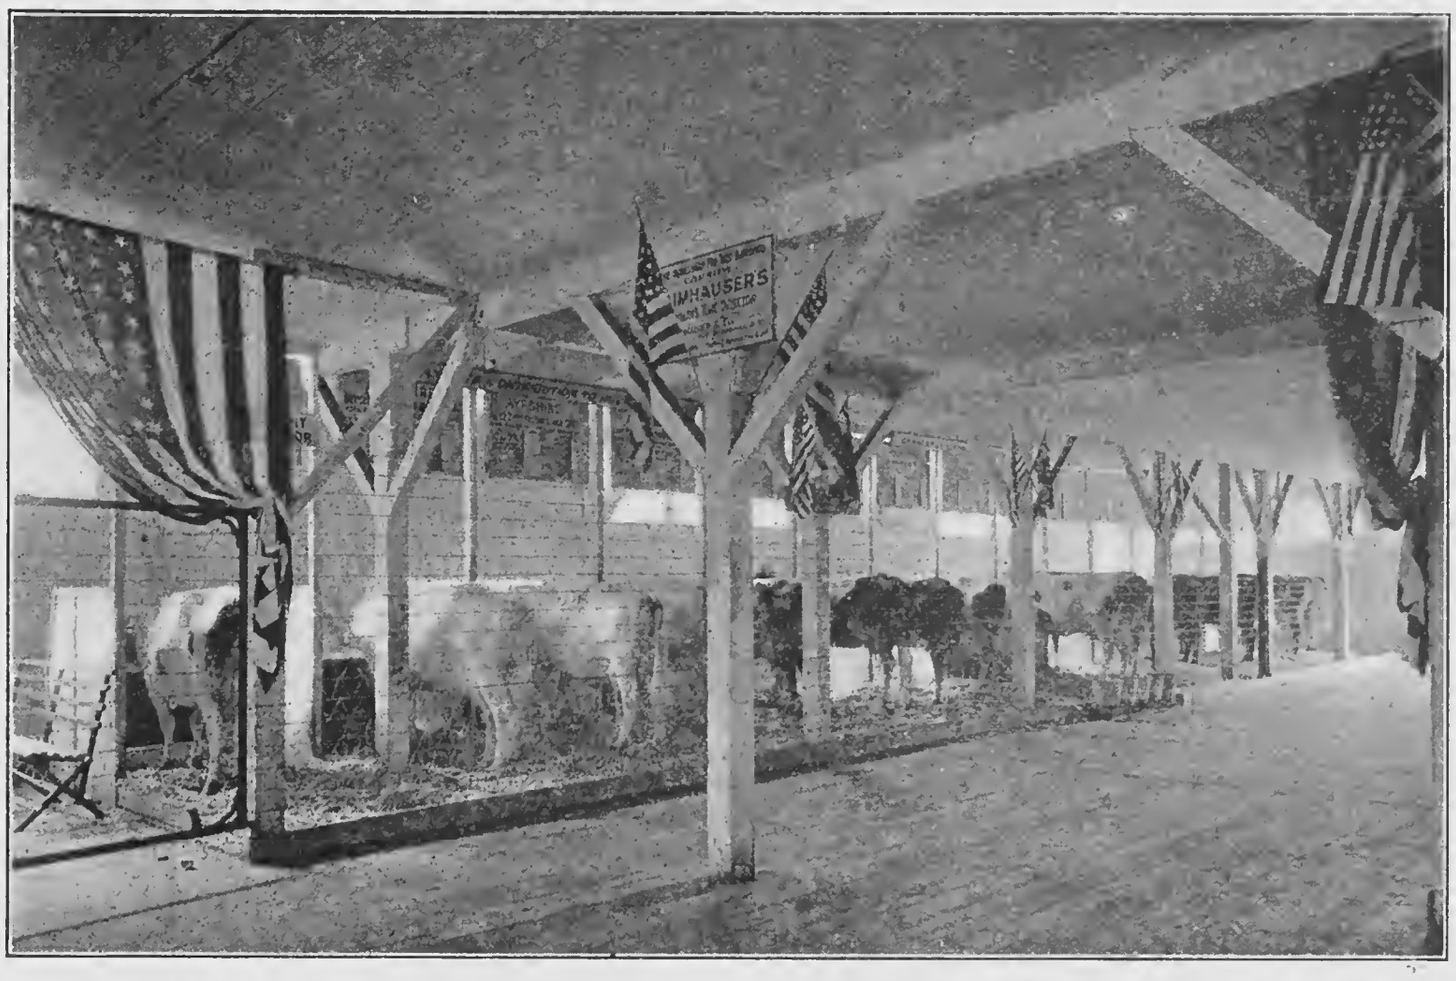
"What variety of corn is this?"

"It originally came from the West. By selecting the most desirable ears for seed for 10 years we now have a variety which, although growing very large, is earlier than many eastern native sorts, and yields from 80 to 100 bushels of ears per acre."

The ground, although so little cultivated, was free from weeds. In fact, such a swamp of corn is a discouraging place for weeds, as it treads on their toes and shuts out all sunshine. As the corn was fit to cut by the middle of September, it would appear to be early enough for ordinary seasons. It often happens that the whole month of September passes in this locality without severe frost.

Mr. Clark has kept separately a plot of half an acre, a fair average of the field. This will be husked and shelled by itself, and the exact yield given in THE R. N.-Y. later. The stalks will be turned into hay by being run through a shredder. This operation will be something like shredding cord wood, and certainly thoroughly test the machine. After the corn is removed, rye will be sown, and the field seeded to clover and Timothy, receiving a light dressing of manure, while another run-out sod field is being plowed for next year's corn. Mr. Clark says that he has not seen in Kansas any finer corn than some crops he has raised on old sod fields under this system. He would not attempt it on anything except sod, however. Unlike many plans for raising large crops there is in this no heavy fertilization, and less work is done than where the corn is handled in the ordinary way.

The essentials of this method are: Fall plowing; a top dressing of rotted manure in Spring; early planting, and moderate cultivation. Horses and heavy wagons are kept off the field as much as possible. Every time a plowed sod field is tramped over with a team the sod is packed down harder on the bottom of the furrow. This is particularly true of the heavier lands. The surface may be made mellow by harrowing, but, five inches below, the soil becomes packed down harder than before it was plowed. When corn is allowed to grow in the soil as the plow leaves it the roots find plenty of mellow earth below, and feed on the decaying sod, which, lying loosely, stores up moisture and plant food better than it otherwise would. These are some of Mr. Clark's arguments for this method of corn culture. The keynote of it all seems to be that the decaying sod is handled, or rather left without handling, so that the corn roots get the full benefit of it. This looks reasonable, and the large yield of corn and fodder backs up the argument strongly. As no extra labor and expense are required, the plan is certainly worth trying, at least on a small scale, by those who have sod fields to plow and are interested in corn growing. W. W. H.



WHERE COWS IN PAN-AMERICAN DAIRY TEST ARE KEPT. FIG. 314. SEE FIRST PAGE.

MOLES AND SQUASH BUGS.—I have just been reading in THE R. N.-Y. about ground moles, and having had a good deal of sad experience with them, I cannot refrain from telling how I rid my garden of them whenever they appear. One Summer my garden was suddenly overrun with them, and my vines were being killed by their digging under searching for worms. I take small bits of lean raw beef, cut half way through, and in the slit place arsenic powder half the size of a grain of wheat, then fold the meat together again and put it in holes where the moles come up to the surface, or open their runway and drop a bit in, letting the earth fall back over it to prevent cats or birds getting the meat. The moles are both killed and buried. I find this a much easier and quicker way than a trap, and it was and is perfectly successful. Another thing I notice in this same paper, and that is, reference to Squash borers. I have found that a handful of wood ashes, with or without a little Paris-green, thrown down at base of plant will effectually keep out the borers. If they get in before anything is done, cover the joints of the vine with earth, and new roots will then form, and sustain the plant. Not a bad thing to do when a vine begins to run anyway. L. B.

Michigan.

CATCH OR COVER CROP.

Oats and Canada Peas; Experience With Rape.

THE R. N.-Y. desires me to tell of my experiences with the different sorts and kinds of cover crops to act as a Winter mulch, and afford humus for the succeeding crop. In reply I would say that these experiments have been going on a dozen years, and with many kinds of crops, and while I have learned some things, not all of the trials have proved satisfactory. In a measure rye is the surest crop that I have tried on the corn stubble, but, like all other crops, the weather in the Fall is the greatest factor in the problem, for it is the Fall's growth that makes a success or failure. For two years past the dry Fall has about prohibited the growth of anything, being far from satisfactory before Winter, and as I want corn land plowed early so to Spring-fallow the land, and kill out weeds before planting, it does not usually give the rye much chance to start in the Spring before plowing. I have had two unpleasant experiences with large rye plowed under for corn. Dry Summers and the rye made a "joint" in the soil by its refusing to decay; it shut off the moisture supply, and both crops where the rye was used were far inferior to other sections where there was no rye and the same tillage. Then I think rye is a great consumer of soil moisture, and as a consequence when the time comes to plow the land is very hard and lumpy, and difficult to get into good tilth. As the substance of rye is mostly water and starch, it is far from the best crop for green manuring. Oats and Canada peas when the Fall is favorable, make a fair crop to cover with, and stand lots of cold and freezing weather before they succumb; as many have noticed about the volunteer oats in the Fall wheat. The peas will live—many of them—through the Winter. When the season is favorable, and the oats and peas can be got in by September 20, they will make a fine growth, and fill the soil thickly with their roots, and one will find a large amount of vegetable matter besides the roots to plow in in the Spring, but if the Fall is dry the crop will be small, often very small.

For a midsummer crop nothing equals the cow pea, and its growth in 40 days is wonderful, especially if 200 pounds of S. C. rock are used per acre. Last year our experimental plot grew in 45 days as large as we could well plow under. Three years ago our late July cow peas were plowed under in September, and the land sown to rye, which in turn was plowed under in April, and it proved to be one of my best cover crops, but it is difficult to get much growth out of them after the corn is cut and cool nights are the rule. With us Crimson clover is little if any better than Red clover sown among the corn, with the chances that more of the Red will live through. Last season we experimented with dwarf rape, and got some good stands on the experimental plots, and shall repeat them on a much larger scale this Fall. The rape, whenever sown, made a fine growth, and the last sowings grew to be nearly two feet high, but where the rape is sown late after the corn, it will do no harm, but probably it would be better to sow nearly double the ordinary amount of three pounds per acre. That which we sowed last at the rate of six pounds (42 cents worth) made a mat as dense as heavy clover, and mostly lived through the Winter, sprouted up from the roots, and when plowed under, made a great mass of humus. Where the silage corn is growing on its remains the corn is a dark green, and is fast outgrowing any other section of the field. Owing to the 32 days of heavy rains in June, this plot was not planted until July 3, and it is now fully eight feet high, and has not heard that a drought is seriously interfering with corn growth, and the other pieces on the rape are making fine and rapid growth, all of which convinces me that rape may be made to play an important part in making a strong and vigorous plant to cover our soils, that would be otherwise left naked during the Winter, a serious matter in our semi-rigorous Winters, where rainstorms are quite as common as the snows. What pleases me with the rape plant is its deep-rooting habit, and where it is sown thickly, it completely fills the soil with good, strong, and well-fibered roots. What it might do on the sandy lands I cannot say, but I was so well pleased last year, that a bag of rape seed is now on hand, and will be duly sown on the stubble lands this Fall. JOHN GOULD.

Northern Ohio.

Top-working Crab Apples.

G. H. B., Gasport, N. Y.—Would it be advisable to top-graft Whitney crab apple trees to standard apples, such as Baldwin, etc.? I am told that they are a poor tree to graft into. I bought a place on which an orchard of Whitney crabs was set a year ago. What would I better do with them?

ANS.—I am of the opinion that the Whitney crab apple would grow too slowly for such kinds as Baldwin, and that the union made by grafting would not likely be very good. Why anyone would be foolish enough to plant a lot of trees of this variety in western New York is more than I can understand, as it is only desirable for the northern prairie States, where a very hardy tree is necessary. The fruit is considerably larger than the ordinary varieties of crab apple, but it by no means takes the place of a good apple. If the trees are not planted too close together it might be well to graft them to Oldenburg or some other very early-bearing variety. They would soon be profitable, and between them plant other good trees, in the end cutting out those that are already there. H. E. V. D.

Some Troubles With Fruit.

J. Y. P., Hudson, N. Y.—1. Wilder Early pear a few years ago was much lauded as a prolific bearer, fruiting young. With me it grows tremendously, but has never blossomed. Four-year-old top-grafts have never shown a flower. Is it any good? 2. Can you tell me anything about the history or value of the Sterling pear? With me it bears every year profusely, but I fail somehow to market it to advantage. 3. Is it a fact that York Imperial apple is always injured by cold storage causing scald? 4. Have had Bismarck apple several years waiting patiently for the promised wonderful returns. This year I had one miserable little apple. Is the thing any good? 5. The Koonce pear will not grow for me. What is the matter with it? 6. What about the Van Deman quince?

ANS.—Our friend J. Y. P. seems to have a multitude of troubles, but this is really nothing wonderful, because nearly all of us have similar experiences. Some of our fruits will not bear, and others, when they do bear, are disappointing in one way or another. I hope others who may read this will add something that will be a benefit to all of us. 1. The Wilder Early pear I have seen growing in a number of places. It has nearly always proved productive at an early age, and I am inclined to think that J. Y. P. may not have the true thing. However, it sometimes occurs that trees or grafts may grow so vigorously that they will not bear early. Under such circumstances cutting back in midsummer is likely to produce fruit buds. 2. The Sterling pear I have never fruited and do not know from observation about its bearing qualities. It originated in Livingston Co., N. Y., and the tree is said to be upright and vigorous in habit of growth. The fruit is of medium size and rather flat or round in shape, much like the Sheldon, but is only very slightly russeted, and usually has a crimson cheek. The flesh is rather coarse, but juicy and sweet, and may be properly considered a good pear. Its season is about the first of September in New York. 3. The York Imperial apple is not always injured by barrel scald when put in storage, but it is faulty in this respect, and I have heard cold storage men within the last few months speak quite discouragingly of it. However, it is an excellent apple all things considered. 4. There are conflicting reports about the Bismarck apple. Some say that it is a most excellent bearer, and that the apple is large and of fair quality; while others think it is very poor. I am inclined to that belief from what I have seen of it, although I think it bears well. 5. This is the first complaint I have heard of the Koonce pear being a poor grower. It may be that this is more common than I am aware of, and I should like to hear from others about it. 6. The Van Deman quince is a new variety originated by Luther Burbank, of California. It has only been tested for a few years, but, so far as I know, it is a good grower and fruits at an early age. The fruit is not so early in ripening as that of the Orange quince, and not so good, I fear.

H. E. V. D.

Peaches for South Jersey.

G. A. L., Vineland, N. J.—I intend to set a peach orchard this Fall, and would like advice concerning varieties that are highly praised by a certain nursery company, but are not catalogued by other companies. Would the Alton, Carman and Mamie Ross be better than the Mountain Rose for early? Would Worth be as good as Elberta for medium and Poole as good as Chairs for late?

ANS.—The Alton peach I do not know, but the Carman and Mamie Ross are both excellent varieties, and I think they would do very well in southern New Jersey. In fact, they are both growing in a number of the Northern States, although they originated in Texas. They are better in quality than Mountain Rose, and of about the same season of ripening, and I think them fully as good, if not better than this variety. Worth is another peach which I do not know, so I cannot make any comparison between it and Elberta. Poole is a good peach, but I have never seen it tested beside Chairs, hence I cannot tell whether it is better than that variety. However, I may say that Chairs is a most excellent peach, ripening shortly after Late Crawford, although in some cases it seems to ripen almost exactly with that variety. If a yellow cling peach is desired Henrietta will be found very good. Of the white flesh varieties I know nothing which is superior to Heath Cling for a late family variety, unless it is Ringgold, which is also sometimes called Wilkins. This latter is a seedling of Heath Cling, and is somewhat larger, but otherwise it is almost a reproduction of the old variety. If a freestone is desired Cruthers is one of the very best. The only thing against it so far as I know is that very few of the nurseries as yet have it in stock, but they ought to be urged to get it.

H. E. V. D.

Fruits in Southern New York.

M. K., Liberty, N. Y.—1. I am contemplating the setting of a small orchard. Would you advise Fall or Spring as the best time for setting? I think of setting for family use and also for market. 2. I want three rows of pears, eight trees in each row. Taking our location into consideration, what three kinds do you think would be the most desirable, as I had thought to set three kinds only, and eight trees of each variety—24 trees in all? 3. Do you think peaches would succeed here? If so, what kinds would you advise planting? 4. I also think of setting a few plums, cherries and quinces, perhaps 10 or 15 of each. What varieties of each one would you advise for our section? 5. What do you consider the best strawberry to grow for market? I think I could market most of them here, and am four miles from the village.

ANS.—1. I think Fall planting would be very good in the region mentioned, but perhaps not better than if it were deferred until Spring, unless there should be a better opportunity to do the work at one time than at another. I like Fall setting of trees wherever the climatic conditions are favorable to it, because the ground is usually in better condition than early in the Spring. The roots get well settled into the ground, and often callus over and make tiny rootlets ready for an early start in the Spring, and sometimes the trees can be bought more cheaply in the Fall than in the Spring. 2. In choosing three varieties of the pear I think the Bartlett should be one, the Seckel another, and for the third I would choose Bosc. The latter should be top-worked on some strong-growing kind like Clapp or Kieffer. 3. Although I have no personal knowledge of the conditions in Sullivan Co., N. Y., yet I feel quite sure that most varieties of the peach will do very well there. I would recommend M. K. to try Mountain Rose, Elberta, Champion, Chairs and Heath Cling. These varieties would give a reasonably good succession for family use. 4. Of plums I would suggest Abundance and Burbank of the Japan type. Fellenburg, Yellow Egg and Monarch are very good of the European kinds. Among the damsons French and Farleigh are among the best. As to cherries, the Richmond, Montmorency and English Morello are among the best of the sour kinds. If sweet cherries are desired Tartarian, Napoleon and Windsor are good. The best of all the quinces, so far as I know, is the variety called Orange. 5. Local conditions such as soil and climate have so much to do with the behavior of the different varieties of strawberries that it is almost impossible to say just what one is best. Indeed, sometimes one variety is good one year, and the next another is better. There are very many good varieties, and I would not suggest the planting of only one kind for market, and certainly not for family use. In a general way it may be said that Beder Wood, Warfield, Marshall and Gandy make a very good succession. H. E. V. D.

Peaches and Pears for Long Island.

What kind of peach and pear trees have proved most satisfactory on the south shore of Long Island? To what extent should peach trees be pruned? After 15 years' satisfactory yield, will it avail anything to endeavor to get further results from a tree? I know that Mr. Hale has accomplished some very wonderful work with old trees in Connecticut, and I am very desirous of applying the most intelligent methods possible.

ANS.—Although about all of the good varieties of the peach and pear do very well in the southern part of Long Island, the Elberta is one of the best peaches for general use there, and the Bartlett is about the same among pears. Blight is the only serious fault of the latter. Peach trees should have their young wood cut back very severely every year in order to keep it fresh and healthy, and that the trees may be close headed, and not with long and straggling branches that bear only at their extreme ends. Very old peach trees have sometimes been benefited by severe cutting back, high manuring and thorough tillage. If the trees mentioned are not in very bad condition they might be profitably handled, for 15 years old is not too great an age, provided borers and neglect have not ruined them. H. E. V. D.

Vegetable Plants
CABBAGE AND LETTUCE.
Leading Varieties. Cheap in large lots.
J. S. LINTHICUM, Woodwardsville, Md.

Raspberry Plants $5 per 1,000. STRAWBERRY PLANTS, $3 per 1,000. Set plants this Fall; you may not have time next Spring.
A. B. KATKAMIER, Macedon, N. Y.

Woodview Nurseries
want to "clear up" several blocks of two and three-year trees that are on rented land, and they have some stock just under the extra size that they make interesting quotations on. Tell them what you want and get a bargain. BOX 100, URIAH, PA.

FINE NURSERY STOCK
Grown in the famous Delaware fruit land. Free from disease; true to name. **Fruit Trees, Berry Plants, Asparagus Roots.** Try our prices on **two-year Kieffer Pears.** DOVER NURSERIES
E. H. ATKINSON, Dover, Del.

GRAPE VINES
Currants, Gooseberries, Blackberries, Raspberries, Strawberries. Price List **FREE.**
Send 2c stamp for illustrated descriptive catalog.
T. S. HUBBARD CO. Fredonia, N. Y.

TREES, PLANTS and BULBS.
See our Bulb Offer in last week's paper. Send list of wants for estimate. Price-list free. Buy of Furnas and get what you order. Horticultural advice free.

STARK TREES SUCCEED WHERE OTHERS FAIL.
Largest Nursery. *Fruit Book Free.* Result of 76 years' experience.
STARK BROS., Louisiana, Mo.; Dansville, N.Y.

TREES Fruit and Ornamental Shrubs, Plants, Seeds.
Best by 48 years test. Try us. Direct deal will save you money. Catalog free. Satisfaction guaranteed.
STORRS & HARRISON CO., Painesville, Ohio.

CARMAN.
Earlier than Elberta; skin tough a good shipper. Consult our bnd-ded list of Peach Trees (over 1,200,000) 60 varieties; Asparagus, Strawberry Plants, Plum and Apple Trees. Send for catalogue.
HARRISON'S NURSERIES, Berlin, Md.

The October Purple Plum and Green Mountain Grape
are among the best fruits ever introduced. We are headquarters for both, and have a full assortment of other Nursery Stock. A fine stock of Shade Trees. Write for our catalogue before buying a tree of any kind. It's free.
STEPHEN HOYT'S SONS, New Canaan, Conn.

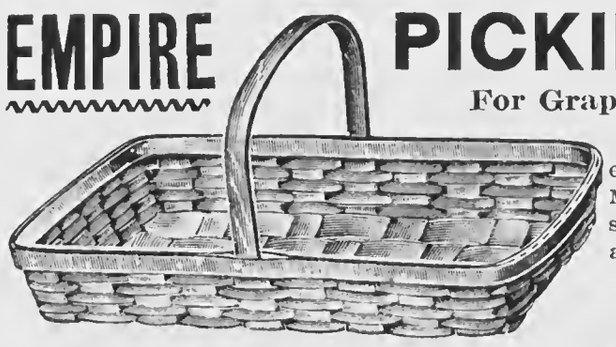
OUR FRUIT TREES
Ornamental Trees, Vines and Plants
are grown on the banks of the Hudson River, where with favorable climatic conditions, a perfect season, rich soil and thorough cultivation, we have matured the finest and most complete list of stock ever grown in the Hudson Valley. Quality always our first aim; personal inspection invited. Fall planting gives best results. Our Summer and Autumn Catalogue free to all readers of THE R. N.-Y. Ask us for information you may need on horticultural matters, and you will have answer in next mail.
T. J. DWYER & SON,
Orange Co. Nurseries. Box 1, Cornwall, N. Y.

FUMIGATED TREES ARE SAFE TREES
If you get the right kind. Rogers Trees are not only inspected and fumigated, but are bred from selected bearing parents, and you know what they will bear when you plant them. Can you afford to risk any others? Remember, if it's a **Rogers Tree** it's a **safe tree.** Drop a card for copies of **Tree Breeder.**
ROGERS ON THE HILL. THE ROGERS NURSERIES, Tree Breeders. Dansville, N. Y.

TREES $8 PER 100—APPLE, PEAR and PLUM, 3 to 5 feet high. HEALTHY and TRUE TO NAME. Best varieties. We sell all kinds of trees and plants at lowest **Wholesale** prices. **Don't** buy until you get our Catalogue, which is free, or send list of wants for **special** price. Address RELIANCE NURSERY, Box 10, Geneva, N. Y.

BULBS FOR FALL PLANTING Hyacinths, Tullps, Crocus, Narcissus, Lilies, etc. OUR NEW BULB CATALOGUE is sent free. It tells all about the best bulbs, also seasonable seeds and plants, including our celebrated grass mixtures for the lawn and pleasure ground. HENRY A. DREER, Philadelphia, Pa.

EMPIRE PICKING BASKET
For Grapes, Currants, Berries, etc.



STIFF HANDLE. SIZE 22x14x3½
Our Empire Picking Baskets are now used extensively by all large growers of Fruit Made very smooth and neat of selected ash splint with oak handle, very strong and durable and pronounced "just the thing."
COLES & COMPANY,
Manufacturers,
Nos. 109 & 111 Warren Street, New York.

Agreement of a Tree Agent.

Reader.—Will you print the agreement used on blanks issued by tree agents who do business for nurserymen?

ANS.—The following agreement is taken from the order blank of one of the most reliable nurseries in the country:

IN CONSIDERATION of the delivery of stock named below, I promise to pay to .....the sum of..... dollars in cash. Any stock omitted to be deducted from amount specified. All stock leaving the nursery guaranteed to be in a thrifty and healthy condition. All claims for allowances must be made within one week after delivery. Any agreement made between purchaser and agent must be written on the face of this order. This order not subject to countermand. If any of the varieties ordered should be exhausted in the nursery, you may supply others ripening at or near the same time, considered by you equally desirable.

$..... Signed.....

Various Fruit Questions.

C. W. F., Wayville, N. Y.—1. Will Rome Beauty and Sutton apples succeed well on rich sandy and gravelly loam, well underdrained and well air-drained. Good elevation in southeastern part of Saratoga County, N. Y. Would York Imperial be a profitable apple here? Baldwin and R. I. Greening succeed well here. 2. What is the average life of profitable bearing with first-class care for the Red June, Abundance, Arch Duke, Fellenburg and Monarch Japan plums? 3. In hybridizing, is the individual fruit which is produced from this process a hybrid, and will it show all the characteristics of the fruit which would be produced from its own seed, or do we get results only from the seed of crossed specimens? 4. What makes my Montmorency cherry trees, now four years old, crack lengthwise, excepting the very thin outside bark, which partially covers the opening?

ANS.—1. I think that both Sutton and Rome Beauty apples will succeed very well in the soil and locality described. York Imperial would be an experiment there, but I believe it is worthy of trial. As yet we do not know just how far north this variety will prove profitable, but I am inclined to believe that it will do reasonably well wherever the Baldwin and Rhode Island Greening flourish. 2. There has not been sufficient experience up to date with any of the Japan plums to enable us positively to know their age of profitable bearing, but indications point to their not being equal in this respect to the European or American varieties. They seem to begin to bear at a very early age, and are usually so productive that they exhaust themselves. I am inclined to the belief that 10 or 15 years is about their limit. Archduke, Fellenburg and Monarch are all of the European species. There are now profitable orchards of Fellenburg that have been profitable for as much as 20 years, and while the other two just mentioned are newer varieties it is probable that they will do as well. 3. This question brings up the old contested point of the immediate effects of pollenization upon fruits of various kinds. Many have contended that they have seen fruits changed in character by having been pollinated by other varieties, but, upon close questioning in almost every instance, this has either been disproved or made exceedingly doubtful. There have been several series of carefully-conducted experiments for the special purpose of thoroughly putting this to a test, and in every instance so far as I know they have failed to prove it correctly. For instance, as in the case of the flowers of the Bartlett pear having been pollenized by the pollen of the Seckel and numerous other varieties, the particular characteristics of the others have not appeared in or upon the fruit of the Bartlett, but the seeds have been materially affected, and the varieties thus produced have proved this to be true. The effect of pollenization is upon the seeds and not upon the frult, so far as the transmission of the peculiarities of the male parent are concerned. 4. There are a good many complaints from various parts of the country regarding the body of cherry trees being injured, and there is nothing strange in the experience with the Montmorency mentioned. It seems that the violent changes of temperature in the Winter time and probably the evaporation of sap, cause the cracking of the trunk, often killing the bark and tender wood beneath it, especially on the south side of the trunk. In California and other places where the climate is quite warm, cherry trees flourish splendidly and have very little of this trouble, but I have always believed this was due to the freedom from violent changes. The most trouble in this respect is in the region of the great plains of the Prairie States, where the ground, and often the trees as well, dry out to a very remarkable degree in Winter time. In New York there is no very serious trouble of this kind except occasionally. The preventive measure to be used is thorough cultivation, which will enable the tree usually to maintain its full vigor.

H. E. V. D.

A Grapevine Beetle.

F. T. B., Nunda, N. Y.—I send you specimens of bug found on grapevine in my garden. I found seven of them close together, but did not observe that they had done very much damage to foliage, but upon being confined they ate grape leaves ravenously.

ANS.—This grape pest is the large beetle known as the Spotted Pelidnota. While the beetles sometimes occur in considerable numbers on grapevines, they rarely do noticeable damage by eating the leaves. Usually the few that appear can be hand-picked and destroyed. The grub from which this beetle transforms, lives in rotten stumps or logs, eating only decaying or rotted matter. M. V. SLINGERLAND.

Seed-piece Left in Soil.

E. P., Hartford, Conn.—I dug two hills of late-planted potatoes from my garden and, although the vines were not dead, was much surprised to find the seed pieces (one-half of a fair-sized potato) perfectly sound. The yield was fair. It seems to me rather unusual, and if I have anything unique I don't want to cat them all up when some specialist might like to experiment with them.

ANS.—No, there is nothing very unusual about it. We have seen much the same thing, particularly where sulphur was used on the seed piece. The sulphur seems to prevent rotting. What is this "seed piece"? One or more "eyes" or buds and a portion of the tuber. The reason we use anything more than the "eye" is that we want to provide food for the bud or tiny plant until it can send shoots above ground and roots below to absorb food in its natural way—from the soil. The starch and other matters in the piece of potato feed the nursing plant, just as the food in a kernel of wheat or corn will feed the little germ until it can care for itself. In a good-sized piece of seed potato there is more food than the little plant requires, and in a favorable season the plant will leave most of the seed piece when it begins to feed direct from the soil. We have known these rejected seed pieces to dry up as hard as a piece of cork, or where sulphur is used, to remain in a natural condition.

EVERYBODY'S GARDEN.

BACK-YARD PRODUCTS.—These, of course, must vary according to circumstances. All locations will not favor fruit growing entirely, while again vegetables or flowers exclusively may be objectionable. A fruit tree or grapevine planted here or there will often utilize and beautify an otherwise unsightly or useless spot. The capacities of even a small back yard are never fully appreciated until thoroughly put to the test, and the results of intelligent management are often surprising. Careful planting of trees or vines, and thoughtful selection as to rotation of vegetables and flowers will develop prodigious capabilities in even a few square feet of space. The picture at Fig. 313, page 690, shows some of the possibilities of a back yard.

STORING WINTER VEGETABLES.—At this season of the year it is necessary to provide for the storage of such vegetables as are to be sold through the Winter, or held over until Spring. The later market prices are nearly always much higher than those obtained in the Fall; but to offset this, is the loss by natural shrinkage and decay, with added cost of extra handling. The contingencies of both methods of handling are pointed out, leaving each individual to adopt whichever plan seems best suited to personal surroundings.

POTATOES, whether stored in cellars or pitted should be thoroughly dried (but not greened by the sun) before storing permanently. If to be pitted, high ground should be selected and but little, if any, excavating should be done. Care must be taken to secure perfect drainage. Pile the tubers snugly and cover with perfectly dry, bright straw; do not use litter or rubbish of any sort, but just clean straw; and cover this with not less than six to eight inches of soil; firming sufficiently to turn any rainfall, however heavy, which may come. As colder weather approaches a second covering, the same as the first, may be made, only this time any kind of straw, or not too coarse litter may be used. Over this a covering of manure may be put on, and the crop will be secure from any degree of cold likely to occur.

CABBAGE.—The high prices for cabbage usually prevailing in the Spring are a strong temptation to carry over a portion of the crop, notwithstanding the usual losses. The principal safeguards against loss are dampness (not wet), and low temperature, with as little change as possible. A satisfactory practice is to put two rows together, inverting the heads and leaving the roots on. Cover with six to eight inches of soil, making the heap wedge shape; as cold weather comes on cover with straw or litter. The heap should be trenched at east side to make sure of good drainage. Parsnips and salsify for the Spring supply should be left standing in the rows. Cabbage, turnips and rutabagas should never be stored in the house cellar, as the odors are strong and offensive. All root crops for family use hold their freshness and flavor far better by putting in loose soil, allowing it to sift through as much as possible. Cover sufficiently to avoid freezing, with manure, litter or anything convenient, but let the loose soil come directly on to the vegetables. J. E. MORSE.

Michigan.

THE Wisconsin Horticulturist tells the following: "In Cooper's famous novel, 'The Spy,' a man is described as tying his horse to a locust. The book was translated into French, but the translator had never heard of a locust tree, and rendered the word 'sauterelle,' which means grasshopper. Feeling that this needed some explanation, he appended a foot-note, explaining that grasshoppers grew to a gigantic size in the United States, and that it was the custom to place a stuffed specimen at the door of every considerable mansion for the convenience of visitors, who hitched their horses to it."

The Cold commonly described as "deep-seated," with pain and soreness in the breast, difficulty of breathing, and all that, yields quickly to Dr. D. Jayne's Expectorant.—*Adv.*

NURSING MOTHERS

want Scott's emulsion of cod-liver oil, almost without exception. So before they get to be mothers, eating for two is no small tax, continued for months.

The emulsion not only is food itself; it gives strength for digesting usual food.

If the milk is scanty or poor, the emulsion increases supply and enriches quality.

We'll send you a little to try if you like.
SCOTT & BOWNE, 409 Pearl street, New York.

Cider Machinery.—Send for catalogue to Boomer & Boschert Press Co., 118 West Water St., Syracuse, N.Y.

GRAVES New Early Yellow FREE STONE PEACH
Price list free. W. J. GRAVES, Originator, Perry, O.

Onion Sets!—No more of them. Sow my hardy White Onion. Pound, $3; ounce, 25 cents; package, 10 cents. Send for testimonials. BEAULIEU, Woodhaven, N. Y.

SEED WHEAT—Fultz Mediterranean; very hardy. Heavy yielder, 40 bushels per acre, thrashers' measure. Clean seed, 90 cents per bushel. I. H. PERKINS, Dover, Del.

Sweet Corn—All who are fond of sweet corn, and would like to grow it in their garden next year, will do well to send to O. P. ORDWAY, Saxonville, Mass., for his circular in regard to the best variety.

Sow Jones Longberry No. 1.

A heavy crop can be grown from late sowing of this sort. Almost fly-proof. $2 per bushel. Send to Originator,

A. N. Jones, Newark, Wayne Co., N.Y.

The Chicago, Milwaukee and St. Paul Railway.

Many people unacquainted with the geography of the West imagine that because the names "Chicago, Milwaukee and St. Paul" are use in the corporate title of the railway owning the Short Line between Chicago and Omaha, they must go via the cities of Milwaukee St. Paul to reach their destination—and if it be Omaha or west thereof. This is a mistaken idea. On a map the line running directly east and west would looked liked this:

Omaha————————Chicago.

There is nothing more simple than that, and it is less than 500 miles between Chicago and Omaha. Two through trains daily in each direction with the best Sleeping Car and Dining Car Service, and all regular travelers know and appreciate the merits of the Chicago, Milwaukee & St. Paul Railway's Short Line between the East and the West.

Time tables, maps and information furnished on application to F. A. Miller, General Passenger Agent, Chicago—*Adv.*

The New Horticulture

BY H. M. STRINGFELLOW.

We do not hesitate to say that this is one of the most interesting books on horticulture that ever was printed. Most reading farmers have heard of the now famous "Stringfellow Method" of planting trees, but few understand clearly what it is. This book tells the whole story in clear-cut, forcible style, which all can understand. Not only is the theory of close root-pruning carefully explained, but the general principles of gardening and fruit-growing are discussed. Mr. Stringfellow is a practical gardener, and he gives his own experience. We commend the book to all without reserve. New Edition, paper covers, 50 cents.

THE RURAL NEW-YORKER, New York.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

THE AUSTIN OR MAYES DEWBERRY.—The following note is self explanatory. It would seem that Mr. Austin had the right to name this valuable berry if Mr. Mayes, who first brought the variety into cultivation, did not avail himself of his privilege. As a matter of fact, more novelties are named by disseminators than originators, though the latter have undoubtedly the first right to designate their productions. Unfortunately the name of Mayes has been adopted in most trade publications, and is given preference in Prof. Card's Bush Fruits, which may be regarded as about the highest authority on the subject. It will take much time to undo the mischief.

On page 614 you say: "We want more light on dewberry varieties." It seems that you and Mr. Holmes are both confused about the name of a dewberry you call the Mayes. You have been misled by some one, so I make the correction. Its name is "Austin's dewberry." It was brought to my notice first in 1889 on the Mayes farm here, near Pilot Point, Texas. Mr. Mayes gave me permission to name it, which I have done, and it is grown in many parts of the world as Austin's dewberry. Some other persons in Texas by might instead of right called it Mayes one year, but they know better now. The rules of nomenclature give the originator the first right to name a fruit and the introducer the next. Mr. Mayes did not want to name it, but gave his permission to me; and I being its original propagator and introducer, had a double right to name it. There has probably been more discussion over the name of this berry in Texas Farm and Ranch than any variety of fruit in any paper in America, besides thousands of circulars issued in defenee of the right of its introducer. The first year after being on my grounds 90 select berries filled a quart box, then 64 and later 53 berries; the same time it took 347 selected Early Harvest blackberries to fill it. When I began growing this berry in 1889 I had never seen an article on dewberry culture; our State horticultural societies or State Experiment Stations had paid no attention to them, but in 1894, when I sent a crate of them to Texas Farm and Ranch, they exclaimed that 53 filled a quart box packed in layers like peaches. J. W. AUSTIN.
Pilot Point, Texas.

WATERMELONS FOR HOME USE.—Excellent watermelons were formerly grown in Monmouth Co., N. J., in large quantity for the New York and New England markets, but since the irruption of the Georgia product they have generally ceased to be profitable. The idea that melons require newly-cleared ground is very prevalent, and the results of planting in soils badly infested with disease germs would often seem to bear out the claim, yet melons of high quality may be grown for home use on any well-prepared light garden soil if early-maturing varieties are selected, and the plants well fed from start to finish. Large shipping kinds of the Kolb's Gem type do not, as a rule, develop sufficiently to compare with the southern product, but early ones, such as Cole's Early, Fordhook First and Kleckly Sweet, ripen up perfectly during August, and far exceed the southern kinds in table quality, though the rinds are too brittle for shipment to distant markets. A well-ripened Kleckley Sweet is the most delicious of all watermelons in Rural Grounds estimation. Cole's Early is also very good. Fordhook First is the earliest to mature, and while not up to the others in sweetness, is generally better than melons bought in the market at the same time.

MORE ABOUT THE SULTAN PLUM.—The following note concerning Sultan plum, illustrated on page 658, is from J. H. Black, Son & Co., Hightstown, N. J.:

The plums of Sultan grew on grafts set two years ago. It is a strong grower, and has the beauty of the Satsuma and size of it also, and the good quality of the Delaware, than which there is no better. We like it very much. The only plum that did not rot with us outside of the Sultan was the Shiro, which had a tremendous crop, and carried them until they were overripe.

We can add further testimony to the good quality of the Delaware. It is a most excellent keeper, ripening gradually if picked while still firm, after full development. The solid, meaty, dark-red flesh is sweet and of better flavor, from our standpoint, than any of the Domestica varieties. The trees, however, are rather deliberate growers, and do not seem inclined to bear profusely at this early stage, having been set four years. Prof. John Craig, of Cornell Experiment Station, says, on page 678, that he does not like the quality of the Japan plums and their hybrids as well as the European varieties, but he does not mention Delaware or Sultan in comparison. The flesh of the hybrids between plums of the Botan type and native sorts is somewhat washy, but where Satsuma or Prunus Simonii enters into the combination the flavor is excellent, as far as we have been privileged to test them.

THE NEW GIANT MONTBRETIA GERMANIA.—This new large-flowered Montbretia was sent out last Spring by Henry A. Dreer Inc., Philadelphia, Pa., and our corms were received from that source. The plants grew nearly three feet high, and produced spikes of brilliant scarlet flowers, about three inches across. The base of the broad petals shades to bright orange, and the throat is blood red. We are told that this fine variety is the result of a cross between one of the new profuse-flowering hybrid Montbretias and the splendid Crocosmia aurea imperialis, which we have grown for many years. Imperialis has immense flowers for this species, usually more than four inches across, bright orange in color. It is somewhat erratic in growth, sometimes reaching four feet or more in height, but is rather difficult to carry over Winter, the tuber-like corms not keeping well. Germania, from its intense color and profuse blooming habit, will doubtless become a great favorite, and make a permanent addition to our short list of Summer-flowering bulbs. Several years ago numerous crosses were made between Crocosmia imperialis and various Montbretias on the Rural Grounds, and many brilliant, large-flowering varieties resulted, some of which we are still growing, but none have quite the intense orange scarlet of Germania, combined with a dwarf leafy growth. The colors are much varied, however, some of the markings being almost as diversified as among the Sparaxis. Montbretias and Crocosmias unfortunately are not always easy to Winter well, as the corms dry up if kept too warm in the cellar, and are seldom able to endure the frosts of Winter outside without the protection of a frame. We find the best method is to take up the clump just before the ground freezes and Winter them in the cellar in boxes of dry sand, without removing the tops. W. V. F.

MULCHING THE APPLE ORCHARD.

The exhibit of apples at the New York State Fair was a remarkable display, and the finest of all was the fruit shown by Grant M. Hitchings, of Onondaga Co. We have mentioned this fruit before. Mr. Hitchings says his orchard has not been plowed or cultivated for years. While the best authorities in the State have been urging farmers to plow and cultivate, Mr. Hitchings has gone exactly contrary to their advice. He lets the sod remain in the orchard and hauls in straw, manure or other vegetable matter, which is spread as a mulch all over the ground. He is even growing Alfalfa for this purpose. The Alfalfa is grown outside the orchard, cut and hauled in to spread under the trees. Little if any fertilizer has been used, but with this system of heavy mulching the trees keep strong and vigorous and bear regularly—while the fruit is very fine. Mr. Hitchings is a fruit farmer, and says he keeps only one cow and a work team. The experts go to see his orchard, and many of them admit that they cannot grow finer or more fruit even with the extra work of constant cultivation. Still, they do not feel like recommending this mulching plan for general adoption, for they say that there are probably special conditions of soil and location which make the plan best for Mr. Hitchings. They ought to make a careful study of these conditions and tell us just when and where the mulch will pay. On my own farm there is a hillside field where the rock comes close to the surface. I notice that in a dry time this thin layer of soil will bake hard even when the top is kept well cultivated. When there is a thick mulch of grass, weeds or leaves on the surface, I observe that this baking does not occur, but that the soil is always cooler and more open. In fact, on such a soil I am satisfied that a mulch of straw, grass or leaves will be far more useful than a "dust mulch" so-called—which means the upper soil well pulverized with harrow or cultivator. While Mr. Hitchings was explaining his plan of mulching, an old farmer stood near by listening carefully. At last he broke in about this way:

"I can take hemlock boards and lay them down on the ground close together so that the soil will all be shaded. Let them stay there a year or all through the Spring and Summer. Then work up the soil and plant any crop, and you will get as good a yield as you will on ordinary soil that has had a fair lot of manure. Some years ago the scientific men talked nothing but culture: culture!! Now, they are talking 'cover crops' stronger yet, which leads me to think that they now realize that they have overdone the culture advice, and burned up too much of the humus or cooling material in the soil." H. W. C.

Munson's Grapes in Louisiana.

I was much interested in that account of Prof. Munson's new grapes by G. L. Tinker, M. D. Twelve years ago I planted an acre to Concords mostly, some Wordens, Moore's Early and a few vines of several other varieties. Concord and Worden did fairly well, ripened unevenly some seasons; some varieties rotted at the start. Finally, the vineyard seemed to become so infested with both black and brown rot, and some vines died out, that I dug up the whole lot four years ago. Last year I planted a few vines of Prof. Munson's, the Carman, Presley, Brilliant, Delago, Wapanuka, Beacon, Fern Munson. Last Spring I added one vine each of Manito, R. W. Munson and Husmann. I don't expect all those varieties to do well down here, and I may have omitted one or more varieties that would, so should any readers of THE R. N.-Y. have tried any of Prof. Munson's new varieties of grapes in about this latitude (54 miles north of New Orleans) I should like an account of them. I had a few bunches of the following: Carman, Presley, Wapanuka, Delago, Beacon, Fern Munson, and the fruit was just as described in THE R. N.-Y., but the Fern Munson did not ripen evenly. The Carman is the most promising. R. J. M.
Hammond, La.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

Cyanide

Guaranteed 98 to 99 per cent., for generating

Hydrocyanic Acid Gas

the most effective fumigating material, to destroy scale insects on fruit trees and plants. The only positive eradicator of the dreaded **San Jose Scale.** Endorsed by all Agricultural Experiment Stations. "A perfect practical remedy," says Prof. W. G. Johnson, State Etymologist of Maryland.

GRINDS EAR CORN, SHELLED CORN, OATS, RYE, BARLEY, KAFFIR CORN, ETC.
Fine or coarse, for feed or family purposes. Has **shake feed. Burrs** are made of white metal, so hard that neither file nor tool will touch them. They will open and let nails or hard substances through without breakage. We furnish this mill with or without crushers and elevators.

CAPACITY 10 to 45 bu. an hr., according to power used, kind of grain and fineness you grind. The only mill that grinds ear corn and all other grain successfully. With 2, 4 or 6 H. P. Made in 3 sizes for power up to 12 horse. **Guaranteed** to grind more ear corn than any mill made with same power, because crusher and grinding plates are on separate shafts, reducing friction. We have 40 styles of grinders, adapted to power wind mills, engines and horse powers of all sizes. We also furnish powers of all kinds for driving all kinds of machinery. Write for our Large Free Catalogue of 15,000 other articles.
Marvin Smith Co., 55-59 N. Jefferson St., Chicago, Ills.

For Hard Wear

"Ball-Band" wool or rubber boots, shoes and Arctics wear well because they are made well. They outwear any other brand at any other price.
They are known and worn by lumbermen, farmers, stockmen and all outdoor workers all over the country. Their reputation has been made upon honesty in materials and methods of making. If you want to be sure your rubbers and woolen boots will stand hard service insist on getting

"Ball-Band" *Knit Boots, Socks, Rubber Boots, Shoes and Arctics*

Not made by the Trust. Refuse imitations. To distinguish the genuine look for the **Red Ball** in the trade mark found in a prominent part of boot or shoe. Sold everywhere. Ask your dealer for them.
MISHAWAKA WOOLEN MFG. CO., Mishawaka, Ind.

HOPE FARM NOTES

TAIL HOLDERS.—A few weeks since we had a question regarding a horse that gets his tail over the rein and holds it down. Here is a remedy that seems sensible:

A few weeks ago I noticed you mentioned the fact that "Old Major" annoys you by getting the lines under his tail and clinging to them, and that you know of no way to break a horse of this troublesome habit. I have known horses that took this method of getting a chance to run, and I have broken them of it by this simple arrangement: Wind the crupper to several times its usual size, with cloth or leather. This prevents a horse from being able to cling to the line if it gets under the tail, and after being driven in this way a few weeks, letting him get the line under frequently to convince him he can't hold it, you can take the wrappings off the crupper and he will have forgotten about his old habit. I hope Old Major is not too old to learn. B. E.
Warren Co., Pa.

Of course, with the crupper made so large the horse cannot get a clinch on the reins. Old Major is an expert at the business, and his tail is almost like a fifth leg. Too old to learn? Well, it depends upon the teacher and the method of instruction. You take a horse or a human that is old enough to be a grandfather, and not much of anything short of absolute prohibition well rubbed in will cause him to shed a bad habit!

RACING WITH FROST.—Our corn was very late, but as it was mostly at the top of the hill I took chances with the frost and did not begin to cut until September 23. On September 24 we woke to find a cold wind blowing down the valley, and all the old farmers shrugged their shoulders and said:

"That means frost surely!"

It did feel like it. I would not have cared so much for a still cold, for at such times the cold air rolls down our steep hills carrying frost to the valleys. When cold comes in this way we frequently have two weeks of growing weather after all tender plants have been killed in the valley two miles away. When frost comes with a wind, however, we lose this advantage, because the air is all stirred up together, and the colder waves or layers cannot drain away. That was why I feared for the corn, but after noon the wind died down, the air grew still, and the mercury went but little lower than 40 degrees all night. It was a closer call than we like, though the boys made the corn knives fly, for those stalks will have to be both bread and meat for the horses this Winter.

WHAT IS FROST?—Old Jack poked his nose so close to our faces that we heard his teeth snap. What is this thing that jumps upon us without warning, and ruins our tender crops in a single night? As a matter of curiosity I began to ask people to tell me what frost is. Most of them had never thought of it before, though all had suffered more or less from cold.

"Frozen dew!"

That was the best answer I could get. When dew collects on plants at a time when the temperature is below the freezing point we have frost.

Where does dew come from?

I find that people who have brushed through the dew for many years have but a vague idea as to what it is. Fill a pitcher with cool water and set it in warm air. We all know how a little film of moisture will form on the outside. I have heard people argue that this proves that the pitcher was porous, so that the water came through it. The truth is that the air around the pitcher contained water vapor. When this warm air came in contact with the colder pitcher this vapor is condensed into little drops of water which gather on the sides of the pitcher, until it becomes quite wet. This condensing of water occurs when a warm substance containing water vapor meets another substance cool enough to condense the vapor, and the dew comes from the warmer substance. During the nights, when dew is deposited, contrary to general belief, the soil is several degrees warmer than the air!

WHAT JACK DOES.—I had a field of fodder corn growing on the lower part of the farm. Had the mercury continued to fall I should have left the corn on the hill and cut the fodder, throwing it flat on the ground. The soil being warmer than the air would have prevented severe freezing, and the stalks would have thawed out slowly if they had frozen.

What good would that do? Are not frozen plants ruined?

As I understand it, the thawing is usually more destructive than the freezing. As we all know, the living plant is made up of little cells which contain water. Cold drives the water from these cells, and it may be frozen on the surface of the plant or among the cells, inside. When this frozen water thaws these little cells try to take it up again, and if they succeed in doing so the plant may actually live and go on growing slowly. When the thawing is very slow the water is presented no faster than the cells can use it. When the thaw is rapid the water returns too fast for the cells. They are overworked and die. I understand that gardeners sometimes save plants that are frosted, by dipping them in ice water, thus making them thaw out as slowly as possible. We would not think of dipping a frosted finger, nose or foot into *hot* water, but would rub it in snow or dip it in *cold* water.

HOUSE NOTES.—The stoves were not up by October 1, which is later than usual. We have had a wood fire in the open grate several times, but take it all around September was milder than last year. . . . We are now considering a bath room for the house. I hold that such a room is even more useful in the country than in the city. Since we have the water works we shall try to get the fixtures. I find that this season the room can be fitted up for about the price of 125 bushels of potatoes! The price of most things we must buy is pretty well fixed, while the price of what we sell jumps up and down like a school girl skipping rope. The great trouble we experience is finding a good place for drainage. The house is crowded close to the road on the lower part of the farm. We shall have to use a cess pool, since we cannot drain into the lower land across the road—for that belongs to a neighbor. Out by the barn is an old cistern which was used for stock water before we drilled the well. We may be able to dig this deeper and thus get fall enough from the house. If we use it we shall have to pump it out frequently either directly upon the soil or on to the manure pile.

PIG MATTERS.—We won first on Berkshire sows at the local fair. The little boar we sold in the Spring was also exhibited, and he won a first. I like the Berkshires more and more as I have a chance to observe them under all conditions. They suit our conditions exactly. . . . We have two little pigs that present a hard conundrum for the breeding expert. They are full sisters—their mother a grade Berkshire of fair breeding. They ran with the family and have had an equal chance in all respects. Yet, when one weighed 47 pounds the other weighed but 19! Now was the little thing a born "runt"—doomed from its birth to carry a stunted frame and a system incapable of assimilating food? It was not a question of breed or feed, but apparently some defect in the little fellow's vital makeup. We have put her by herself for an experiment in full feeding, but she will never pay. Out of three litters of 23 pigs there were four poor ones—this little dwarf being the worst of all. . . . The local butcher has offered me 10 cents a pound for two large hogs dressed. It just happens that right now pork is scarce, but within a week or two prices will tumble. I have noticed for several years that pork is short in our local market for a few weeks around October 1. Farmers do not like to kill until after a heavy frost. Within a short time now pork will be rushing in almost too fast to sell well.

FARM NOTES.—As I have explained, our chicken yard is in two parts. One part is used as a garden—the hens occupying it during Fall and Winter. We have just turned them in to clean out the weeds. The other side will now be plowed and sown to rye. . . . We are watching the growth of the Cow-horn turnips with much interest. Above ground they look much like the ordinary strap-leaf varieties, but below ground they make a long tap-root going down into the soil farther, with us, than the yellow turnips do. By the middle of September some of these tap-roots were nearly a foot long. We did not sow them in hard, tough soil, but in well-worked ground. It is claimed that they will dig down through the hard subsoil and not only open it up, but "pump" up fertility. I doubt whether these tap-roots do much more than bring water to the plant. Still, I should judge from the present appearance of the Cow-horns that they will help the soil if plowed under. . . . Our rape is quite satisfactory this year. We cut it and feed green to the hogs. Rape and corn fodder constitute seven per cent of the food of our breeding sows just now. . . . Poets and others tell of various perfumes to be found on the farm. One of the most satisfactory smells I know of is that which fills a cornfield a day or two after cutting. Those shocks as they slowly dry give out a solid and substantial perfume that is both sweet and sensible. That's the stuff for a farmer's handkerchief!

KNOWLEDGE IS KING.—Two weeks ago a friend punched me up a little because I gave advice. Here is the result of a little of that same advice given five years ago:

It may be of interest to you to know that the writer is a fruit grower now, most agreeably situated, with a splendid orchard two years old last March, as a result of advice given by you in June, 1896. He was then a bookkeeper to whom office work was very intolerable at Pine Bluff, Ark. I wrote to you for advice as to adopting agriculture. You replied: "Go to Cornell University for a year or two." I wrote to Prof. Roberts; he said: "Come." I landed there July 10, 1896, remained something over a year, and came to Georgia during 1898 to look up its advantages. I liked what I saw of the country and the prospect for peach culture, and so located here. Will say that I went to Cornell to study agriculture and registered for the agriculture course, but after attending Prof. Bailey's lectures in addition to regular course, horticulture seemed so much more attractive that I adopted it. My only regret is that I had not done so sooner. S. R. C.

I had forgotten the circumstance. A young man with fair capital and a desire to live in the country cannot do better than to spend a year or two at a good agricultural school. When I was a young man I went through an agricultural college, but in those days the college itself was trying to learn how to be really useful to farmers. I was part of an experiment which boys of to-day may profit by. At that time Prof. Bailey was a student—the best in the college—but few thought he was an educational bud destined to unfold into the representative of a new system of teaching. Why do I advise all young farmers to go to an agricultural college? I do not so advise—not by a good deal. Some are so situated that they cannot go. It might not do them any good if they did. I am frank to say that I nearly starved to death while I was trying to forget some of the things I learned, but other things have been of great benefit to me, and I would not give them up for twice the struggle they cost. At one time I felt like helping any young man who thought that he wanted to get an education. I am out of that business now, for I find that some folks do not know what they do want. To rush at an education as one would at a "fad" is bad business for all connected. When a boy wants a thing bad enough to get down and dig for it, and deny himself, he will usually get it and make good use of it, too. H. W. C.

To Users of Fertilizers

we recommend our books. Over a quarter of a million of these have been sent to American farmers—upon their request.

They are **free**, and we desire every farmer's library to contain them.

Send your name and address to

GERMAN KALI WORKS,
93 Nassau Street, New York.

LIME FERTILIZER.
Special preparation giving splendid satisfaction. Correspondence solicited THE SNOW FLAKE LIME CO., Bowling Green, Ohio.

BRAND NEW STEEL ROOFING

Bought at Receivers' Sale. Sheets either flat, corrugated or "V" crimped. No tools except a hatchet or hammer is needed to lay the roofing. We furnish free with each order enough paint to cover and nails to lay. Price per square, $1.75
A square means 100 square ft. Write for Free Catalogue No. 57 on General Merchandise. Chicago House Wrecking Co., West 35th and Iron Sts., Chicago, Ill.

SWAN'S Standard ROOFING
is not like others—it is better. It is Fire, Wind and Water-Proof, being a perfect roof in every way and at the same time has the advantage of being low in price. Fits the steepest or flattest roofs. Anybody can lay it. A knife and hammer are all the tools necessary. Saves you money on either new or old roofing. Sample and Circulars free.
THE A. F. SWAN CO., 114 Nassau St., NEW YORK.

RUBEROID
THE
POULTRY-HOUSE
ROOFING
As a water-proof covering for Poultry-Houses, RUBEROID has no equal. Keeps the houses cool during the warm weather, and warm in Winter, and the chicks dry and comfortable. The sun cannot melt it.
THE STANDARD PAINT CO.,
100 William Street,
NEW YORK.

How to Drain Land Profitably.
On every farm there is probably some land that could be made more productive by underdrainage. Properly drained land can always be worked earlier, and more profitably. The best and most economical way to drain is explained in the book, "Benefits of Dralnage and How to Drain," which is sent *free* by JOHN H. JACKSON,
76 Third Avenue, Albany, N. Y.
ROUND TILE

Dietz No. 3 Globe Street Lamp
Burns kerosene without a chimney. Extra large fount, holds oil for 24 hours burning. Has **self-extinguishing device,** automatically turning out light at hour desired. Yields abundant white light without smoking, is safe, cleanly and reliable in any wind. Will make a gas street lamp look dim.
If not sold by your dealer, write direct to the makers for special price delivered, and free catalog of lamps and lanterns.
R. E. DIETZ COMPANY, 87 Laight Street, New York City.
Established 1840.

JOHN J. DILLON, Business Manager.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, OCTOBER 12, 1901.

SEVERAL States have passed laws prohibiting fruit growers from spraying trees while in bloom. The object was to protect the bees, for if poison were put on the flowers the visiting bees are likely to be poisoned. We doubt whether these laws have ever proved of much benefit to bee keepers except in an indirect way. They have probably stimulated the investigators to demonstrate that spraying during bloom injures not only the bees, but the flower and fruit also.

*

WE want all the information we can get regarding the behavior of cow peas in the North.

When were they planted?

What varieties made seed?

How were they planted—alone or with some other crop?

What is a fair statement about them?

We want to know how these peas have prospered in the North. Give us bad reports as well as good ones—tell us the whole story.

THERE has been no intimation yet that any changes are to be made in the President's Cabinet. It would be strange if all the members remain, since it must be evident that Cabinet members are more or less personal advisers. In any event we sincerely hope that Secretary Wilson will remain at the head of the Agricultural Department. This Department is not old enough yet to make it a great compliment to say that Mr. Wilson is the best Secretary we have ever had. The truth is that he is doing a helpful work for the American farmer, and should be permitted to finish it.

*

The NATIONAL Farmers' Congress, in session at Sioux Falls, S. D., denounced the fraudulent trade in oleo, the Ship Subsidy bill and the scheme for National aid for irrigation. G. L. Flanders, of New York, was elected president. The oleo people made a strong effort to secure an endorsement for their product, but the dairy interests were too much for them. Some of the agricultural papers were disposed to sneer at the work of the dairymen in trying to control this Congress! It is no time to stay at home and sneer when our ex-Secretary of Agriculture goes to this Congress and fights hard for oleo. We favor going to every hole and corner where the subject is discussed with an argument for honest butter.

*

THERE are large deposits of gypsum or land plaster in Kansas, and efforts are being made to encourage its use as a fertilizer. Prof. E. Haworth, of the Kansas University, is reported as saying, among other things:

> It is used most extensively in old countries where fertilizers of all kinds are most in demand. It constitutes one of the main materials for enriching the soil to-day throughout Canada, New England and the central and southern Atlantic States, and its extensive application is gradually moving westward.

About 30 years ago that statement would have been more correct, but throughout these Eastern States plaster as used directly on the soil is a most decided back number. It is still used as an absorbent in stables or in manure piles, but seldom as a fertilizer. There are two good reasons for this. Formerly it was evident that certain crops were helped by an application of plaster. The reason for it was not very clear, but farmers judged by the effect. Reasons for the good results from plaster were given, which are now known to be absurd, the truth being that the plaster set free potash in the soil that otherwise might not have been available. After some years plaster lost its effect on crops, because it had set free all the potash it was able to work upon. With the knowledge of these facts came the general understanding that the first consideration of soil fertility is the presence of *available* nitrogen, phosphoric acid and potash. Experience showed that it was cheaper and surer to buy the potash outright rather than to try to make that in the soil more available by using plaster. Thus the use of plaster has been discontinued, and the direct fertilizing materials have taken its place. Plaster was really a kindergarten teacher in the school of fertilizers, and so it will be with its use in Kansas. The use of plaster will in time lead Kansas farmers to the direct application of potash and bone or dissolved rock.

*

MOST men realize how hard it is to state their exact meaning in a brief letter or printed article. There is no chance to discuss or explain, and the reader must think out for himself something of what lies between the lines. If reader and writer could come face to face and discuss the question there might be a much better understanding. Here lies the great value of a farmers' institute meeting above all other agricultural education, and this is really all that holds it together. Men meet face to face, and so have an opportunity thoroughly to understand each other if they will. One drawback to this is the fact that some farmers hesitate to get up before the audience and ask a question. During the intermissions they will come to the speaker and talk freely, so that some of the most helpful work of the institute is often done in these informal talks.

*

Now and then the Treasury Department at Washington, D. C., receives remittances in unsigned letters from people who in one way or another have defrauded the Government, usually through the short valuation of imports or the dodging of internal revenue taxes. These amounts are deposited in the Treasury in what is known as the "Conscience Fund." One of these letters recently received from New York contained $6,150 in large bills, and read as follows:

> After much thought I have been convinced that duties were not fully paid as desired, difference estimated at about two per cent. The wish now is to rectify what was done during some years ago, and amount is being sent which it is felt must be paid to the United States Treasury to discharge those duties and do the right. Above has been great grief.

This adds new emphasis to the fact that honesty is the best policy if one cares to keep on good terms with his conscience.

*

THE trekking outfit illustrated on the first page recalls the prairie schooners which carried American agriculture beyond the Mississippi and opened up an outlet for eastern energy in the Far West. The less settled portions of the country still see "movers," no longer pioneers, who find advantages in a similar mode of travel, but few now journey in that way here in the East, save for a leisurely vacation. The Trek to the South, of which a first installment appears on page 699, will, we are sure, be of peculiar interest. The travelers, a practical farmer and his wife, looked at the changing scenes through which they passed with intelligent interest, and their experiences are sure to be valuable and suggestive to others. Railroad speed has made us look with disfavor upon old-fashioned modes of travel, but the trek is not without its advantages, and, in the case under discussion, it was an abiding pleasure. For one who wishes to study the country, such a journey is a prolonged educational course.

*

HON. J. Sterling Morton, who was at one time Secretary of Agriculture, is opposed to the principle embodied in the Grout bill. In referring to what he calls "class" lawmaking, he is reported to have said:

> Persisted in this system of class lawmaking must logically spawn industrial strife and result at last in civil war. It sets up one citizen against another citizen. It arrays one industry against another industry. It formulates prejudice, selfishness, envy and malice into statutes.

The object of the Grout bill is to prevent the fraudulent sale of oleo as butter. Other methods have been tried and have largely failed, since the counterfeiting is skillfully done and there is a great profit in the business. It is now proposed to try the plan of taxing the colored oleo at the factory where it is made. Surely Mr. Morton would not have us stand still and see an honest business injured by fraudulent practices? The Grout bill does not "array one industry against another industry," but it seeks to compel 19 oleo manufacturers to be honest in their competition with 6,000,000 dairymen and 25,000,000 consumers of butter. When we stamp out a fraudulent business and compel counterfeits and substitutes to pass for just what they are, and no more, we do not "spawn" civil war—we prevent it!

THE success of associated dairying in both butter and cheese making warrants the trial of coöperative or centralized laundries and bakeries for the accommodation of farmers. Associated dairying, especially butter making, was opposed by many, especially by the farmers' wives, when it was first brought up, these people saying that nobody but a woman could make good butter; that the mixed milk from different farms would not make a satisfactory product, etc. These objections have all been conquered, and now associated or coöperative dairying is extensively practiced throughout the dairy districts of the United States. If farmers' wives would push the matter, coöperative bakeries and laundries could probably be established in the country, but the matter will largely rest with them. There seems no good reason why such laundries should not, in time, prove popular in many farm communities. One would think that the busy farmer's wife would be delighted to see her tub and washboard take a vacation. One can understand why she opposed the creamery system of butter making, for that took from her many a dollar of "pin-money" which was hers by both right and usage. The coöperative laundry will take nothing but dirt and hard work away from her, both of which she can easily dispense with.

THE following note comes from a girl in a New England country neighborhood:

> Seeing many helpful things in THE R. N.-Y., I now write to ask you whether you know of any work I could do at home. I am 20 years old, live on a farm, and I am staying at home to help Mother with the work.

There in a few lines we have a whole story of self-sacrifice and anchored ambition. This girl stays on the farm to help her mother. There are dozens of things which an ambitious young woman desires, and which can be procured only with cash. How can she earn money? The miserable "Work at Home" frauds take advantage of just such cases, and offer glowing promises of money-making. Several years ago we investigated many of these concerns. They were all "fakes"—their chief and only business being an effort to secure a "fee" or cash advance from people in need of a job. Our first advice would be to let these rascals who offer to set you up in a paying business entirely alone. What then can be done to earn cash in an ordinary country neighborhood? It ought not to be necessary to leave the country in order to obtain money with which to gratify a few simple and honest desires. This is a question of such wide and general importance that we will turn it over to our readers for discussion. How can a young country woman earn cash at home? Is there not some one among the great rural family who can help this girl? Please do not give us any theory—or what she ought to do. Tell us what you know *has been done!*

*

BREVITIES.

JONATHAN TO JOHN.

We used to have our battles on the sea
With ball and powder to decide the game;
You got some straight, hot shot, old boy, from me.
If 'twouldn't hurt your feelings I could name
A dozen cases where we pulled your flag—
The Chesapeake? And "Don't give up the ship?"
Of course, you know I'm not disposed to brag.
And now and then I made a little slip.
But what's the use of ball and powder now?
Our ships are iron teapots that can toss
A cannon ball aside—and, anyhow,
It's far more sport to have you come across
And try to "lift the cup"—we fight with wind
And find it hard, sometimes, to raise a breeze.
But, wind or powder—you are still behind
And once again your cherished hopes must freeze.

DON'T overfeed the sows.

A TWO-STORY man—the liar.

FROST has been kind to us this Fall.

BETTER be a toiler than a despoiler.

A $20 bill will not pay many of the old scores.

IT is claimed that crows will eat Tomato worms!

SOME new facts about fumigating trees next week.

IF you must throw bouquets at yourself—throw nettles.

THERE is little heard from the beet-sugar factories this year.

DON'T forget that the most important factor about truth is fact.

WE wish that some speakers would be as broad as they are long.

THE oft-repeated story of the big fish that "got away" becomes a grew some tale.

YES, sir, the cow makes milk with her heart and lungs—not with hide and horns. Look inside for performance.

THE creamery took a lot of pin money from the farmer's wife, added to it and made it spike money for the whole family.

Now it is thought that a fungous disease which means death to the Cotton worm has been discovered, and experiments will be made with spreading it in the field.

PROF. Slingerland states that in the Hudson River Valley many of the caterpillers of the Fall web-worm have died from the effects of some disease. We have observed the same thing on our own farm.

Events of the Week

DOMESTIC.—Emma Goldman, the anarchist lecturer, who was arrested in Chicago on suspicion of being concerned in the President's assassination, was released September 24, after two weeks' imprisonment, there being no evidence to hold her. . . . . The steamer Oregon arrived at Port Townsend, Wash., September 24, from Nome, with 474 passengers and $750,000 in gold. The steamer was long overdue, provisions were low, and the passengers had to be put on short rations. . . . . September 24, lightning struck a schoolhouse at St. Cloud, Minn., wrecking the building, and stunning the teacher and 36 pupils, three of whom were badly burned. . . . . Lieut. E. P. Bertholf, who was sent to Siberia last Winter by the Government to secure reindeer for the Alaskan stations, arrived at Port Clarence on August 28, with 254 of the animals. He secured the reindeer 1,000 miles north of Irkutsk, the present terminal of the Siberian Railway, and arrived with them at Orla after a journey hemmed in with inconceivable difficulties. . . . . Leon F. Czolgosz was sentenced at Buffalo, September 26, to be executed in Auburn prison during the week beginning October 28, 1901. The only statement made by the prisoner in court was a reiteration of his claim that he had no accomplices. . . . . The explosion of a gas tank at Newark, N. J., September 26, caused the death of six men. . . . . A cloudburst near the head waters of Alameda Creek in Presidio County, Texas, September 25, caused the death of 13 prospectors. . . . . President McKinley leaves an estate valued at about $225,000. It is left entirely to his widow, during her life, subject only to an annuity of $1,000 to be paid to Miss Helen McKinley, sister of the deceased. At Mrs. McKinley's death the entire estate is to be divided among the brothers and sisters of the testator. . . . . The city council of Grinnell, Iowa, has adopted an ordinance which makes it unlawful for two or more persons to congregate and buy one another drinks. It is held that "treating" promotes drunkenness. . . . . A fire and explosion in the Wellington colliery, British Columbia, October 1, caused the death of 17 miners. . . . . The teamsters' strike in San Francisco continues with violence. September 30, four special policemen fought with 200 strikers and sympathizers. Seven men were shot, one of whom will die. Regular police arrested 30 of the mob, all of them heavily armed.

ADMINISTRATION.—The appeal recently received from the District Attorney at Nome, Alaska, to have a Government vessel sent there to bring back to the United States indigent miners has been unfavorably acted upon by the War Department, to which it was referred by the Department of Justice. A similar request preferred one year ago was given favorable response, and an army transport was sent to bring back the "indigents." The anxiety manifested by the District Attorney at Nome is attributed to a desire on his part to get rid of a crowd of the more lawless characters rather than to aid people who are supposed to be in distress. At the War Department it was explained that there will be no necessity for persons having pecuniary means to remain in Northern Alaska during the Winter. There will be three or four merchant steamers touching at Nome before the close of navigation, so that those who desire to leave will have the opportunity to do so. . . . . Official estimates for the fiscal year beginning July 1, 1902, which Postmaster General Smith will submit to Congress at the opening of the session, call for an aggregate of $6,250,000 for rural free delivery service throughout the country, an increase of $2,750,000 over the current year. The total for the free delivery service proper, operated in cities, is $18,745,000, an increase of nine per cent. The grand aggregate for the entire postal free delivery service, including free delivery and rural free delivery, is $24,995,000.

CUBA.—General Leonard Wood, Governor of Cuba, September 27, promulgated an order of the War Department, making a reduction of 50 per cent in the duty on all machinery for making sugar and brandy, and for agricultural purposes, imported into Cuba during the past year. The same order repeals the special rebate of $3.40 per 100 kilos allowed on coffee coming into Cuba from Porto Rico. This provision was found necessary owing to the fact that Brazilian coffee was being shipped from New York to Porto Rico, and reshipped to Cuba for the purpose of avoiding the regular duty. A special provision allows the entry of railroad material at five per cent ad valorem for one year to come.

PHILIPPINES.—A company of the Ninth Infantry was attacked by Filipinos at Balangiga, Samar, September 28, and of the 72 men, only 24 escaped, 11 of these being wounded. The others were reported to have been killed. The rebels, who attacked the Americans while they were breakfasting, captured stores, ammunition and rifles. . . . . The municipal authorities of Manila have passed an ordinance doubling the size of the gates of the walled city in their part of the fortifications. The military authorities may object. . . . . Juan Cardona, who until recently was presidente of Geron, Province of Tarlac, and who was appointed secretary of the Tarlac provincial government, has been arrested on a charge of accusing people of crimes for the purpose of extorting money from them. More than 50 persons assert that they have been robbed by him, some declaring that they have even surrendered title deeds to property. Cardona had been considered one of the most reliable natives holding pro-American views. An examination of his record, however, shows that for several years he was a bandit, and that he served two terms of imprisonment, aggregating five years.

GENERAL FOREIGN NEWS.—Miss Stone, an American missionary in Turkey, is being held by Bulgarian bandits for a ransom of $125,000. The State Department advises buying her freedom and punishing the bandits when her safety is assured. . . . . Rio Janeiro has been officially declared infected with bubonic plague.

FARM AND GARDEN.—By recent changes in the Department of Agriculture, Prof. G. H. Powell, lately of Newark, Del., goes to the Pomology division as Assistant Pomologist, succeeding W. A. Taylor, who becomes Pomologist in Charge of Field Investigations. Prof. A. P. Close, of Utah, formerly at Geneva, N. Y., succeeds to Newark, Del.

Consul General Hurst reports from Vienna that the consumption of horse meat in the Austrian capital as an article of food is rapidly increasing. In 1899, 25,646 horses and 58 donkeys were slaughtered for food. This was over a thousand more than in the previous year, and about 3,000 more than in 1897.

The manager of the International Live Stock Exposition at Chicago, to be held the first week in December, announces that according to the regulations relative to the limit of time for making entries, it has been generally stated that no entries would be received after October 15. Now an important exception is noted. All entries will positively close October 15. Animals purchased at sales from that date up to and including November 7 will be admitted only by a supplemental entry which must be made immediately on purchase. The most pronounced interest is manifest in all parts of this country and many European live stock centers in the coming exhibition, and the finest of cattle, swine, sheep and horses ever shown in the United States or elsewhere is promised in the entries already made or assured.

H. H. Groff, of Simcoe, Ont., has been awarded a gold medal and 13 first prizes at the Pan-American Exposition for his exhibits of new hybrid Gladiolus.

The West Virginia State Horticultural Society, the State Sheep Breeders' and Wool Growers' Association, the State Poultry Association and the Virginia Live Stock Association met at Point Pleasant, W. Va., October 8-12; secretary, J. B. Garvin, Charleston.

A census bulletin issued September 30 shows that there is a total of 3,895 commercial floricultural establishments in the United States, with land and buildings valued at $33,000,000. Of the total Pennsylvania has 734 establishments valued at $6,837,808 and the value of the flowers and foliage plants raised in 1889 was $2,043,124. Of the States in which this industry was enumerated Pennsylvania was only eclipsed by New Jersey. That State had 494 establishments valued at $4,633,105, and an output in 1899 valued at $2,622,899.

A delegate convention of the Association of American Agricultural Colleges and Experiment Stations will be held at Washington, D. C., November 12.

The fifth annual meeting of the Continental Dorset Club was held at the Pan-American Exposition, Buffalo, September 24. There was a representative attendance. The secretary reported a year of unusual activity in his office; a large number of registries and transfers having been made, and a number of new members being received, among them Hon. John A. McGillivray, Canada's largest breeder, and a famous showman and importer. J. Fremont Hickman, who has served faithfully as president for four years, declined reëlection, and Jas. L. Henderson, of Washington, Pa., was made president. J. E. Wing was reëlected secretary and treasurer. John Hunter, Wyoming, Ontario, and W. G. Appleby, Bennington, Vt., were added to the executive committee. The following additional vice-presidents were chosen: Samuel Drumheller, Walla Walla, Wash.; S. B. Wright, Santa Rosa, Cal.; G. S. Lindkohl, Keswick, Va.; John A. McGillivray, Uxbridge, Ont., and Chas. G. McLain, Ringgold, Pa.

Dr. F. H. King, now Professor of Agricultural Physiology in the University of Wisconsin, has been appointed Chief of Division in the Bureau of Soils, Department of Agriculture. Dr. King is familiar to readers of THE R. N.-Y. through his discussion of various farm problems.

The legislative committee of the National Grange, Aaron Jones, E. B. Norris and N. J. Bachelder, have prepared a memorial to be presented to the Fifty-seventh Congress setting forth the demands and attitude of this great body on many questions of National import. The memorial sent out by Mr. Bachelder, of Concord, N. H., asks legislation as follows: 1. Further extension of rural free mail delivery. 2. Submit an amendment to the Constitution granting the power to Congress to regulate and control all corporations and combinations of capital of a monopolistic nature, thus preventing the use of their corporate power to restrain trade or arbitrarily fix prices. 3. Establishment of postal savings banks. 4. Pass a pure food law. 5. Completion of the Nicaragua Canal by the United States. 6. Grant additional powers to Interstate Commerce Commission. 7. Elect United States Senators by the people. 8. Opposition to the Ship Subsidy bill. 9. Prohibit fraudulent sale of colored oleomargarine.

Peaches in the Hudson Valley.

Last year there was a short crop, but this season the yield has astonished the natives, every old scrub of a peach tree growing wild among the weeds, as well as the well-kept orchards, being weighted down with loads of fruit. Notwithstanding the fact that everyone knows the necessity of thinning, not many paid any heed to this requirement, and the consequence was that quantities of small peaches were hawked about the streets of the local towns for 20 cents per basket. Despite the glut good peaches brought good prices. Not enough of first-class fruit could be furnished to supply the demand, the best selling freely for $1 to $1.25 a basket. The Triumph peach is coming to the front as an early variety, but its appearance is not prepossessing, and the fact that it is not entirely a freestone but rather a semi-free, is also against it. The tree is a good grower and prolific, and the quality of the fruit is very satisfactory for pie making, dumplings, peach cake and canning. It has been claimed that it is not subject to rot, but with us the rot started with this variety, and bushels of fruit and twigs were removed, but the deadly rot could not be controlled. We were obliged to ship rather prematurely, and doubtless thereby hurt the reputation of the peach in the section where the fruit found a market. Greensboro is a large, fine-looking early peach. The flesh is white. Though growing near the Triumph, it was not affected with rot. The foliage is luxurious and has a peculiar lustrous blue-green hue. This variety will carry to maturity and good marketable size without much thinning more peaches than any other sort we have seen, and through every gale it hangs on as well as the Elberta. The Elberta stands at the top as the best paying peach. Possessing many points of excellence it is not celebrated for its high quality. The shipping requirements have not allowed many of us to know it at its best, and we may have thus been led to judge it harshly, classing it with the big tasteless sorts that come to us from California. This year we let several fine specimen Elberta peaches get fully ripe upon the tree, and can now testify that when thus ripened, they are delicious. Score another point for this beautiful daughter of the sunny southland! Chairs Choice with us this year heads the list for beauty, uniform large size and highest quality, bringing the best prices, the dealers greedily calling for more even when plenty of other sorts were on hand. We shall plant more of it and have top-budded to this variety quite a lot of trees of less desirable sorts. Think it would be profitable also to set out some more Champions. They make a beautiful appearance when grown in the sunshine, the brilliant crimson contrasting admirably with the velvety white upon which it is overlaid. J. Y. P.

Hudson, N. Y.

General Crop Notes.

The clover in this part of the country is not so good as it was last year. We have about 60 per cent of a crop. What big clover we have is good, but the little clover is not so good. A. Y. S.

Cutler, Ind.

I believe that the amount of clover seed raised in the county will be an average crop. That raised on land that was pastured till June 1, or was clipped with the mower about that date, gave good yields of first-class seed. I have lived here since 1854, and never knew as large yield per acre (in some instances five or six bushels. The seed that was raised on land mowed for hay, will grade No. 2; yield light. Cause, excessive heat and drought. W. T. C.

Albion, Ind.

The drought still continues in this section of Christian County, though only a few miles distant there have been quite heavy showers. The roads are inches deep in dust, and traveling them is extremely unpleasant. Pastures have long been eaten up, and many farmers have been feeding their cattle for six weeks and more. Corn is down quite badly, and the yield will be cut still further thereby. Because of the high price of hay and the long feeding season ahead, everybody is preparing to cut up more corn than usual. In consequence there is a great demand for the twine-binding corn harvesters, which the factories are unable to fill. One local agent told me that he had sold seven, and and was obliged to refuse orders for twice as many more, as he could not get them. Owners of corn harvesters seem to have more than they can do cutting for their neighbors at 75 cents to $1 per acre, owners of corn furnishing twine. It seems to require from 1½ to three or four pounds per acre, at eight to nine cents per pound. I see and hear nothing of the sled cutters, used a few years ago. They would hardly work in the present corn crop anyway. Oats seem to be yielding better than was expected, running from 25 to 40 and 50 bushels per acre. Both oat and wheat straw are being baled more than common, and will undoubtedly be used much in place of hay. I also hear some talk of shredding and baling corn fodder, which some expect to sell at $7 or $8 per ton. On this place we are using a corn binder for the first time, and with the greatest satisfaction. It takes up the corn, which is badly down, and ties it up in good shape for shocking. It requires three common horses to go right along with it, and will cut eight or nine acres per day with one team. It has come to stay. Now we need a shredder that the individual farmer can afford to own. Corn is our great crop here, but I believe we do not get more than half the profit from it that we might.

Rosemond, Ill. G. W. B.

Southern Garden Truck

In a pamphlet just issued by the United States Department of Agriculture on the transportation of garden truck the following story is told:

In the Winter of 1847 No. 14 fire engine of New York had its headquarters on Church Street, between Fulton and Vesey. Fire engines in those days were manned by citizen firemen. If I mistake not the commission men were 14's main support. Next door to the engine house the boys rented a loafing parlor, and it goes without mention that toddies and the stiff mixtures were always in season. A clerk on one of the Charleston boats, which then landed at Pier 4, North River, front of Morris Street, was a guest, and while taking something, remarked the drink was nothing compared with the mint julep of the South, "such a one as I had a few days ago." The boys received the reference as a yarn, for where could mint be got in the middle of Winter, they having no personal experience of any other climate than that of New York? The clerk promised to prove his statement upon his next trip North. He left the boys, accompanied by a commission merchant, and in later conversation added that he would bring not only mint, but lettuce, radishes and strawberries as well. At this the merchant was doubly doubtful, and challenged the statement with a treat. Upon the return of the steamer the clerk proved the truth of his assertion. In a second-hand champagne basket he brought lettuce, radishes, mint, and, within an inner basket, were two quarts of strawberries. The strawberries, the first ever seen in New York in Winter time, were placed in a store window as a curiosity, where they were visited and examined by hundreds. This is said to be the beginning of the present vast trade in southern-grown produce.

Government Crop Report

The conditions of the past week have been favorable throughout most of the country east of the Mississippi, with but few damaging frosts. Stacked grain in the Dakotas has been damaged by heavy rains, while Illinois, Indiana and southern Michigan need rain to fit the soil for Fall plowing. The Pacific coast has been cool and wet, with severe frosts in Oregon and Washington. The corn crop is now nearly harvested, and out of the way of frost. Rain has hindered cotton picking in some sections of the belt, but in the central and western districts the work is progressing rapidly. Early-sown wheat in the lower Missouri Valley is coming up in excellent condition. Apple reports from Kansas and parts of Missouri, Arkansas, Illinois and West Virginia are encouraging, but no improvement over previous reports is noted in other sections.

Woman and Home

From Day to Day.

WHEN JOHNNY SPENDS THE DAY.

When Johnny spends the day with us, you never seen the beat
O' all the things a-happenin' in this ole house an' street.

Ma she begins by lockin' up the pantry door an' cellar,
An' ev'ry place that 's like as not to interest a feller.
An' all her chiny ornyments, a-stickin' 'round the wall,
She sets as high as she can reach, fer fear they'll git a fall.
An' then she gits the arnicky, an' stickin' plaster out,
An' says, "When Johnny 's visitin' they're good to have about."
I tell you what, there's plenty fuss
When Johnny spends the day with us!

When Johnny spends the day with us, Pa puts his books away,
An' says, "How long, in thunder, is that noosance goin' to stay?"
He brings the new lawn mower up, an' locks it in the shed;
An' hides his strop, an' razor, 'tween the covers on the bed.
He says, "Keep out that library, whatever else you do,
Er I shall have a settlement with you, an' Johnny, too!"
Says he, "It makes a lot o' fuss
To have him spend the day with us!"

When Johnny spends the day with us, the man acrost the street
Runs out an' swears like anything, an' stamps with both his feet;
An' says he'll have us 'rested 'cause his winder-glass is broke,
An' if he ever ketches us it won't be any joke!
He never knows who done it, 'cause there's no one ever 'round,
An' Johnny, in perticular, ain't likely to be found.
I tell you what, there's plenty fuss
When Johnny spends the day with us!

When Johnny spends the day with us, the cat gits up and goes
A-scootin' c'rost a dozen lots to some ole place she knows;
The next door children climb the fence, an' hang around for hours,
An' bust the hinges off the gate, an' trample down the flowers;
An' break the line with Bridget's wash, an' muddy up the cloze;
An' Bridget she gives warnin' then—an' that's the way it goes—
A plenty noise an' plenty fuss,
When Johnny spends the day with us!

—Elizabeth Sylvester in Century.

CHICAGO is to have a School of Domestic Arts and Science. This school will continue the work formerly conducted at Armour Institute, which was crowded out there by other departments. The school has been started by an organization of women, who recognize the good work which was done at Armour Institute. Cooking, sewing, dressmaking, millinery and nursing will all be taught practically, and the school is expected to be self-supporting.

*

A FRIEND in New York State asks how to make the old-fashioned watermelon rind preserve, which was a decided green in color, and cut into fanciful shapes. We have never made this sweetmeat, but recently met with the recipe for it. It improves and gains richness with keeping, and is exceedingly pretty. Cut up the rind in fanciful shapes. Place in strong brine and cover with grape leaves. After three days remove from the brine and soak in fresh water until all the salt taste is gone. Cover with cold water in which pulverized alum is dissolved, in the proportion of four tablespoonfuls to one gallon of water. Cover with grape leaves, and let simmer for about half an hour; again soak in fresh water to remove the taste of alum. Make a syrup of two quarts of water, two pounds of sugar, half a pound of ginger root, sliced very thin, and one ounce of mace; this will require half an hour's boiling or more to make a thick, rich syrup, and this proportion is for about 10 quarts of the rind. Pour the syrup over the rind, which must always be kept completely covered. From time to time add more syrup if necessary.

*

JUST what constitutes an educated man is generally regarded as a difficult definition. Our standards vary, nor is it safe to regard real education as intellectual training only. Here is a definition given in Munsey's Magazine by Prof. Butler, of Columbia College, as to the requirements which entitle a man to be termed educated:

1. Correctness and precision in the use of the mother tongue.
2. Those refined and gentle manners which are the expression of fixed habits of thought and of action.
3. The power and habit of reflection.
4. The power of intellectual growth.
5. Efficiency, the power to do.

*

HERE is a chicken story from Hindustan related by Mrs. Isabel Savory in her book, "A Sportswoman in India," which was related to her by a man whom she knew well in that country:

He had a henhouse and a hen that was sitting, but unluckily for her hatching operations a cobra got through a chink in the henhouse. The cobra made a fine meal of well-warmed eggs, but when it essayed to retire by the same hole through which it had entered it found those eggs in the way. It was much too large to get out, so it stuck in the hole, half in the henhouse and half outside. There it was discovered the next morning in a surfeited condition. It paid for its greediness with its life, and then it paid back the eggs it had stolen; for when the body of the snake was opened the eggs were all found unbroken and warm. They were replaced under the hen, and in due time were hatched, none the worse for their peculiar incubation. The strange fact that the cobra could swallow whole an egg much bigger than its own head is accounted for by the peculiar construction of that head. The head and jaws of the cobra are loose, and can be enormously stretched and distorted.

*

SOME time ago one of our readers in a western State told how she and her neighbors met on mending days, working together while one of their number read aloud. The gathering made toil a pleasure; work progressed rapidly, and the reading was a blessing to many a busy housewife who felt, ordinarily that she never had time to pick up a book or magazine. We hear of the same plan being carried out by other western women, who have formed a darning club, which gives them the opportunity of exchanging ideas, and listening to good literature, while they finish the week's mending. It is a good idea to plan such meetings now, before the Winter begins; a surprising amount of wholesome pleasure may be secured from it. There is one thing to be remembered, in planning such meetings; if any refreshments are served, they should be of the simplest character possible, like English afternoon tea. Elaboration destroys the character of such a gathering, and imposes an undue burden upon the hostess.

*

WE are told that the coming Winter is to see an extensive use of velvet, both in millinery and dress trimmings. Straps and rows of ribbon velvet are used a great deal on woolen waists. Where straps are used, the ends are pointed and often finished with tiny buttons. In some cases lacings of fine cord cross the straps, being fastened at each side with little bead-like ornaments. On the whole metal trimmings will not be used so much as last Winter, and the tinsel belts in such favor a year ago have now dropped quite out of sight. Some of them did rather suggest comparison with a brass band. In general trimmings, up-and-down lines and stripes hold favor; this effect is given by tucks and straps on the waists. Horizontal tucking seems out of favor, even on the sleeves. Although the coat sleeve is seen on outside wraps and plain cloth gowns, the tendency is still for decided fullness below the elbow, the bell sleeve or large pear-shaped puff appearing very frequently. The puffed undersleeve follows the outline of the bell shape, the puff being long, and decidedly full.

Pickling White Onions.

Can you give me a tested recipe for pickling small white onions? J. H. R.
Bridgeport, Conn.

First pour boiling water over the onions, to loosen the skins. As soon as cool enough to handle, begin to peel, dropping the onions, as peeled, into salt water (not brine) to prevent them from being discolored. Make a strong brine, heated to the boiling point, and pour over the onions. Leave them in the brine 48 hours, then drain. Spice vinegar according to the taste, which differs much with different persons, heat to boiling point, and pour over the onions. Set away for two or three days, then pour off the vinegar, heat it again, and cover the onions for the second time, put in the jars in which they are to be stored, tie up the covers and put away. To keep the onions white they should be pickled in white wine vinegar, but we prefer cider vinegar, because we are more sure of its purity, and it is more convenient. The onions take a yellow tint, but their flavor is unimpaired.

THERE are men who have never believed enough to doubt. There are some who have never thrown their hopes with such earnestness on the world to come as to feel anxiety for fear it should not be true. But every one who knows what faith is, knows too what is the desolation of doubt.—F. W. Robertson.

Business Methods in Farming

Farming that pays large dividends. How to get good workers and foremen. By S. W. Allerton. Reprinted from a recent number of THE SATURDAY EVENING POST and will be sent to any address, together with a three months' trial subscription to THE SATURDAY EVENING POST, on receipt of only twenty-five cents. THE SATURDAY EVENING POST is a handsome weekly magazine, beautifully printed and illustrated. Established by Benjamin Franklin in 1728, and published regularly every week for 173 years, and now has a circulation of 315,000 copies weekly, and ought to have a million.

No farmer can afford to lose what the strongest men in trade, politics and statecraft have to say—our own special contributors, including

A Trek to the South.

PART I.

"Fred thinks he would like to trek it in the Spring to North Carolina."

The words were spoken quietly and the odd Transvaal term held a ring of amused and sorrowful self-importance, as they fell from my sister's lips. To me, the little sentence sounded like the crack of doom.

I knew that the old homestead, bearing for many generations the family name, had through no fault of the husband and wife passed from them; that they were living on, but no longer owned it; that gradually the decision was crystallizing to seek and make a new one in a different atmosphere and milder climate. Still, the gentle finality in her words found me all unprepared for the severing of life-long ties and a closer and more dependent intercourse than is usually given near relatives so late in life.

"Fred thinks he would like to trek it in the Spring to North Carolina," might, to those unacquainted with the two, sound as if open to discussion. I knew too well their perfect unity of thought, to doubt for a moment that North Carolina was the point of destination, trekking the method of transit, and Spring the date of departure. Yet—

"Why trekking? Why North Carolina? Why Spring?"

In the leisure moments that fell on us through the busy days that followed these rebellious questions found patient and painstaking answer. They both felt the need of a long rest and change; never were away together during their 17 years of married life, and proposed to make this a kind of a silver wedding journey. Railroad travel always made them ill, and afforded no enjoyment. If they took their team, when arrived, they could drive about and decide on locating better and more independently. The expense would be no heavier than the railroad charges for themselves and team. As for North Carolina, Fred for many years had been much interested in the State; they "read it up" exhaustively, and believed that they would find, in one of its three belts, a congenial home and occupation. Spring was the season selected for starting to avoid the Fall rains, give two or three pleasant months for travel, and time at the end of the journey to rest and settle before cold weather. Lena finally summed up the situation in private.

"I really don't think, dear Hawk, that you need fear but what we will get along all right. There are so many things that Fred is good at. For instance, his general knowledge of farming, both as to raising crops and caring for stock; then his understanding as he does about fruit—the picking, packing, grafting, etc. Also he has his tinsmith's trade, and we are thrifty and careful."

As she talked there came to me a realization of their beautiful, unselfish lives and the promise to those who walk uprightly, and as time passed, I grew more than reconciled to their going. By the middle of April the best of their furniture and household wares were packed and stored, subject to orders, and the rest auctioned off with the remaining stock. The harnesses were then thoroughly repaired and a new first-class spring three-seated carriage purchased with waterproof curtains and a good brake. It was drawn to Clovernook's side door, the two back seats taken to the storehouse, and the packing began.

Under the carriage Fred swung the "emergency box," a rather long, shallow affair, containing ax, oil can, pincers,, wire, bolts, rope, etc. It is painted black, like the carriage, and is very clever and complete. Under the front seat were stowed the medicine chest, oil stove, box of cooking utensils and tool box. Two trunks occupied the back end, and bags of oats, meal, box and basket of provisions, the intervening space, with small hamper of bedding and light mattress on top. Valise with changes of linen, toilet articles, dusters, waterproofs, odds and ends handy; and at last all was in, tidily covered with a rubber blanket, and ready for departure; 1,500 pounds in all. Regarding the horses, they are of Canadian Messenger and Normandy stock. Owing to good care and handling they are very young horses for their years; Gray being 15 and Lady 20. They weigh about 1,000 pounds each. The last member of our trekking party to be mentioned is McKinley, a beautiful purebred black and tan collie, in the prime of life, and one of the best mannered and most intelligent of dogs; quite worthy of the honored name he bears. Because of our cold, rainy weather in May they remained till June 6, at about two o'clock in the afternoon, when the carriage pulled out of the yard, swung around into the road with its precious burden, and in the sweet clear air and sunshine—blue overhead and all the soft, tender grasses under foot—swiftly they rounded the curve and were gone.

The line of travel planned two points for stop-overs; Northfield, Delaware Co., N. Y., and Winchester, Va., the final destination being Pittsboro, N. C. Between these points at the start there was no very definite route mapped out, except to drive somewhat back in the Adirondacks (instead of following down the lake shore) owing to better roads and a more direct line, as the crow flies. Their plan was to camp out when weather and environment were satisfactory and at other times secure hotel or private board. If ever people felt the truth of Mr. Holmes's saying, "The world has a thousand roosts for man, but only one nest," they did before their journey's end. It was, especially at the start, a rather crowded "nest," and the "roosts"were many and varied; but they had each other, and that meant "home" to both.

For the first 16 miles they drove along the "State road," that in the old staging days connected Albany with Montreal. Over this same road in September, 1812, the "Britishers" marched through our little hamlet to join the naval force on Lake Champlain, at

3937 Woman's Jacket,
32 to 40 Bust.

Plattsburgh. And here, on Clovernook's hillside our forebears, intrenched behind breastworks, watched the long line of hated redcoats, with flashing bayonets and tossing flags, sweep like a resistless river into their country. And here, two days later, they stood boldly up and shouted derisively as the same long line of men, with "defeat" written on drooping heads and trailing flags, wended their way back over the border, eight miles distant, into Canada. But between those times and these methods of travel have changed, and it's many a day since the prairie schooner or trekking outfits have slipped their burdens along over the breast of the old road, and little is left of the wild forests with their occasional clearings. The Champlain Valley now holds comfortable homes and smiling, undulating fields of grain or meadow land; with, on the one side, the distant tips of the Adirondacks, and (as you travel south) on the left, the calm, beautiful lake, and beyond, sharp up against the sky, the Green Mountains of Vermont. Our trekkers must have felt heartened, as they wended their way through the lovely scene, and my sister writes:

"Lots of people stopped us and wish-

3934 Girl's Costume,
8 to 14 yrs

ed us 'good luck,' and I feel yet the strong, kind clasp of our dear minister's hand. Just after we had left the village we met a lot of gipsies. They were all dressed up and their wagons were draped with lace curtains. I told Fred we must go back and get ours. Fred drew down the corners of his mouth and said 'No!' A shower fell when about half way to Plattsburgh, and Fred put up the rubber boot and we were safe as at home. When it had passed, we got out and examined everytning and all was right and dry; so it will take a very hard rain to hurt us. Just before we reached Plattsburgh we caught that hard thunderstorm, but drove under a shed, had our supper and waited till it passed, so when we finally reached town the electric lights were swinging, and the cars spinning along, and everything glittering and wet.

"McKinley's thoughts were, 'My, I have had a good time!' The horses' were, 'My, but I'm all discouraged!' Fred's eyes were full of tears and I could guess his thoughts, too. Mine were, 'God be with us till we meet again,' so I sat up closer and slipped my hand in his. We put up at the hotel and next morning had a good time buying everything we wanted, till at last Fred said, 'I cannot get any more duds in the wagon; you must not buy another thing!'

"It is fun to see the different ways people take life. The thing that troubled our aunt about our trip was, 'How can you get your washing done?' I tried every way I could think of to cheer her up, but could not. At last I said, 'Aunt, we have lots of clothes; why Fred has six flannel shirts.' Well, that calmed her down. If he had all that, why he could keep clean for a while, anyway.

"The next morning we started off in the cold, and all day watched the mountains get nearer and nearer. I wanted to go through Poko-moonshine Gap, and Fred said we would. Au Sable is a lovely place, and we passed through the best part of it. The gardens are on the hillside, in the sand, and everything growing fine. The river there is also lovely, and we drove by its banks a long time. At last we reached Keeseville, and looking off from the top of a hill, what did we see but our Hotel Champlain and our dear old lake!" F. E. W.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

The Rural Patterns.

Short jackets are always in style, and the model shown has a novel look with its applied yoke. It would be appropriate either in a suit, or as a separate garment. The backs fit snugly to the figure, being cut with side backs and under-arm gores, but the fronts are loose fitting and include single darts only. The yoke is applied over the cloth, but can be omitted when preferred and the little coat left plain, as shown in the small cut. The neck is finished with a regulation coat collar and lapels, but the velvet facing is applied in a novel manner, the edge being cut in the vandyke points that appear in the newest designs. The sleeves are in bell shape and flare over the hands. To cut this jacket for a woman of medium size 2 7/2 yards of material 44 inches wide, or 2⅛ yards 50 inches wide will be required when yoke is used; two yards 44 inches or 1¾ yards 50 inches wide when jacket is made plain. The pattern No. 3937 is cut in sizes for a 32, 34, 36, 38 and 40-inch bust measure; price 10 cents.

The girl's costume shown, consisting of gored skirt and blouse, is made of Napoleon blue cheviot with strappings of the same, collar of blue velvet and chemisette of blue tucked taffeta. The blouse is cut with a plain back, drawn down snugly at the waist, and slightly loose fronts that droop over the belt. The neck is finished with a roll-over round collar, and the chemisette, or shield, renders it high at the neck. The sleeves are in bishop style with narrow pointed cuffs. The skirt is cut in five gores. The fullness at the back is laid in inverted pleats under which the placket can be finished, or the pleats can be stitched flat as illustrated, and the opening made invisibly at the left front seam. To cut this costume for a girl 10 years of age five yards of material 27 inches wide, 2⅞ yards 44 inches wide or 2⅜ yards 50 inches wide will be required. The pattern No. 3934 is cut in sizes for girls of 8, 10, 12 and 14 years of age; price 10 cents.

LIFE SIZE DOLL FREE "Baby's clothes will now fit Dollie."

Girls can get this beautiful Life Size Doll absolutely Free for selling only four boxes of our Great Cold & Headache Tablets at 25 cents a box. Write to-day and we will send you the tablets by mail postpaid; when sold send us the money ($1.00) and we will send you this Life Size Doll which is 2½ feet high and can wear baby's clothes. Dollie has an Indestructible Head, Golden Hair, Rosy Cheeks, Brown Eyes, Kid Colored Body, a Gold Plated Beauty Pin, Red Stockings, Black Shoes, and will stand alone. This doll is an exact reproduction of the finest hand painted French Doll, and will live in a child's memory long after childhood days have passed. Address,

BUSINESS BITS.

A NEW style of basket is offered this week by Coles & Co., 109-11 Warren Street, New York. This is specially designed for picking fruit, and will meet the wants of a great many fruit growers. This company makes baskets of every description.

FOR out-door lamps and lanterns the name "Dietz" is standard from one end of the country to the other. R. E. Dietz & Co., 87 Laight Street, New York, probably make more of these lamps than all others combined. If your dealer does not keep Dietz goods write direct for free catalogue and special prices delivered to you

OUR readers frequently ask us questions which are answered every week in our advertising columns. If anyone wants to know anything about horse carts we would ask him to read the advertisement of Hobson & Co., 19 State Street, New York. It's a small advertisement but a good cart, and any size you want.

THE nursery of Stephen Hoyt's Sons has been established for more than 50 years, and it is one of the good nursery houses that we never hesitate to recommend to our readers. The stock is at all times faultlessly cultivated, and great care is exercised that no disease shall get a foothold. The conditions at this nursery are perfect, and any reader needing trees of any kind will do well to write this firm. The address is New Canaan, Conn.

WE would direct the attention of our readers to the advertisement of the O. S. Kelly Manufacturing Company, of Iowa City, Ia., which appears elsewhere in this issue of our paper. Many of our readers will remember the Kelly people as the manufacturers of the Kelly duplex grinding mill, which has been so long and favorably known as a superior grinding mill. The mill is thoroughly good and reliable, and its use will help out wonderfully in this season of short feed. Write them for their latest catalogue.

SINCE reading of Mr. Lewis and his five-field system of potato growing I have adopted same, though I use sheep instead of cows, and plant potatoes about June 15, using second crop-seed. U. H. B.
Easton, Md.

A BUFFALO, N. Y., milkman, while in a saloon in that city, made a remark which was interpreted to mean that he thought it was a good thing for the country that President McKinley had been killed. What happened immediately after is thus told in the New York Sun: "Instantly the crowd went for the man. He was thrown to the floor, kicked, beaten, stamped and crushed. Chairs were hurled at him and he was in danger of being torn to pieces when some one picked him up and threw him through the door. He was able to crawl to his home. Several of the man's ribs were broken and it will be some time before he will recover. This does not include all his injuries, for his customers who heard of his alleged remarks discontinued buying milk from him."

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

CATARRH CAN BE CURED.

Catarrh is a kindred ailment of consumption long considered incurable; and yet there is one remedy that will positively cure catarrh in any of its stages. For many years this remedy was used by the late Dr. Stevens, a widely noted authority on all diseases of the throat and lungs. Having tested its wonderful curative powers in thousands of cases, and desiring to relieve human suffering, I will send free of charge to all sufferers from Catarrh, Asthma, Consumption & nervous diseases, this recipe, in German, French or English, with full directions for preparing and using. Sent by mail by addressing, with stamp, naming this paper W. A. Noyes, 847 Powers Block, Rochester, N. Y.

Oldest Commission House in New York. Established 1838. Butter cheese, eggs, pork, poultry, dressed calves, game, &c. E. B. WOODWARD, 302 Greenwich Street, New York.

Apples and Pears

This time of the year we make a specialty of handling shipments of apples and pears, and are now prepared to handle consignments to the best possible advantage. Write us at once for information regarding shipping, etc.; also for stencils.
ARCHDEACON & CO., 100 Murray St., New York

GLENN RANCH,

Glenn County, California,

FOR SALE IN SUBDIVISIONS.

This famous and well-known farm, the home of the late Dr. Glenn, "the wheat king," has been surveyed and subdivided. It is offered for sale in any sized government subdivision at remarkably low prices, and in no case, it is believed, exceeding what it is assessed for County and State taxation purposes.
This great ranch of 40,000 acres runs up and down the western bank of the Sacramento River for 15 miles. It is located in a region that has never lacked an ample rainfall, and no irrigation is required.
The river is navigable at all seasons of the year, and freight and trading boats make regular trips.
The closest personal inspection of the land by proposed purchasers is invited. Parties desiring to look at the land should go to Chico, California.
For further particulars and for maps, showing the subdivisions and prices per acre, address personally or by letter,
F. C. LUSK,
Agent of N. D. Rideout, Administrator of the Estate of H. J. Glenn, of Chico, Butte County, California.

PAN-AMERICAN, BUFFALO, N. Y.

Those expecting to attend the Fair can secure rooms in a private dwelling by addressing me. On a direct car line to Exposition, Niagara Falls and down town. Rates reasonable.

It is one of the best farm papers in the west and will tell you more about agriculture and live stock conditions in the great southwest than any other publication. It is filled with western stories and up-to-date articles in the breezy style of the west. **Missouri Valley Farmer, Topeka, Kansas.**

October At The Pan-American.

Less than thirty days remain before the gates of the Pan-American Exposition are closed forever.

During the crisp cool days of October Buffalo is at her best, and those who have delayed their visit until now will have the most delightful weather of the year in which to enjoy the wonders of the Rainbow City.

The same low rates are in force over the Lackawanna Railroad as during Midsummer. At this season a daylight ride over the Lackawanna System is a journey long to be remembered. Through the Delaware Water Gap and over the Blue Ridge ranges the woods are radiant in their autumnal coloring while the agricultural region of Western New York is mellowed by the wonderfully rich tones of the Fall harvest time.

Six solid vestibuled trains are run daily between New York and Buffalo; with daily through service between New York and Chicago and New York and St. Louis. Observation cars, dining cars and Pullman sleeping cars offer every comfort for the trip.

A beautiful guide, profusely illustrated telling about the Exposition and its features, will be sent on receipt of two cents in postage stamps. Write for one to T. W. Lee, General Passenger Agent, Lackawanna Railroad, New York.—*Adv*

BOOK BULLETIN

FOR SALE BY THE RURAL NEW-YORKER

How to Know the Wild Flowers, by Mrs. W. S. Dana; 346 pages; 110 illustrations; and 48 full-page colored plates. Can be used to advantage by those who have no knowledge of technical botanical names. A large number of wild flowers are described and illustrated so as to be identified easily. This book will add a decided pleasure to country life, in teaching one where to look for many of these beautiful but uncultivated flowers, which hide away and escape the notice of most people. Price $2.

Cut-price Books.—Any of these 20-cent pamphlets sent postpaid for 10 cents:

Fruit Packages.
Memory Training.
Country Roads.
Fertilizer Farming.
Chemicals and Clover.
My Handkerchief Garden.
Canning and Preserving.
How to Cook Cauliflower.
Milk Making and Marketing.
Tuberous Begonias.

THE RURAL NEW-YORKER,
409 Pearl St., New York.

MARKET NOTES

AN ARTISTIC FISH MAN.—His shop is near the Fulton Fish Market, and he has a show window usually well filled with fishy decorations. During the yacht races he added extra ornaments. Eel, cod, haddock, salmon and flounder patriotically carried little flags and yachting ensigns mounted on sticks. In the center of the window was a platter, the edge of which was fringed with alternate rows of shrimps and scallops, while lengthwise in letters made of minnows an inch long was the name of the yacht which he hoped would win.

COTTON NEWS.—The crop reports are not favorable, yet there is no prospect that the extreme prices of last year will be duplicated this season. At present speculators are doing but little, and European spinners appear to be taking only just enough for current needs. Many consumers have an idea that the planters will have to come to their terms anyway, yet conditions in the South are much more favorable than for a long time, and many growers who formerly had to sell at once are now able to hold their crop for some time if desired. The first killing frost is a feature that always stirs up the cotton market, and is usually expected in the cotton belt about the last of October. If it should come sooner, so as to cut any large quantity of the late crop, buyers would at once become active, and prices would advance at least temporarily.

CHANCE FOR COUNTRY BUYER.—A correspondent in Onondaga County, N. Y., says:

"I would like to act as buyer for a responsible concern in the city that desires a representative in the country to buy tobacco, apples, cabbages, potatoes, etc., by the carload, on commission; they to furnish the money. I could give bond for any amount intrusted to me."

Many city produce dealers could use such an agent to advantage, but he would not be able to make any definite arrangements in these lines until he had shown himself to be a competent buyer, that is, well acquainted with qualities and values of the stuff he is to handle, and with that peculiar sort of tact so necessary in dealing with those from whom he buys. This does not mean that he should always get the "best of the bargain" or ever resort to the sharp methods which make it unsafe for him to try to buy twice from the same man. If he expects to continue in business, he certainly must deal fairly. There is only now and then a man who has the natural qualities to make a permanent success of this business of going about the country and buying produce. Many of the people he will meet have most unreasonable ideas of the value of what they have to sell, and he must know how to stand his own ground and yet avoid giving offense. There are men of this stamp who have worked up an excellent business of this sort, and they are of decided service in a farming section.

FRUIT NOTES.—The season for peaches is drawing to a close, though the later varieties, such as Late Crawford and Morris White are now at their best. Many of the street fruit peddlers are selling California peaches. These are practically indestructible, and not likely to suffer from handling or to spoil on the vendor's hands. He dusts off their woolly rinds several times a day with a whisk broom, and arranges them on his cart fairest side up. They look fine, but are spongy and tasteless, and it is difficult to see how anyone would care to buy them the second time. Grapes are plentiful and selling well, though at somewhat reduced prices. Niagara and Delaware retail at 15 cents for four-pound baskets. Concord goes a little below this, although comparatively few Concords are sold in small baskets, while Salem brings 20 cents. Salem is a variety not well known. It is not grown to any great extent, as it mildews badly in some sections, and this scarcity is probably the chief reason for the high price. The berries are large reddish-brown; pulp separates readily from seeds; and flavor is decidedly peculiar. Plums are scarce. Most that I have noticed recently have been of prime quality and brought high prices. A large quantity of the apples coming in at present are of undesirable kinds, which sell at irregular prices. There are still plenty of the western-grown muskmelons, which sell for $1.50 to $2.25 per bushel crate. Receipts of cranberries have been in excess of the needs of the trade, and dealers are hoping for cooler weather, which always stimulates the demand for this fruit.

W. W. H.

PACIFIC SLOPE FRUIT GROWING.

In Southern California.

Orange culture is of greater importance in this part of southern California (Redlands, Highlands, Riverside) than any other horticultural industry. The trees yield abundantly, and the quality of the fruit is of the finest. There are few diseases. The most destructive insect, the White or Cottony cushion-scale, threatened a few years ago to become a serious if not a fatal enemy. This scale is now, however, under complete control of a parasite imported from Australia. Owing to the dry air, Summer heat, and absence of fogs, the other insects, such as Red, Black, Purple and Brown scales are easily kept under subjection. At certain intervals officers employed by the county go through the orchards and destroy, at the owner's expense, such scale as may be found. The tent and gas treatment is the method employed; appliances furnished by the county. Most of the orchards are held by small owners; five, 10, 15 and 20 acres each. A few growers have 100 acres or more. A number of orchards are owned by non-residents. In many cases the small orchardist does all his work of irrigating, cultivating, pruning, etc.; others are engaged in business in town and employ a man to do such work. Large orchardists have a superintendent or foreman, who employs the necessary help. Non-residents place their groves in the hands of men who make a business of such work. One man may have 30 to 60 acres under his care.

Redlands, Cal. B. R. S.

As Done in Oregon.

Very little grafting has been done on a large scale in this section. Generally some person in the community has the "knack" of making grafts grow, and gets the work of the neighborhood. Of spraying we are past masters. About 10 years ago some enterprising Californians made a thorough introduction of San José scale all through Oregon and Washington on nursery stock, and we have been vainly trying to exterminate it ever since. It can be kept in check, and almost exterminated, but not quite. Salt, sulphur and lime are most generally used as a spray, and a most vile compound it is. Two pounds of material to three or four gallons of water is the strength, and to the person using it the wonder is that any scale escape, for with that strength it is very corrosive, eating the hands wherever they are kept moist by handling the rods. I don't know of a single orchard where the scale has become well established that has successfully got rid of it. The State has very stringent laws against selling any fruit infested with scale, and as it is almost impossible to keep some very slightly infested fruit from being packed, and as the commission man will claim that the whole lot is condemned and a total loss, it makes the grower hesitate to ship from such orchards. This scale first came into notice in California, but has long since ceased to be the terror it once was, as some natural enemy has kept it in check there for a number of years, and this enemy is following it up in its new haunts. A grower in Jackson County, Oregon, writes me that the scale has entirely left his orchard of 160 acres, that was once badly infested.

Every man owning an orchard of any size has a spraying outfit of his own, and I don't know of a single instance of an outfit spraying orchards by contract, except in town, where an owner will have only a few trees. A good outfit for spraying consists of a 300-gallon tank on a low-down broad-tired wagon, and two leads of hose, 20 feet long, and a good strong pump made almost entirely of brass, all metal valves. Such an outfit will cost $125. One grower has a small gasoline engine to do his pumping, and four leads of hose, and sprays 1,200 trees a day. He claims the gasoline engine was the best investment he ever made, and as a result of eight sprayings for Codling moth his orchard turned out 98 per cent of apples free from worms, and he is now getting $1 per box f. o. b. for apples in the greatest apple year we ever had. He recently shipped 15 carloads in one day to England. Pruning is done very much as spraying, the owner superintending the work. Almost any person of average intelligence can do the work with a little practice. The expert traveling through the country is to be avoided, because he generally has a theory about pruning, and I never knew it to work in practice. One damaged me $1,000 or more in one season. S. D. E.

Cleveland, Ore.

THE MICHIGAN STATE FAIR.

Our first State fair was held in Detroit 52 years ago, in what is now Grand Circus Park, just a short distance north of the present business center of the city. This year's fair, the record-breaker of the entire series, was held in Pontiac September 23 to 27 inclusive. A veteran fair-goer remarked at Pontiac that the farm machinery on an ordinary farm nowadays, exceeded the entire exhibit in that line at the first State fair. The exhibits in every line were full to repletion, and doubtless exceeded those of any other fair in the history of the State. Space forbids any detailed account, but some exhibits, and notably that of western Canada, deserve special mention. This consisted chiefly of grain and forage grasses, very extensive as to proportions and beautifully arranged, showing up to fine advantage the wonderful resources of that country.

Our State experiment sub-station at Chatham, Upper Peninsula, although but two years of age, is an exceedingly lusty infant. Between 40 and 50 varieties of fruits, vegetables, grains and forage grasses, as fine as the earth produces, were exhibited from there, fully demonstrating that the Upper Peninsula has a great agricultural as well as mining future before it. Alpena County carried off the honors in county exhibits, and this was a matter of no little personal interest. In 1874 I made a business trip to Alpena, then a hole scooped out of the vast pine forests surrounding Thunder Bay, and reaching back westward "to be continued." Said hole in the pine woods consisted of sand, sawdust and about 3,000 inhabitants, without, so far as I could learn, a cleared farm in the entire county. There was lumber and lumber, and nothing else. During my visit there a load of turnips was hauled into town, which created as much excitement as a circus, and enquiring the cause of all this ado, I learned that that load of turnips was the first load of home-grown produce ever brought into Alpena. In 1901 the county came down to the annual tournament with her fruits, grains and vegetables and captured all first premiums on county exhibits in these classes. With an ideal climate, and soil producing such fruits, grains and vegetables, with good roads and home markets and plenty of land at from $2 to $5 per acre, it would seem that many of the tired city dwellers might find a haven of rest.

The thought indelibly impressed upon the mind of the careful observer at the Fair is that agriculture is the foundation upon which rests all other human industries, and that the farmer's brains are the motive power that keeps all other parts of the machinery in motion. Another thought also comes; that while these great State fairs are the educators of the comparative few, the local fairs are the training schools for the many. Boom the local fairs!

J. E. MORSE.

Germs of Typhoid Fever.

Typhoid fever, though such a widespread prevalent disease, would appear to be one of the most readily preventable of infectious diseases were the method of its propagation and the means for counteracting it generally understood and practiced. The germs that are the sole cause of the disease are taken in by the way of the mouth, sometimes perhaps with the food, but more commonly in the drinking water, or in milk that has been contaminated by infected water. These germs multiply enormously in the system, and are discharged mostly in the evacuations. From a consideration of this simple fact it will be evident that if the thorough disinfection of all the discharges of typhoid-fever patients was strictly attended to the disease might be very greatly limited, if not quite stamped out. Those unacquainted with the history of the disease are apt to think that the safest way to dispose of the discharges is to dig a hole in the garden, or somewhere outside, and bury them, while the truth is that it is really the worst way possible, with one exception, namely, putting them in the well, because these germs when so buried retain their vitality for a long time, and so may gradually by percolation through the soil get into the well. *All the discharges should be disinfected without delay.* As good a way as any is to use a solution containing 80 grains of corrosive sublimate, and four times that much of blue stone to the gallon of water. By adding a cupful, say, of this mixture to the discharges and allowing them to stand for a couple of hours before being emptied all danger from this source may be prevented. The length of time these germs, when not so treated, may retain their power to do mischief and the distance they may travel in the soil are well-nigh incredible.

W. O. H.

SUNNY WOMEN.

Who has not known the woman whose disposition is described by that one word "sunny?" There's always a laugh lurking on her lips. Her cheeks are ever ready to dimple in smiles. Her household influence is as brightening and stimulating as the sunshine. Nothing can be crueler than to have this sunshine blotted out by disease. But this is a common cruelty. The young wife who was the sunshine of the home becomes its shadow. Every young wife should know the value of Dr. Pierce's Favorite Prescription in the protection and preservation of the health. It promotes regularity, dries the drains which enfeeble body and mind, and cures inflammation, ulceration and female weakness. It nourishes the nervous system and gives to the body the balance and buoyancy of perfect health. It is a strictly temperance medicine.

"I can say that your medicine cured me," writes Mrs. Maud Pearce, of Stoutsville, Fairfield Co., Ohio. "I had suffered about twelve years from female weakness and I had almost given up, thinking there was no cure for me. Then I heard about Dr. Pierce's medicine and thought I would try it, and can say that seven bottles of your 'Favorite Prescription' made me well. I am now able to do my own housework. I took about twelve bottles in all of Dr. Pierce's medicines. Took some of the 'Golden Medical Discovery,' 'Favorite Prescription' and some of the 'Pleasant Pellets.'"

Dr. Pierce's Pellets cure constipation.

BEFORE BUYING A NEW HARNESS write for our 200 Page Illustrated Catalogue giving full description and prices of all kinds of single and double harness and save 25 per cent.

Live Stock and Dairy

WHEAT BRAN OR MIDDLINGS.
Do Cows Need So Much Protein?

PART III.

I desire to call especial attention to the quality of the milk yielded by the different cows and the amount of available protein charged to a pound of milk yielded. Betty gave milk containing 6.7 per cent fat, and is charged with .109 of available protein to a pound of milk yielded. What I mean by available protein is that which is left after deducting the amount supposed to be needed daily for maintenance of the body, assuming that the requirements for this purpose are at the rate of .7 of a pound per 1,000 pounds live weight. Dora gave milk that tested 6.1 per cent fat, and received .083 of available protein to each pound of milk yielded. But these two cows were not under normal conditions, because the former had aborted and the latter was nearing the close of her period of lactation, and for this reason were not in the experiment which followed this one. Beckley gave milk testing 5.6 per cent fat, and received .077 of a pound of available protein to a pound of milk yielded. During this experiment she received daily 1.63 pounds of protein, while during the experiment referred to in the first table she received 1.68 pounds of protein, and returned a pound of milk to .082 of protein, showing that she received more protein than she had use for. The heifer Tricksey gave milk containing 4.9 per cent butter fat, and when receiving a ration containing 1.70 pounds of protein returned a pound of milk to .071 of protein, and during the first experiment she received daily 1.56 of protein and returned a pound of milk to .061 of protein, clearly showing that at least during the first experiment she was receiving more protein than she needed for the work she was doing. This is also indicated by the record of Houston, that was giving milk containing exactly the same per cent of fat. Houston received 1.7 pounds of protein daily, and yielded a pound of milk testing 5.6 per cent fat and returned a pound of milk to .053 of a pound of protein. Sweet Briar that gave milk testing 4.8 per cent fat returned a pound of milk to .049 of available protein. Topsy's milk tested 3.7, and she gave a pound of milk to .041 of a pound of protein, and Countess, whose milk tested 2.4 per cent fat, returned a pound of milk to .034 of protein. While it is evident that some of the cows received more protein than they needed for the work they were doing, the table gives evidence worthy of serious consideration that cows require protein not only in proportion to the quantity of milk that they are yielding, but that the quality must be taken into account as well. With the fact that the herd maintained a wonderful uniformity in flow all Winter, that they never in the history of the herd did any better, it would be idle to contend that they did not receive enough protein to do their maximum amount of work. It is barely possible, however, that even during the Winter of 1895-6 they all received more protein than they needed.

The Wolff-Lehmann standard ration prescribes 1.6 pounds of protein daily for a cow yielding 11 pounds of milk daily; two pounds when yielding 16.6 pounds of milk; 2.5 when yielding 22 pounds of milk, and 3.3 when yielding 27.5 pounds of milk. The theory upon which the Wolff-Lehmann formula is based is that after deducting the .7 of a pound of protein needed daily for body maintenance she required .081 of protein to a pound of milk yielded. The record covering 154 days stall feeding, when all the feed was subjected to chemical analyses, and every ration was carefully weighed and tested twice a day separately, shows that the cows received only .047 of protein to a pound of milk yielded; that when the herd gave milk testing 3.9 per cent fat it returned a pound of milk to .046 of a pound of protein, and when it gave milk testing 4.07 per cent fat it returned a pound of milk to .048 of available protein. In the light of such evidence I may be pardoned if I hedge just a bit on what I may have said when I took the generally-accepted feeding standard as my text. When a daily protein supply of 2.5 pounds suffices for cows yielding 500 or more pounds of butter per year, and when cows receiving 1.7 pounds of protein average 301 pounds of butter per year, the query arises what shall we prescribe for farmers' cows that average 132 pounds of butter per year, as is the case with the 335,000 cows that are contributing milk to Minnesota creameries? T. L. HAECKER.

TAMING AND TRAINING A HORSE.

The following note was received from a good friend at the time our frisky mare, Nellie Bly, was given to shying and dancing at sight of bicycles. She has now reformed—yet the advice is, as we believe, very sound.

I wish to say to the Hope Farm man that in my opinion it is not enough for a woman to be able to harness and unharness a horse to make her a safe driver, if she is to drive a spirited animal, and I believe that the well-bred, intelligent kind horse is much the safest for women to drive, even if he is a lively one. If he has been properly trained he will be perfectly safe when he has once become acquainted with his driver. You say that Nellie Bly is a little too frisky for the Madame to drive. Now, if the Madame loves a horse and has a desire to drive Nellie Bly, I will tell you how she can do it safely. Turn the mare loose in a large box stall or other convenient place, let the Madame take with her a good whip and also some oats or other grain in her pocket. Go alone into the stall; be calm; do nothing in a hurry. Speak kindly but with firmness. Command Nellie to come to you; if she obeys pat her and give some oats. If she turns from you use the whip quickly, and again give the command to come. If she does it feed her a little, but never give any feed until she does as you want her to. By kind and firm treatment teach her that when she obeys you are her best friend. She will soon come at your command; then ask her to follow you about the stall. Be careful to have her understand what you want before you punish her for not doing it. Teach her just one thing at a time, and never leave it until she does it well; then take up another lesson. One lesson in a day is enough; don't be in a hurry. Work with her until she is under your control, and will obey you promptly. Teach her to obey the word "Whoa" whenever she hears it, and to stand until told to go. Do this in the barn. Now, when you have taught her to obey and also that you are the best friend she has in the world, you may harness and drive her with safety.

One word about driving. When ready to start get into the wagon, fix the robes, etc., but do not pick up the lines until ready to start, then give her the word. Always in stopping use the word and not the lines. When driving, if she is inclined to go faster than you wish, use the word steady, or some other, but always the same one; she will soon learn to slacken her pace at the word. Use the lines simply to guide her when necessary. Teach her to drive with slack or tight line as you wish. Never use the whip when in the harness, except as a gentle reminder of her duty. After you have taught her to drive as I have indicated money wouldn't buy Nellie Bly. D. R. P.

New York.

FEEDING BRAN WITH SILAGE.

What per cent of protein in silage; also in what proportion should wheat bran be fed with it? G. E. W.

Pennsylvania.

Prof. Henry in his work "Feeds and Feeding," gives the following analysis of corn silage, the average of 99 samples: Water, 79.1; ash, 1.4; protein, 1.7; crude fiber, 6.0; carbohydrates, 11.0; fat, 0.8. This does not materially vary from other tables which are considered standard. An animal would therefore need 150 pounds a day to get enough protein for a full flow of milk, or 2½ pounds of protein, which is not far from the profitable amount, provided the cost is not excessive. The ration maker so often overlooks the cost of the food, when perhaps, to make the ideal ration, the extra cost would more than balance the extra gain. For instance, in our own locality many farmers have such an abundance of corn that they are feeding excessively of it, and the cows are doing well, but it is not an ideal ration. The wheat bran to balance it is worth $19 per ton, and I am satisfied from experience under such conditions that $19 would not produce $19 worth of milk above present production. I am not making a plea for less food, nor necessarily for less grain food, but clover aftermath and corn are not with us marketable crops; especially is this true when it rains nearly every day. We are turning an unmarketable crop into milk, which has a ready cash value, saving the purchase of expensive grain foods If bran is to be fed, we will assume that the cow will eat 50 pounds a day of silage. At this season of the year, or until October 20, she will get a small amount of grass each day, which will not affect the ration, because it is nearly balanced. The corn silage will contain .85 pounds protein, and to assume that the grass eaten will make it one pound, we shall have to supply a pound to 1½ pound of protein with the bran, which will call for seven to 10 pounds, an expense of seven to 10 cents a day. Other protein foods may be substituted for a portion of the ration, when economy in cost warrants it. In other words, digestible protein wherever found, if palatable, will have about an equal value for milk production. H. E. C.

Horse Owners Should Use
GOMBAULT'S
Caustic Balsam
The Great French Veterinary Remedy.
A SAFE, SPEEDY AND POSITIVE CURE.

Prepared exclusively by J. E. Gombault ex-Veterinary Surgeon to the French Government Stud

SUPERSEDES ALL CAUTERY OR FIRING
Impossible to produce any scar or blemish. The safest best Blister ever used. Takes the place of all liniments for mild or severe action. Removes all Bunches or Blemishes from Horses or Cattle.
As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, Etc., it is invaluable.
WE GUARANTEE that one tablespoonful of CAUSTIC BALSAM will produce more actual results than a whole bottle of any liniment or spavin cure mixture ever made.
Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address
THE LAWRENCE-WILLIAMS CO., Cleveland, Ohio

Newton's Heave, Cough, Distemper and Indigestion Cure. A veterinary specific for wind, throat and stomach troubles. Strong recommends. $1 per can. Dealers, mail or Ex. paid. Newton Horse Remedy Co. (Y) Toledo, Ohio.

Dana's White Metallic EAR LABELS
Stamped with any name or address with consecutive numbers. I supply forty recording associations and thousands of practical farmers, breeders and veterinarians. Sample free. Agents Wanted.
C. H. DANA, 74 Main St., West Lebanon, N. H.

When you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

Cure Barren Animals
THE LOSS SAVED IS CLEAR PROFIT.
Others Cure their Animals, WHY BUTCHER yours? Thousands of cows, mares, sows, etc., restored to breeding in the past 20 years. The best stock farms in the world are our patrons, why not you? ABORTION: Every cow that aborts should be treated with this remedy. You cannot afford to experiment, profit by the experience of expert breeders. Treatment by mail, $1.10. Other remedies just as reliable Ask for circulars any way.
MOORE BROS., Veterinary Surgeons, Albany, N.Y

THE WINTER CALF.

I have seen many a Winter calf which at once excited my sympathy. Tied by a short rope to a post on the barn floor, or more commonly in one corner of it, under foot a mass of nasty straw, there it stands, shivering in the breeze which comes through the cracks in the siding; back humped up, tail hugged down, utter wretchedness depicted in every feature. Twice daily it is given a mess of milk which is usually either too hot or too cold, and in quantity either too much or not enough. Surely that calf will be glad to see Spring come—for it rarely dies after all. What a delight to be free, to kick up its heels in the warm air, and to nip the tender blades of grass; that is, what few there are between the burdocks and Mayweeds with which the average calf pasture is thickly strewn.

The Winter calf needs a box stall, or a place where he may be allowed his liberty, and room to turn around and kick up his heels and play. It should be warm and dry. Building paper will make a stable warm very cheaply. Straw is plentiful this year, so let that calf pen be well littered, and cleaned out frequently. Did you ever notice how the little things play and kick up when you put in fresh bedding for them? They enjoy it, and tell you as plainly as they can how thankful they are for it. A pig will do the same thing. Just carry in a forkful of nice, clean straw, and see what a lot of monkey shines they will cut up!

The young calf needs to be fed carefully, or it will not be thrifty. Overfeeding with milk will ruin it as quickly as underfeeding. The milk should be always of the proper temperature, not so hot as to burn the mouth when the eager little fellow dips his nose into it. In quantity no rule can be laid down, but it is better to err on the side of too little than too much during the first few weeks. A successful feeder has said that he keeps watch of the calf's sides as it drinks, and when they are just flush with the hip the milk is withheld. Overfeeding causes indigestion, and this more easily with some calves than with others. The dainty little Jersey cannot stand the ration which would be none too much for the sturdy Durham. If the bowels become loose it is an indication of too liberal a milk ration. Cut this down and give three raw eggs twice a day. These are strengthening and healing to the inflamed bowels, and are cheaper than drugs, besides being always at hand. We have cured scours in calves with eggs when disease had resisted every other known remedy. Just break the shell, hold up the calf's head and down it goes. They soon learn to like it.

When the calf is two weeks old it will begin to eat hay, and a little should be placed within reach. Turn it over every day, so the fresh spears will be outside, or give it to an older animal and put fresh in its place. After a few weeks finely-cut corn fodder will be eaten to quite an extent. Our calves had no hay last Winter. They seem to like the cut feed, and it is far cheaper and more plentiful than hay. In feeding calves we find a little grain beneficial. Bran comes into use here, as the best we can give. Formerly it was fed in the milk, but now we feed it dry, and prefer the latter method. The milk is fed first in the morning; then we go around with a bushel basket of the cut fodder, and give them their ration of this for the day. The pails from which the milk is drank are cleaned out by this time, and a handful of bran and ground oats is dropped into each. They get no grain at night. This ration varies with the age of the calf, but it is measured out only by the hand. We aim to get big paunches on our heifer calves, and encourage them to eat all the roughage possible.

Under the conditions named, warm, dry quarters, sunshine when possible, just enough milk at the right temperature, hay or cut corn fodder to pick at, and a little bran or ground oats, you may have a better calf out of the one dropped in Fall or Winter than the one dropped in Spring or Summer. In raising calves the same as with any young stock, the point is to furnish enough suitable food to keep them growing thriftily. In addition to this they must be kept warm and dry. Damp, foul stables are a menace to the health of any animal, but most of all to those which are young. W. C. R.

Michigan.

Acorns as Food for Pigs.

A man in Connecticut wishes to know about feeding acorns to pigs. He has been told that too many acorns will injure his hogs, and that this food will make pork soft and oily. At Tuskegee Institute, Alabama, a large number of pigs were fed on acorns, and with success. In reporting on this feeding in the first bulletin from the Institute, Prof. Carver says that it is desirable to give some laxative along with the acorns, as they have a very constipating effect, and so injure the pigs where fed in large quantity. Roots or any green feed will act as a laxative. They also found that acorns produced a soft, spongy flesh, with an oily-like lard, that hardened with great difficulty, and frequently not at all. This, however, was readily overcome by feeding corn for two or three weeks before butchering, which resulted in the hardening of the flesh. Many people in the South, it is said, sell pigs that have been largely fed on acorns, and that are not finished off on corn. The policy, however, is not a good one. C. S. PLUMB.

Breeding Hornless Cattle.

Prof. C. S. Plumb some time ago criticised my statement in regard to crossing cattle with a little Polled Angus blood, and said that he could see no possible benefit to come from such breeding. I would like to ask him whether he thinks there is no advantage in having the horns bred off? I failed to specify this in particular, and also that I added possibly hardihood. These benefits *only* I claim. J. L. B.

Falls, W. Va.

I do consider it an advantage to have hornless cattle. This has been so fully demonstrated in western feed lots that now large numbers of cattle come into Chicago market from which the horns have been removed at some time, or from which they have been bred off in this or some other generation. Such hornless cattle inflict much less injury on their mates than do horned ones, and a larger number may be fed together, than of horned stock. It is not necessary to use a hornless male to secure hornless cattle, because the horns on young calves can be easily destroyed by applying a little caustic potash to them when in the immature stage. To be sure a mulley bull will accomplish the result just as well and with less trouble. In this respect the use of an Angus bull might be justifiable.

My original discussion in THE R. N.-Y. was on the crossing of Short-horns and Aberdeen Angus, using the latter for the sire. These two breeds represent our very best beef types. The average Angus is perhaps more hardy than the average Short-horn, but it will not be difficult to secure plenty of Short-horns equally hardy with the Angus. I still adhere to my original proposition, that it is not desirable to cross these breeds as breeds. If one wish the mulley type, and of a hardy class, then select the straight Angus, or a mulley Short-horn. And if one is to keep only grade Short-horns, then I should advise the use of a hornless, purebred Short-horn bull, with a rib, skin and heart-girth that would guarantee a hardy constitution. Such a bull would produce no violent cross, should improve the type, and give more uniform offspring than the direct cross. C. S. PLUMB.

Bumble Foot on Fowls.

What is the disease that has got into my flock of chickens? The foot swells badly on the bottom. In the center of this swelling is a round hard scab. When I take this off and probe the sore a great amount of thick blood comes out. The same thing comes on the joints, but I cut these right off and they got well. Is it a bad case of scaly legs? What can I do to cure it? J. M'L.

Romeo, Mich.

The trouble with these chickens is surely bumble foot, although it seldom affects but a few in a flock, and I think comes from bruised feet. The only cure is to open and wash out with some antiseptic. J. E. S.

The fattest cattle at the Pan-American are the Polled Durhams owned by J. H. Miller, of Peru, Ind. Several of these weigh a ton each and they are as fat as butter.

The largest bull at the Pan-American is a Short-horn that weighs 2,750 pounds. The smallest full-grown animal is a French-Canadian cow and she weighs less than 400. Between these extremes are all sizes, but only one quality, and that is the best and most valuable that the continent affords.

Cream Separators.

De Laval "Alpha" and "Baby" Separators.

First—Best—Cheapest. All Styles—Sizes.

Prices, $50 to $800.

VT. FARM MACHINE CO., BELLOWS FALLS, VT

The EMPIRE Cream Separator

It's Built Like This.

Under the latest and most valuable cream separator patents in existence.

Of the best material possible to procure on any market.

By workmen specially skilled in their particular line.

So that it will give the best possible service, regardless of cost to manufacture.

It Is Sold Like This.

OUR GUARANTEE.

Such confidence have we in the Empire Cream Separator, both as to its skimming qualities and the durability of its mechanical parts, that we guarantee every EMPIRE machine, when set up, operated and cared for in accordance with the directions sent with the machine, to skim at rated capacity and produce as fine quality of cream and as great quantity of butter from a given amount of milk as any other cream separator or creaming system in existence. We further guarantee that all mechanical parts are perfect in every respect, and in case any part, except rubber bowl rings, brushes for cleaning and parts of like character, shall become disabled within one year, through actual wear or defect in construction and not on account of negligence or lack of care, such parts will be replaced by us without cost to the user.

It Does This.

Turns easier than any hand separator made.

Brings more dollars to the user than dairying in any other manner.

Saves much time in washing and handling, on account of its great simplicity.

Lasts longer and costs less to keep in repair than any other.

The **EMPIRE** has proven a marvel in Cream Separator Construction and results obtained through its use have astonished experts and appalled competitors. Never has a Cream Separator won so many staunch friends solely on its merit. It is not "the only" Cream Separator on the market but it possesses many features of advantage found in no other. Our catalog tells all about it and gives much information which will interest you. Let us send you a copy.

FEEDS AND FEEDING
NEXT WINTER it will be necessary for our farmers to study the question of stock foods. Corn, the great stock grain, will be high in price, and substitutes must be provided for it. How can these substitutes be found? Only by comparing other and cheaper foods with corn, and knowing beforehand how they will affect the animal. This comparison may be done by studying analyses, but a farmer cannot afford to spend the Winter in experimenting. He must know beforehand what others have found out. He can learn this by studying Prof. W. A. Henry's great book. Feeds and Feeding tells you just what you ought to know about foods and how to feed them. It is full and complete, and easy to read. Price, $2.

WORKING THE WIND DOWN HILL.

HARD JOB AT LIFTING WATER.

Is an Engine Necessary?

We have the following question from a reader in Pennsylvania:

A large spring is located near the foot of a steep hill. Wind is not available near the spring, but is at the top of the hill. From the spring to a point where the windmill would stand is 200 feet of about 100 feet rise. The hillside is nearly straight, ascending at an angle of about 45 degrees. Is it feasible to locate a windmill at the top of this hill, and pump the water to a soil reservoir near it? If so, what form of pump should be used, how large a pipe, and what gearing should be used on the mill?

Oscillating Rods on Pump.

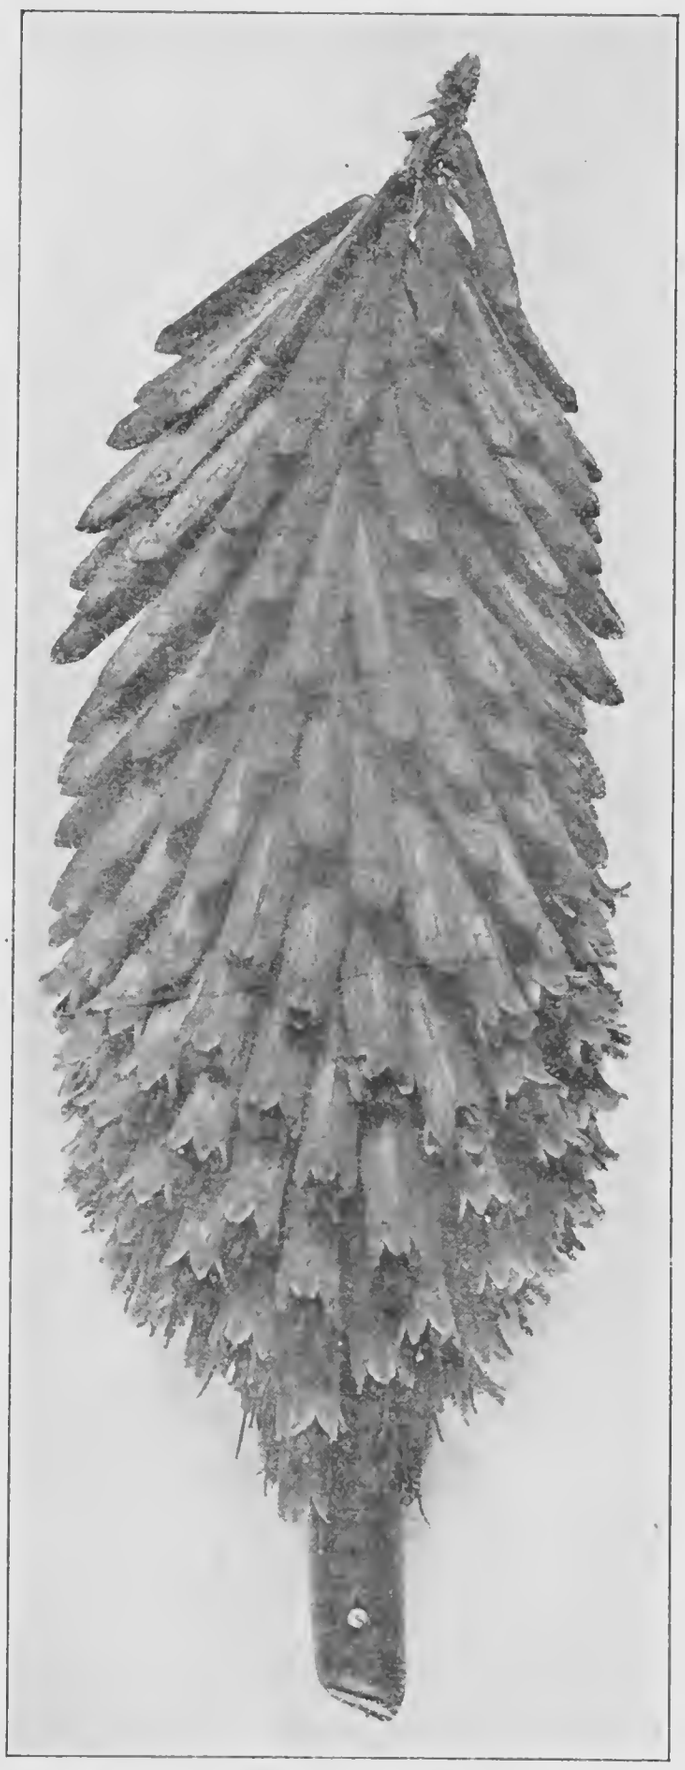
It is entirely feasible to locate a windmill on top of a hill, and by appropriate attachments operate a pump at the spring at the base of the hill 200 or more feet away. Probably the best means of transmitting the power from the windmill to the pump will be the device generally known as the oscillating rods, see Fig. 318. The actuating rod of the pump is connected with the horizontal arm of a T, to the two ends of which wires are attached. These wires extend from the tower to near the pump, where they are connected to similar arms on another T, the horizontal arm of which is connected with the pump. Thus the motion of the actuating rods on the mill is communicated to the piston of the pump; the wires pulling alternately on the upper and lower arms on the Ts. A pump to be suitable for forcing water to a height of 100 feet must be strong and well-made. It would seem wise to submit a statement of the work to be done to the makers of the windmill that it is expected to use, and they will be able to recommend the style and size of pump, the size of pipe, and the connecting apparatus that will be best suited to accomplish the work required. The writer of this has frequently seen power transmitted to longer distances than that mentioned by our correspondent, but he has not observed a case where the water was raised to the same height and is therefore not prepared to state upon his own experience and observation just the style of pump best suited for this work. J. L. STONE.

An Engine at the Spring.

The only way to accomplish this is to force the water from the spring into the reservoir on the top of the hill by some mechanical arrangement that will be easy, simple, effective, and always ready for work. As a matter of economy the source of the force must be near the work, so that waste of power is avoided. The force, too, must be always under control. The windmill suggested would evidently not fill the requirements, for the power must drive, it cannot under the circumstances draw the water, taking advantage of the air pressure, and it would make it necessary to convey the power by some means from the hill to the spring, and then make it work there. Now it will be evident that there will be a loss of power and an increase of expense in thus doubling the work. It follows then that the force must be applied where it will do the most good, and this is at the spring. The question then is, what will be the best means of getting this force? I think there will nothing better be found for this work than a small gasoline engine, set up in a sufficient shed at the spring and a force pump attached, with whatever pipes may be required to carry the water where it is wanted. As the elevated ground will be a good place for the cistern it should be placed there, and the water may then be distributed by gravity wherever it is needed. The required engine I find is described in the business columns, to which reference may be made. It might be suggested that as the capacity of the spring is not mentioned, if it is not sufficient to keep the supply for the pump up to the requirements of the pipe, which should not be less than one inch in diameter—and 1½ would be better on account of less resistance to the flow by friction—it might be desirable to have a cistern at the spring to collect the water during the intervals of pumping, and thus economize the use of the engine. H. S.

He Finds Another Spring.

Some weeks after the first question was asked we received the following letter from the farmer who



KNIPHOFIA (TRITOMA) PFITZERII. FIG. 317.
See Ruralisms, Page 710.

asked it. This shows that it pays to investigate our home resources:

"I think that an arrangement could be worked by wires as is sometimes done, though it might cause some annoyance. Still another method would be to run the water farther down into the valley, where wind could be had and force it from there to the hilltop. However, I think I found a better solution than either, after sending the problem to you. There is another spring back in the center of the farm, but I was afraid it would not furnish water enough, it apparently being much smaller than the one referred to. Last year was an unprecedented drought in that region, so that it was a good time to examine it. There was only a little water running from it, and it is so conveniently located that it cannot well be spared where it is, for we can use almost any field for pasture, and still give the stock access to this spring. I took a shovel and pick and a pail one day and went up there. I took out the stone which had been laid around it, and dug out some of the mud and gravel which had accumulated in it. I then dipped it out and went on cleaning it out still more with the shovel. In about 10 minutes I dipped out 30 gallons more. I waited about five minutes and dipped out about 20 gallons, and in five minutes more I dipped out another 20 gallons. Of course there was nothing accurate about the amount, but it was near enough for practical purposes, and I concluded that even in that very dry time the spring would furnish more than 5,000 gallons a day. A fine stream ran in, but in the condition it was in most of it leached away below the surface. I knew that this spring was high enough to run to the buildings, but I was astonished when I came to test it with a level to find that it is at just about the same height that a reservoir would be on top of the hill, where I had thought of pumping the other spring. I never would have believed it without the level. The water is not so cold as that in the other spring, but is clear, pure and soft. It will only take about 800 feet more of piping than the other spring, and the ditching, rod for rod, will be much less expensive, with no need of a windmill or pump. There is considerable interest in prospecting for oil in that immediate vicinity now; much of the land is leased and several wells have been put down about four miles away, but I believe that I was as much delighted to find that spring in the condition that I did as I should have been to find an oil well on the premises. A lack of water has always been one of the great drawbacks of the place, but a little outlay will give all the advantages afforded by city water, and from a much better source than city water usually comes from. The worst trouble is to find money enough to do all these things that are needed."

A GOOD WORD FOR WINDMILLS.

Your correspondent, W. W. Stevens, page 675, advises farmers to use gasoline engines for power in grinding feed, cutting corn fodder, etc. The gasoline engine is a good and cheap power all right, but I have a windmill that is cheaper than gasoline, and quite as efficient in a *good* breeze. Mine is a 12-foot, galvanized steel mill, mounted on my barn. It is capable of grinding feed and cutting stalks at the same time. It is found that by taking advantage of the wind, when it is "on tap" that it will do all the work required by simply letting the mill swing into the wind. I should hesitate to put a gasoline engine in my barn or advise my neighbors to do so. The gasoline is too much like gunpowder; tolerably safe in careful hands, but dangerous to the careless. "A good servant, but a hard master."

I use a gasoline engine to supplement a windmill for pumping water from the Niagara River, for use at the barn and general purposes. This engine and mill are located near the river. The engine is used only occasionally, when the wind is weak or "contrary," and the reservoir is exhausted.. I am not advertising windmills of any kind or description, but when I have a good, willing servant, economical and safe, I think it well to say a good word for it. It is not necessary to mount the mill on the barn, it might preferably be on a steel tower contiguous to the barn, where the power is wanted. This power is not portable, of course, but my neighbors avail themselves of it for grinding grain. W. H. W.

Youngstown, N. Y.

R. N.-Y.—We know of gasoline engines which have been run in the barn with perfect safety.

A REVIEW OF "CHEMICALS AND CLOVER."

Is Stable Manure Absolutely Necessary?

I have been reading the pamphlets on "Chemicals and Clover" and "Fertilizer Farming," and would ask whether you still maintain the same positive position that you took at the time of writing those articles? I have somehow obtained the impression that you have modified your ideas as to the ability of chemicals to maintain fertility without barnyard manure. I have not been a subscriber to THE R. N.-Y. a year yet, so do not know what you may have published on this question during the eight or nine years past, but in the three or four other agricultural papers of which I am a pretty thorough and constant reader, and in the considerable number of different books—modern publications—by prominent agricultural writers, which I have bought and read, I do not find this plan of depending upon chemicals alone advocated. But I do notice the advocacy of the keeping of stock to increase the fertility of the land by almost all our leading writers to-day. This matter interests us very much, because we own large areas of naturally good land which are too far removed from our barns and stock to think of carrying stable manure to them—much better land in fact than on the home farm, and we would be glad to see some of it cultivated. We do not feel it practicable to put up barns one, two and three miles from home just to make manure for those lands. This year we have put in a number of acres of corn on one of these isolated tracts, and used simply acid phosphate and murlate of potash; also potatoes with chemicals along. All the crops are looking fine—all on land which has for the most part been used for pasturage and probably not plowed in the past 15 or 20 years. Our programme is to sow rye or wheat this Fall on all this ground, stock with clover in Spring, and cut rye or wheat for hay or soiling, the same as we have done this year on last year's corn ground, but the question in our mind is, can we keep this thing up and maintain the productiveness of the land or improve it? We don't find encouragement that we can do so for long, from the many writers in the agricultural press of to-day. If the plan set forth by you in 1892 was correct, why has it not been tested and proven so by our many experiment stations, and advocated by them also? A. G. T.

Willimantic, Conn.

We feel just as confident as ever that the plan of farming outlined in "Chemicals and Clover" is practical. Since the original articles were printed we have had considerable experience with Crimson clover and cow peas—two crops specially useful in connection with chemical farming. We have also come to realize the great necessity of utilizing the feeding value of the cornstalks by means of the silo, or the dry stalk shredder. This will mean more live stock than was contemplated in the original plan.

For the benefit of newer readers let us briefly review "Chemicals and Clover." The farm described was that of D. C. Lewis, at Cranbury, N. J. It was, and is now, conducted on a five-year rotation. The sod is plowed for corn, the season's accumulation of manure being spread on the sod before plowing. Under the old system the corn land lay bare through the Winter, and in the Spring was plowed and planted to potatoes with a heavy application of a complete potato fertilizer. Now Crimson clover is sown at the last cultivation of the corn. This gives Fall pasture and may be plowed under for potatoes. Early varieties of potatoes are grown, and they are dug in time to seed the ground to wheat with Timothy grass—Red clover seed being added in the Spring. Frequently more fertilizer was used on the wheat. The grass following the wheat is cut twice, and then plowed for corn, thus bringing the rotation around in five years. The keynote of this rotation was the crowding of all the manure upon the corn, and all or nearly all the fertilizer upon the potatoes—the wheat and grass being expected to grow upon what was left in the soil by those two most important crops. This rotation was highly successful, and results clearly demonstrated the fact that a high-grade fertilizer in connection with the roots and stubble of grain and grass will make a complete substitute for stable manure. There are plenty of cases where little manure is available, and yet year after year good crops are grown.

But does not Mr. Lewis now keep more live stock and thus use more manure on his farm?

Yes, he has six or eight more cows now than when the "Chemicals and Clover" articles were first written.

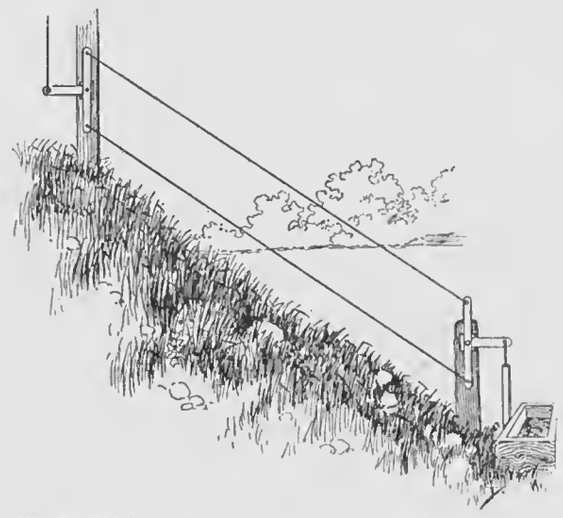
Does not this prove then that the chemicals were found wanting—that stable manure was necessary after all?

No, because Mr. Lewis did not increase his herd of cows for the sake of the extra manure, but because he felt that it was good business to save the feeding value of the cornstalks. When we first wrote about the farm these stalks were regarded as more or less of a nuisance. Some were fed whole, and many were thrown into the barnyard to be trampled down by the stock. The wheat, the corn, the hay and the potatoes were all salable at fair prices, but the stalks were not a cash product. The cows were kept to give value to the stalks, because it was found that in farming, as well as in every other business, success means making the cash sales as large as possible. When the stalks were put in a silo or run through a shredder when dry, they formed the roughage for a cow's ration and with bran and cotton-seed meal added, made milk for the creamery. We have described this change in the disposal of the stalks as it came about, and this has led some readers to say that the theory of "Chemicals and Clover" has broken down in practice. That this is a mistake may readily be seen when we reflect that the only addition to the manure supply is the grain now bought for the cows. The cornstalks and wheat straw are now cut fine and fed, while formerly they were mostly used for bedding, or tramped into the mud. This will make it clear that it is not because the chemicals failed that the extra cows are kept. Hay and grain can usually be sold for a fair price, and it is often good policy not to try to feed them out at home. The selling price of cornstalks rarely equals their feeding value, and where corn is necessary in a rotation it will usually pay well to cut or shred them for feeding. We regard shredded stalks as nearly equal in feeding value to Timothy hay, yet, if they could be sold for half the price of the hay we do not believe that Mr. Lewis would ever have built his silo.

The plan you mention of growing crops on fields so far from the barn that manure cannot profitably be hauled to them is, in our opinion, a reasonable one. It is the plan we are following on the back fields of our own farm. Reasons for believing that these fields may be maintained with chemicals and green crops will be given next week.

A CHAT ABOUT COVER CROPS.

This orchard cover crop business interests me immensely. It is of greater importance to the fruit tree than is realized by the fruit grower. We have much to learn. We cannot generalize on this subject as much as on many others. A cover crop good for apples may not suit pears, and may be away off for peaches. A cover suitable for sandy soil may not catch well on clay. Some plants are shade-enduring, while others in deep shade give up the struggle and the ghost without a kick. One thing is clear to my mind, the orchardist who neglects cover crops is losing money, either through unfavorable soil conditions engendered, and weak tree conditions induced, or, on the other hand, in the purchase of barnyard fertilizers which are imperative under the system which does not employ them. To my mind again, the introduction of green manures into the orchard is bound to bring about a change of ideals respecting distances of setting the trees. In a recent trip through western New York, the two best orchards, bearing the best apples seen this Autumn, were standing, so that at 40 years of age one could drive comfortably between the rows, without dodging to avoid switchings or scratches. One was 60 feet apart, the other 50, both Baldwins. No cover crop with which I am acquainted succeeds in dense shade—well, I ought to except chickweed, and I am not sure but it is a friend of the fruit grower. It grows late into Autumn and begins business early in Spring, but like "pusley," it is mostly water.



WORKING A PUMP WITH A WIRE. FIG. 318.
See First Page.

Regarding the relative merits of the various plants suitable for cover-crop purposes, I do not feel competent to express definite opinions. Cow peas usually do better the second year than the first. Often the first year's cover is uneven. Perhaps the soil lacks the particular microbe necessary to their full development. Certainly the cow pea is one of the surest crops for midsummer sowing. I have seen many fields during the past two weeks, which were sown with cow peas in July or early August, now covered with a dense mat of vegetation at least a foot thick. Last night's frost left the Cornell plots shivering under bare stalks. The leaves drop, and are mostly collected by the stems, to be sure, but some loss of vegetable matter will undoubtedly occur before plowing time next Spring. The cow pea is an excellent plant to begin the work of soil regeneration with. Its germination is reasonably certain and growth rapid, but it does not love shade, and it is not partial to heavy clay. With the ground in a good state of tilth, which implies the presence of humus in reasonable quantities, I believe other cover crops may be used with greater advantage. Hairy vetch does not make much of a showing at first—it may even be quite obscured by weeds—but when the frost cuts the interlopers the vetch looms up and sticks to the business of growing right along whenever a favorable opportunity occurs. It has done better this year on sandy loam than on stiff clay.

By far the most striking orchard cover I have seen this year was secured by sowing Alfalfa on heavy sandy loam the first week in August at the rate of 22 pounds per acre. This was in the western part of Monroe County. Growth was exceedingly uniform and the plants averaged a foot in height. The growth was weak beneath the trees, but the plants were there in great numbers. The ground is to be "ganged" early next Spring so that no trouble will be experienced in clearing the ground. Good catches of Crimson and Mammoth clover were noted in orchards in several places. Some enterprising man should set to work and grow a lot of vetch seed. It is now scarce and high-priced. When a fruit grower obtains a start with this plant, he can easily grow his own seed by maturing and harvesting a part of his cover crop each year. Finally, it is true economy in sowing cover crops to be generous in the amount of seed sown rather than niggardly. JOHN CRAIG.

Cornell University.

EXPERIENCE WITH MELON DISEASE.

I note with interest the article on fighting Melon blight on page 611, and I am prompted to tell my story, for we grow a melon or two here—or try to. Last year our Rocky Fords were strictly No. 1. We could warrant almost every melon, and we sold at a good price all we had. The seed was good, from Colorado, and the stock true. We also grew Emerald Gem and Miller's Cream, but being red-fleshed melons they were grown some distance away from the green-fleshed Rocky Ford. Brown spot first appeared in the Millers just as they were coming into ripening, and, of course, "fixed" them. Most of the Rocky Fords had already been picked and sold, but a second planting was just coming on. The blight spread from the Miller to all the rest. Now these first Rocky Fords were far and away the finest melons we had had in some years, and seed was saved from specimens of *perfect* quality and type for the next season's use. We and our friends eat a great many melons right here at home, and the refuse goes—or did last year—into our compost or manure heap. In this way hundreds of bad melons, Miller's Gem and Rocky Ford, went into that compost.

When this season opened various people began to ask if we were going to grow melons this year. We thought we saw a "snap," and laid out for some thousands of them. We prefer a good compost for melon growing; a big shovelful in a shallow hole a yard across, and thoroughly worked into the soil with a fork and covered up. That compost of last season was the melon manure for this season. Is there any connection? The seed was planted, and came up every one, and as they grew were carefully cared for, but from the start they were an obstinate lot. On good melon soil they ought to have thriven—but they didn't. When quite small the plants developed a curious yellowish edging on the leaf, sometimes occupying one-third of the leaf, and the leaf had a harsh, stiff look and feel. Dry and hot June might be accountable for a part of this, but it did no better when rain came July 3. Downy mildew kept working at them, and a thorough spraying with 1-to-12 Bordeaux seemed to check that, but still that harsh, yellow, unthrifty look. Some of them were given a good dose of fertilizer high in nitrogen (on part clear nitrate of soda), but it did not help materially. They grew, mostly covered the ground, set melons, and we picked them—some of them—but not an eatable melon in the whole batch. August 20 brown spot, or Alternaria as I suppose, appeared, and August 24 saw the whole lot a brown blasted mess. There were four kinds of melons in the field—Norfolk Button, Shipper's Delight, Rocky Ford (our own seed), and a few Emerald Gem (our own seed). The Gems were the best in quality (?), the rest—squashes. Most of them are on the lot yet.

Now then! Did the blighted melons last year in the compost have anything to do with the unsatisfactory growth this year? A watermelon patch touching them on one corner—and by the way, watermelons have usually blighted with us badly and early—planted on manure from another pile, and free from all bad melons, is a shining success, and on September 20 was green and thrifty. Summer squash, 200 hills, and about 500 hills Hubbard and Faxon, planted on that same old compost were a flat failure—behaving just like the melons—the only failure we ever had with Summer squash. Spraying did them no good whatever. This year we were just a little careful where the waste muskmelons went to—they are *not* in the compost heap. There hasn't been a really good muskmelon grown in this section this year to my knowledge, and many are still on the ground. Did the growers "inoculate" their manure as I did?

Milford, Conn. GARDENSIDE.

HOW TO MAKE A FUMIGATION HOUSE

So as to Distribute the Gas.

PART I.

In THE R. N.-Y. for January 6 and February 3, 1900, appeared two excellent articles by Prof. W. G. Johnson concerning the use of hydrocyanic acid gas for the fumigation of nursery stock in fumigation houses, and for use in the greenhouse. These articles clearly show the value of such fumigation, and the reader is referred to them concerning the details of the operation. The fact that a certain strength of gas (25-100 gram per cubic foot) will kill the San José scale upon nursery stock in the fumigatorium, rests upon the observation of various entomologists that at that strength it will kill practically all the scales on an orchard tree fumigated with that strength under a tent. In the fumigation of greenhouses it has frequently been observed by various parties that plants here and there are more injured by the gas than others of the same kind and character, and it has been supposed to be due to the "banking" of the gas in certain places, caused by the slow and incomplete diffusion of the gas. This has never to my knowledge been definitely demonstrated to occur in greenhouses, but it seems a plausible explanation of the different amount of injury in different parts of a house. If such a lack of diffusion occur in a greenhouse it would lead one to question whether complete diffusion of the gas is ordinarily secured in a fumigation house when packed full of trees. During the past year the chemist of this station, C. L. Penny, and I have made some experiments upon this matter which throw some light upon the manner in which the gas diffuses, and the necessity for more care in the construction and management of fumigation houses.

A large room approximately 20x20x11 feet was fumigated with 25-100 gram potassium cyanide per cubic foot, and after allowing the gas to remain for different lengths of time, samples were drawn off from various parts of the room. The position of the vessel in which the gas was generated was also changed to show the difference of diffusion caused by its position. Three samples of the gas were drawn off at once, one from the ceiling of the room and two from points on the floor. Without going into detail concerning the procedure and results, the experiments showed the following facts: If the generator were placed in one corner of the room it required from 30 to 60 minutes for the gas to become thoroughly diffused throughout the room. After 20 minutes a sample taken next to the generator contained but 27 per cent of the normal amount of gas, whereas a sample taken one foot below the ceiling at the center of the room contained 87 per cent, and one taken on the floor at the corner opposite the generator 94 per cent. At 30 minutes the amount of gas at the last two points was about the same, but near the generator was found 51 per cent of the normal, or nearly double that at 20 minutes. As the gas is generated it is seen to rise to the ceiling, and pass toward the opposite corner of the room, and the analyses show that this is the course of its diffusion, for 10 minutes after the gas was generated the amount next to the generator was a mere trace, less than one per cent. When the generator was moved to the center of the floor, the intakes remaining at the same places, after 10 minutes there was found 75 and 88 per cent in the two corners and 123 per cent in the center of the ceiling, which is in general agreement with what was found before, the greater part of the acid vapor rising to the ceiling. At this rate with the generator in the center of the room, the gas would probably become completely diffused in from 20 to 30 minutes. With the generator placed in the corner, and taking samples from the middle of the room after 20 minutes, one sample from the floor, one midway to the ceiling, and one at the ceiling, it was found that practically the same amount of gas occurred at the ceiling and the middle point, but only about one-third as much at the floor.

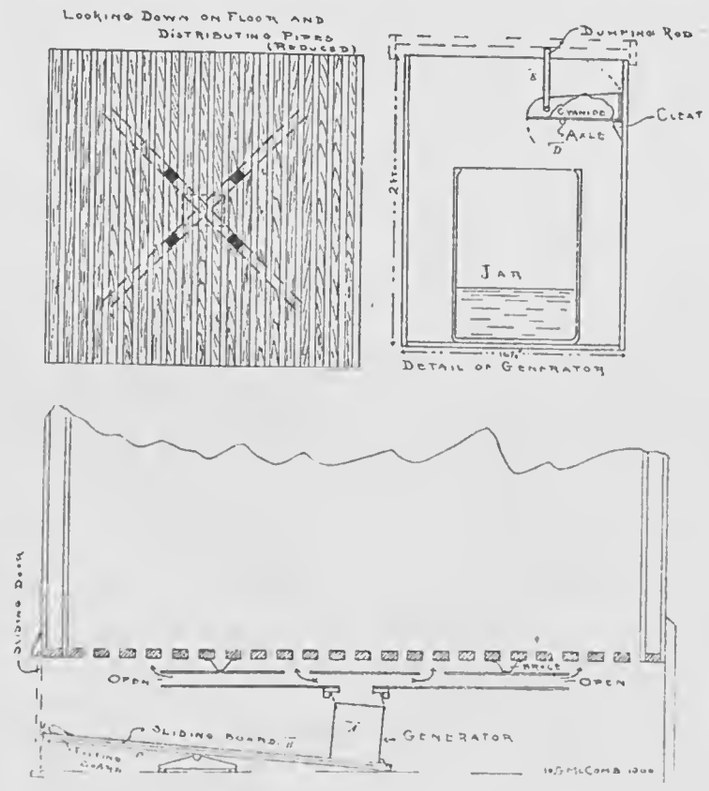
These facts seemed to indicate that some method whereby the gas might be set free from several points would greatly aid in its ready and complete diffusion. To accomplish this a tin hood with a pipe leading from either side was placed over the generator. The generator was placed two feet from the middle of the south wall, and the tubes reached three-fifths of the length of that side of the room. The tube was open at each end and was punctured by two holes equidistant from the ends and each other, thus giving four apertures for the escape of the gas, at equal distances along one side of the room. With this arrangement the gas was perfectly diffused in 10 minutes—possibly sooner than that, for that was the soonest samples were taken. The more perfect diffusion with such a distributing apparatus was strikingly shown by the difference in the effect of the gas upon guinea pigs. With the generator placed in the southeast corner a guinea was placed on the floor about the middle of the east wall. The animal did not die until 37 minutes after the generation of the gas, which showed very clearly the imperfect diffusion of the gas. When the generator was placed at one side of the room and covered with the hood and distributing tube as described above, a guinea pig was placed in a cage in the northeast corner of the room, and about seven feet above the floor. This animal commenced to feel the gas about two minutes after the generation and died 15 or 20 seconds later. At the same time a guinea pig and a rabbit were placed near the middle of the east wall (the generator being at the middle of the south wall). The guinea pig lay on its side for five minutes and was dead 10 minutes after generation, while the rabbit was unconscious in 30 seconds and died four minutes later—the difference in time being due to the physiology of the animals.

Delaware Exp. Station. E. DWIGHT SANDERSON.

BUGS AND BLIGHT ON LONG ISLAND.

F. A. Sirrine, entomologist at the Jamaica, L. I., branch of the New York State Experiment Station, recently gave a R. N.-Y. representative the following facts from his observation of insects and plant diseases during the present season:

ASPARAGUS CONDITIONS.—The rust has not been so bad as usual this year on the cutting fields. It started in new-set beds in June, and in most cases it has continued, but on the cutting beds conditions were such that it did not get started, and they remained green until the latter half of September. This is probably due to the excessive rains just after



APPARATUS FOR FUMIGATING WITH HYDROCYANIC ACID GAS. FIG. 319.

the cutting season, which prevented the spores of this disease from getting a hold on the foliage of these beds. Damp and foggy weather are favorable for the spread of rust, but by its mechanical effect heavy rain washes off the spores. The old, exhausted beds are not going to recover very much, but seedling and newly-set beds that escaped the rust last Spring are making a vigorous growth. The fields at Mattituck in which for two seasons alternate rows were sprayed and left unsprayed show a slight difference in the foliage. The yield on the sprayed rows was double that on the unsprayed, although the product of the whole field was less than formerly, on account of the decrease in the unsprayed rows. A farmer near Mattituck, by careful cultivation and spraying for two years in succession with resin Bordeaux Mixture, harvested the present year from one acre 2,000 bunches, bringing him about $450 in excess of cost of fertilizer. Nearly all asparagus growers on the Island who spray use the resin Bordeaux.

CABBAGE WORMS have not thus far done so much damage as usual in the cauliflower section. They appeared in the latter part of August, and quite a number have been spraying with arsenicals, most of them using the dry-powder gun. I have noticed that in a section where Cabbage worms are so thick that the growers lose nearly all their late cabbage, this section may be comparatively free the next year, while on the margins and in adjoining districts the worms are very destructive. This is because where the worms are thickest the parasite enemies are most numerous, and the scattered worms on the margins are those that escape and produce next year's crop. The Fall web-worm has done considerable damage at the western end of the Island this year, but the parasites are active, and the English sparrow is also getting after them rapidly as they leave the webs. These sparrows are great consumers of the Pea louse.

CAULIFLOWER ROT BLIGHT.—We have not succeeded in finding any effective treatment for this troublesome disease. It shows first on the edges of the leaves in a papery appearance, especially around holes that have been bitten by worms. It works from the leaves to the shank, after which it spreads upward into the center of the head, and frequently is not seen until the head is cut open and the black spots are found inside. This is a bacterial germ, and the treatments we have tried have been spraying, and picking and destroying the diseased leaves.

MELON BLIGHT.—I heard the other day from Holmes Bros., of Ypsilanti, Mich. They sprayed their plants this year before transplanting, and continued to spray every week after transplanting. They have had but little blight, and report that even the last settings of melons are maturing properly. The muskmelon crop on Long Island was an entire failure on account of blight. From the study of the disease in this section I am convinced that the so-called Alternaria is not the cause of the blight here, but a secondary disease which occurs on leaves which have become weakened from other causes. The destructive disease which cuts the plants down so rapidly is the Downy mildew of the cucumber. Spraying with Bordeaux Mixture is the only means of prevention that we know of.

SAN JOSE SCALE.—We have made numerous experiments in spraying with crude petroleum, but the results have not been generally satisfactory. In one test of crude oil on pear trees sprayed in April before the buds showed signs of swelling, both fruit and leaf buds were killed, and the trees had to develop latent buds. This was true where both the 25 and 50 per cent mechanical mixture of oil and water were used. In case of the 25-per-cent application a few flower and leaf buds survived the treatment. We find it difficult to hit all of the scale, particularly under the edges of the buds. A peach tree sprayed with a 25-per-cent mixture in December was killed outright, while another sprayed in the same manner in April was not hurt. Probably the reason for this is the fact that, when the tree is dormant in Winter, the wood absorbs the oil, while, when the sap is flowing freely in Spring, the wood is resistant to the oil.

CO-OPERATIVE LAUNDRIES FOR FARMERS.

In many ways customs and conditions pertaining to the farm home have revolutionized the past quarter of a century. Important changes for the better have been made along many lines. As regards the household wash, however, but small progress has obtained. About the same unpleasant conditions prevail as did 30 years ago. True, nearly every home has numerous machines of various designs intended for affording help, but in the main, they are all discarded and the bulk of this important work is done in the old disagreeable way.

Is any remedy possible? We think so in many instances. Many rural districts have coöperative creameries. These with their power and conveniences do, on a grand scale, a work that was very disagreeable to do, on the individual farm. So done, such work is exalted, dignified as a business enterprise, and ceases to be disagreeable. Why not add a laundry department and apply business principles to raise another important work from the drudgery it now entails? The creamery and laundry plants possess many essentials in common, viz.,—steam power, water supply, drainage and a system of collection and distribution of product. Provide each creamery wagon with an elevated (omnibus) deck, for the long, narrow, deep, household laundry baskets, and but little extra expense will ensue for distribution. That every creamery add a laundry department is not essential. Where a township or neighborhood has several, a laundry at one, centrally located, will probably suffice. The neighboring ones can act as distributing stations for the laundry output to advantage. For obvious reasons it may be well that as many of the patrons of the laundry as possible own stock in it. An important aim is to do enough business at each laundry established to reduce cost of work to the minimum. The solution of this question will aid materially in solving another serious problem that pertains to rural households, viz.,—the hired girl question (the city servant girl is the "hired girl" in the country). By eliminating laundry work from the household the equilibrium between supply and demand, regarding such help, will be restored in two ways. Many households that now require girl help can then dispense with it, and girls who now object to such service will have less cause for objection.

As to the practicability of such an undertaking as here outlined the future must determine. Personally, we are not familiar with the detail work of the steam laundry, basing our opinion wholly on the principle that work is more economically done with proper facilities, and on a large, rather than a small scale. That some attempt along these lines will be made in the near future we feel reasonably certain. No doubt, some localities are more favorably conditioned for starting such work than others. Success will depend largely upon the farmers themselves, their willingness to unite in coöperation and skill in organizing on a proper scale. FRED. J. FROST.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Shredding Cornstalks.

F. C. C., Sandy Creek, Mc.—We have an acre of yellow corn. The fodder being valueless to us, as we keep but one horse, I am anxious to know whether it would pay to purchase a shredder to work these stalks up for the horse, and then market our hay. What proportion of the shredded corn could we feed? I think I could hire a gasoline engine. How long does it take to shred an acre?

ANS.—The shredders that really do effective work are quite expensive, and it would hardly pay to buy one for a single acre of corn. Some of the hand power machines split and crush the stalks, but the work is not by any means equal to that done by the large machines which run rapidly by strong power. Our stock eat all the lighter parts of the shredded stalk—leaving the pith and some of the tougher part of the butts. The length of time required to shred an acre of stalks will depend on the size of the corn and the way the stalks are dried. Well-dried stalks work through slower than the greener ones. We can handle 3,000 pounds an hour and not push the machine.

Storing Cabbage.

A. G. L., Auburn, Ind.—Will you inform me as to the proper way of storing or burying Holland variety of cabbage? I have quite an amount. Will the recent frosts we have had injure its keeping qualities?

ANS.—Our way is to cut the heads off the plants in the field, leaving no more leaves about the heads than if they were to be used or sold at once. They are then drawn and put into trenches made as follows: A sheltered place having very good drainage is selected. Trenches about three feet wide and one foot deep are made. Into these the cabbage heads are dumped about 15 inches deep. The earth is then plowed or thrown back upon them to the depth of eight or 10 inches. No straw or other covering is put on before the earth, as it causes rot. Should the cabbage freeze solidly it will not injure them, as the moist earth will draw the frost out nicely. Cabbage can be kept nicely in a cold cellar provided ventilation from below is given. If placed in bins with slatted bottoms about six inches from the floor they will often keep well, but are likely to dry out and weigh much less than when kept outside in contact with the moist earth. In some large cabbage-growing sections they lay the heads, cut from the stem as described, tops up, close together, one deep, and cover with straw or leaves. A well-sheltered piece of sod land is best for this method. A friend of mine uses a large compact orchard. The Holland or Danish cabbage will many times freeze solidly without damage. Freezing seems to improve the flavor. F. G. TICE.

Manure or Fertilizer for Strawberries.

L. R., Harwinton, Conn.—I wish to know how to handle a certain piece of land for strawberries. The land is a good deep soil which was plowed from turf last Summer; was given a fair coat of manure, but a large crop of corn was taken from it. I wish to set it to strawberries next Spring, but am afraid it is not rich enough. I shall not have any manure for it until Spring unless I buy it, and I wish to know which would be the better or cheaper, to buy manure at a fair price, or to use commercial fertilizers? Will any kind of manure do, whether made by hogs, hens, or the product of the barnyard? Would it pay me to sow rye now, to be plowed in in the Spring? When is the best time of the year to fertilize strawberries and raspberries, after being set?

ANS.—If we had that piece of ground we would plow it at once and sow rye. In the Spring we would plow the rye under early, and roll the ground after plowing. Then, with a light cultivator or harrow, keep the upper surface thoroughly fined until you are ready to plant. We would use a fertilizer—as heavily as we could afford. The fruit and vine mixtures made by the leading manufactures are good, or you can use a mixture made of one part (by weight) nitrate of soda, one part muriate of potash, one part fine bone and two parts dissolved rock. We would scatter this along the row before planting in a strip about 18 inches wide, and work it well into the soil. Then set your plants and keep them well cultivated. During the latter part of August use more of the same fertilizer, put about six inches from the rows, and well worked into the ground. We prefer chemical fertilizers for strawberries. So far as we know all forms of manure are suitable for growing the fruit, though horse manure is usually preferred. The fruit buds of the strawberry are formed during the late Summer and Fall, and the best time to use fertilizer is when the plants are set, and when the fruit buds are forming.

Short Course in Agriculture.

The Rhode Island Agricultural College at Kingston, R. I., will try an experiment this year in a short course of six weeks on "Farm Practice." The course will begin November 11, and end December 20. The following statement shows what the course will cover:

Soils and Fertilizers.—Origin, constituents and classification of soils; minerals and rocks of importance in agriculture; chemistry of manures; mixing, application, and use of agricultural chemicals; calculation of fertilizer formulas.

Soil Management.—Tillage, texture, moisture-content, humus, rotations, cover-crops.

Field Crops.—Management of representative farm crops.

Fruit Growing.—Location, site, planting, pruning, marketing.

Vegetable Gardening.—Market-gardening methods in field and under glass.

Live Stock.—Principles of feeding and breeding.

Agricultural Physics.—Weather, storms, frosts, atmospheric drainage. Mechanical laws applied to farm practice.

Drainage.—Principles of tile-drainage.

Plant Life—The plant and its environment; structure and functions of root, stem and leaf; reproduction; parasites. Laboratory work, including a microscopic study of injurious fungi.

Insect Life.—Types, transformations and habits of representative orchard and garden insects.

Woodwork.—Bench-work, joint-making; the use, care, and sharpening of tools.

Ironwork.—Forging, farm-blacksmithing, pipe-fitting.

Sanitary Science.—Heating, ventilation, plumbing, water supply, and sewage disposal.

Farm Business.—Farm accounts, letter-writing and general business methods.

Prof. F. W. Card will have charge of the instruction, which will be careful and thorough. We feel confident that any person of average intelligence will be able to understand fully what the college has to offer in this short course. It will occupy only six weeks in the early part of Winter and will be followed by a short course in poultry keeping. It is, of course, difficult to learn just what to try to teach during this short period. The college is trying to find out, and it seems to us that the course outlined above is an excellent one. We commend it to young men or old men who desire to know more about the "why" of agriculture.

The Cost of Clark Grass.

W. C. M., Grange, N. C.—Many R. N.-Y. readers, like myself, would be glad to know the financial side of Mr. Clark's grass experiment. That yield was wonderful, and an annual "cost" account would be most interesting. No doubt Mr. Clark keeps an itemized expense account, and would he not be obliging enough to furnish a condensed table of annual costs?

ANS.—Mr. Clark sends us the following figures, which, he says, is a statement of all the expense and income for seven acres of grass during 12 years. Part of the grass has been seeded for several years, but we understand that the $129 represents more or less work on all the land. As Mr. Clark uses 14 quarts each of Red-top and Timothy in seeding down, the 196 quarts of each seed represent the seeding of 14 acres. According to this it cost $9 to fit an acre as Mr. Clark wants it fitted. He used $1,314.50 worth of fertilizer in the 12 years, or $109.54 each year, or $15.75 per acre:

Labor intensely to cultivate the soil	$129.00
196 qts. Timothy seed	17.50
196 qts. recleaned Red-top	19.60
Sowing grass seed	14.00
3½ tons Fall dressing, $36 per ton	126.00
28½ tons Spring dressing, $41 per ton	1,168.50
Total cost of production	$1,474.60
Total product, 588 tons at $12 per ton	$7,056.00
Less total cost	1,474.60
Total profit in 12 years	$5,581.40

Mr. Clark figures the hay that he sold at $12 per ton, though he says that his average price has been $16. Referring to this year's total crop of hay Mr. Clark says: "I have previously given you the result of my first crop of hay, 1901, which was 79,490 pounds. I now have the second crop in the barn, which is 23,460 pounds. The total from the two crops this year from the seven acres is 102,950 pounds; an average of 14,721 pounds per acre. Certainly more than seven tons of well-dried hay per acre for the year. The total cut in 12 years from the seven-eighths-acre field is 96 tons 339 pounds. I could now get more hay by sowing new seed upon this section, but think that I shall continue another year or more to see how long Timothy and Red-top can be kept going with once seeding when each crop is fed with bone, potash and nitrate of soda."

Many a distressed sufferer from Lung or Throat trouble, who had lost hope under the false idea that his disease was incurable, has been restored to perfect health by Dr. D. Jayne's Expectorant.—*Adv.*

Reducing Bones; Warming the Henhouse.

D. R., Hardy, Del.—1. How much sulphuric acid is required to dissolve 100 pounds dry animal bone, and can it be done in ordinary wooden barrels? How long would it requlre? 2. Is it considered profitable to heat a henhouse with stove, using wood as fuel, and thus keep hens warm in cold weather? Wood as fuel on the stump is worth about 40 cents per cord here.

ANS.—1. We do not advise the use of sulphuric acid on the farm. It is very dangerous to handle, and unless the bones are first crushed quite fine 40 pounds or the acid will be required for 100 pounds of bones. The manufacturers have expensive machinery for steaming and grinding bones, and can do such work far better than the farmer can. 2. We doubt whether it would pay to warm a Delaware henhouse with stoves. In Canada this is sometimes done, but even in that cold country there is some question about the profit.

The Use of Hydrocyanic Acid Gas.

G. E. S., East Prospect, Pa.—I intend to fumigate my nursery stock. My room is 7 x 11 x 18 feet. Will you give me the amount of chemicals required?

M. B., Paterson, N. J.—I notice your article on hydrocyanic gas for rats in the issue of October 5. Have you any experience in the effectiveness of this gas, similarly used to clear a building that is alive with water bugs; that is, to kill the eggs and young bugs? I do not know how long it takes to hatch their eggs, but the building could remain closed up.

ANS.—The article on page 677 tells how to use the cyanide of potash. Your building contains 1,386 cubic feet. With one ounce of cyanide for each 200 feet you will need seven ounces. This will call for 10½ ounces of sulphuric acid and 14 ounces of water. The gas will probably not destroy the eggs, but it will kill all the insects that it reaches. As the water bugs stay or crawl into small cracks and crevices it is doubtful whether the gas will kill them all.

The English Lime Tree; Apples.

J. U., Los Gatos, Cal.—Give a description of the lime tree of England. Is there a tree in this country of the same kind but having another name? Also give me a short list of apple trees with low wide spreading tops.

ANS.—The lime tree of England is the common European linden, which is closely allied to our native linden tree, which is also called basswood, and is found in most of the Central and Northern States in the native forests. The European linden is a smaller leaf and has a more dense top, making it very nice as a shade tree. It is not so robust in its habit of growth as our native species. Among the varieties of the apple that have very widespreading and rather drooping branches are the Winesap, Minkler, Willow and Tolman Sweet. These varieties will all do very well in the Central and Western States.

H. E. V. D.

Making Manure from Muck.

T. B., Toronto, Canada.—I send a sample of soil taken from the bed of a pond near a wood, and would like to know whether it would be sultable as a fertillzer and under what condltlons. Should it be mixed with any manure, and if so, would you give directions for composting?

ANS.—We have no facilities for making an analysis of the muck. The Canadian Experiment Station at Guelph will doubtless analyze it for you. The sample looks like a good one, and we should use it freely. Bulletin 74 of the Maine Station (Orono) contains much information about muck. Mucks or peaty soils result from the slow and imperfect decay of vegetable matter—water plants and forest leaves. As they are but partly decayed they are sour, and the plant food is mostly insoluble. Prof. Woods, of Maine, examined 22 samples of muck taken in various parts of the State. When taken from the swamps or ponds some of them contained 86½ per cent of water, which is within one per cent of the water in milk! When thoroughly dried out these mucks varied all the way from one-half of one per cent of nitrogen to 2.85 per cent. The phosphoric acid varied from a mere trace to nearly two per cent, and the potash from a trace to nearly one per cent. This will show that the safest thing to do with muck when any large quantity is to be used is to send a sample to the experiment station and have it analyzed. The chief value of muck lies in the nitrogen it contains. This nitrogen is usually not available as plant food, and must be "cooked" or fermented before using as manure. In the bulletin already mentioned the following good advice is given:

> Some mucks ferment of themselves when thrown into heaps, and such kinds serve well as manures without weathering, fermentation or any kind of preparation. But the kinds most common in Maine are well-nigh useless as manures unless they have been rotted or fermented. In view of these differences it is not strange that farmers frequently deem mere exposure of muck to the air to be a sufficient preparation of this material. While this is the case with some mucks, the safest and surest way of obtaining good results with muck is to ferment artificially in the compost heap. Experience teaches that in many situations, a large proportion of the useful ingredients of dung and urine can be saved by composing with muck. It is equally certain through such composting the unavailable plant food of the muck is made available. The ferments are present in such amounts in farm manures that left to themselves they suffer by the fermentation, and most mucks are so deficient in ferments that by themselves the fermentation necessary to render their inert organic matter available will not take place.
>
> In the preparation of muck composts, dung or fish are the materials commonly used to excite fermentation. Most farmers prefer to make composts in heaps. A common plan is to lay down a bed of muck six to eight feet wide and a foot or so thick, and cover it with a layer of dung of somewhat less thickness, followed by another layer of muck and so on. Different farmers use very different proportions of muck. The ordinary practice seems to vary from one to five parts of muck to one part of dung. Rich dung from stall-fed cattle will ferment more muck than that from animals less highly fed. The practical rule is to use no more muck than can be thoroughly fermented by the manure. In the case of sour muck the addition of small amounts of lime or wood ashes will correct the acidity and hasten fermentation.

EVERYBODY'S GARDEN.

POSSIBILITIES OF THE SMALL GARDEN.—It is often very difficult for the owners or occupants of small grounds to see that anything in the way of flower or vegetable growing can be accomplished, and chiefly for the reason that their grounds are small. Hence it is that the back yards of so many suburban and village homes are merely grass plots, or worse still, only weed and rubbish patches. If these idle yards and vacant spaces were only devoted to the useful and beautiful, if the boys and girls were encouraged and carefully taught how to make them thus, the parents would be spared many heartaches. Heartaches over the waywardness or vicious habits of their children who are thus, simply because they are actually starving for something to do.

Now what can be done with the small yards? One instance of what has been done may perhaps solve the problem for many others. In 1892 our home was a six-room cottage on a lot 32x105 feet with shed 16x20 feet occupying the rear end of the lot. The entire space between the house and shed was 32x45 feet, with a brick walk 2½ feet extending the whole length, and a grass plot 14x20 feet, which must be deducted. Exclusive of potatoes and sweet corn, that space, what little there was, furnished the entire vegetable supply for a family of three adults and considerable company as well, for the entire Summer, besides much given away and considerable more put up for Winter. Did we eat anything? Well, the male gardener always managed to tip the beam at over 200 pounds, while the female florists never went hungry longer than to prepare a meal, and as to visitors, they ate and returned, and "further, deponent sayeth not."

WHAT WAS GROWN.—In vegetables, we had onions, radishes and lettuce to eat and give away; beets and cabbage, peas, two varieties, both to eat and cheer our neighbors with; Lima beans, a plentiful supply for use while green, and some to store for Winter; sage and parsley in abundance; Fordhook squashes, and tomatoes for the Summer, and the entire Winter supply for canning. Upon taking possession of the place, we found already growing one large clump of lilacs, one two-year-old peach tree, six currant bushes just coming into bearing, and a strawberry patch from which 12 quarts of berries were picked. In vines, we had cinnamon, wild cucumber and morning glories in profusion. In flowers (perennials) were ferns and wild flowers, Sweet William, larkspur and hollyhocks. In annuals, Phlox, Petunias, Salvia, mignonette, Asters, balsams, nasturtiums, pansies, Ageratum, sweet peas, candytuft and pinks.

The shed, with runway on the common, was used for the hens, from which came the egg supply, and two sittings sold at $2 per sitting, and 13 finely-bred chicks. This may seem a fairy tale, but it was actual experience, and not theories figured out on paper as possibilities. Much of the work was done in a hap-hazard sort of way, with hardly a thought as to what might be accomplished. Much more might have been done, with careful attention to rotation, the help of a hotbed, and the idea of keeping every foot of ground constantly occupied and at work. The results are given not boastingly, but simply to encourage and help others to do as well or even better than we did. I was a man, at least, in years and stature. My wife and sister, though neither of them very large, were nevertheless women. The boys and girls with proper encouragement and a little practice can do equally as well. They are the ones I am after, and I want the help of the fathers and mothers to get hold of them.

THE HOME SCHOOL.—Just here I must be pardoned for referring to the little school at Hope Farm, mentioned on page 679. As I write I wonder whether the parents of the other "little folks" fully appreciate their privilege? I hope so. While reading of the little school, my wife remarked that she fairly coveted a home down by Hope Farm that our two little girls might bring the number up to nine. She said she would go down on her knees to the Madame for the *privileye* of placing our little ones under the careful eye of a Christian mother and teacher during the hours they were absent from us. I said "Amen" with a very strong accent, for such schools and such teachers are rare and hard to find. The baby's first steps—whither do they tend? The seed sowing in the first few years—what shall the harvest be?

J. E. MORSE.

NOW IS THE TIME.

Seasons change. We can't change them. We can't prevent the coming of cold and damp airs.

But we can prevent the sore throats, the coughs, colds and lung troubles by taking Scott's Emulsion. Nothing does more to make the tender throat tough. Nothing gives such strength to weak lungs.

Don't take risks—when it's easy to be safe. Now is the season for taking Scott's Emulsion in season.

We'll send you a little to try, if you like

Ruralisms

NOTES FROM THE RURAL GROUNDS.

THE KNIPHOFIA OR FLAME FLOWER.—There has been much activity among German plant breeders looking to the improvement of the Flame flowers, usually catalogued in this country as Tritomas, but more correctly known as Kniphofias. About 10 species are recog-

ONE TYPE OF ABNORMAL DEVELOPMENT.
FIG. 320.

nized, all natives of Africa and the Island of Madagascar. They look much alike when growing, and differ chiefly in hardiness and stature, though two species, K. Leichtlini and K. comosum, from tropical Africa, have yellow blooms instead of the usual orange red or flame color. They are among the least hardy and useful of the genus, however, as they can only be grown successfully with glass protection in the North. The best known species is K. aloides, much advertised with us as Tritoma uvaria. It is the Red-hot poker plant of old gardens, and now comes in many varieties and named sorts, which generally turn out to be very similar when bloomed. We have squandered much time and money on these so-called novelties with very little result. The coloring varies from brick-red, through the typical flame color to dingy straw yellow. Some of the flower heads are bunchy and ill-formed, and others twist badly during development. The best of all the new kinds, and a very desirable garden plant in every way, is Kniphofia Pfitzerii, shown on first page, Fig. 317. The cut shows an average flower spike of this excellent variety, one of six produced consecutively over a period of as many weeks, from the middle of August to October 1, on a young plant of this season's growth. No other Flame flower in our experience blooms so profusely or possesses such a neat and compact habit. The coloring is very fine, and may be defined as brilliant orange scarlet, shading to rosy salmon on the immature florets. They are very fine for cutting, and are now being used with increasing frequency by florists. None of the Kniphofias may be considered hardy north of Philadelphia without careful protection, but the clumps are easily carried over in the manner of Cannas by lifting them and storing in a box of sand or dry earth in a frost-proof cellar. The lifting may be much facilitated by planting in rough baskets made of poultry netting, as the meshes hold the soil well together, making the ball very easy to handle. The fleshy roots preserve their vitality well if not allowed to dry out too much. The best variety of the old type is generally sold as Tritoma uvaria grandiflora, and will grow under favorable conditions five or six feet high, with an immense flaming spike as startling as a sky rocket when seen unexpectedly, but it yields few blooms as compared with the variety illustrated The Kniphofias are very ornamental additions to our gardens from their glowing colors and pointed outlines, and it is a pity that they are not quite suitable to our climate. Of the various species we have tried K. Tuckii proved the hardiest, enduring several Winters without protection. The flower spikes were yellow and red, about six inches long, produced late in the season. A very dwarf variety sold as Corallina blooms quite freely for a long time, but is not as bright as Pfitzerii, which will grow from two to four feet high, according to local conditions. It may be had from dealers for 25 cents, and plants started in the Spring should bloom the same year, and increase greatly in strength by the next season.

GRAPE NOTES.—The hot and rainy Summer was hard on grapes in this vicinity. More mildew and rot was seen than for many seasons past. The showers were so numerous that fungicides, with the exception of powdered sulphur for leaf mildew, had little chance. The application of sulphur and Fungiroid in equal proportions from a dust gun was always followed by a perceptible lessening of the trouble. The black grapes under trial came through the adverse season better than the light-colored varieties, with the exception of Nectar or Black Delaware, which succumbed almost entirely to rot. Concord, Worden and Moore's Early all ripened fair crops in good condition. Campbell's Early and McPike perfected a few bunches on

ABNORMAL FLOWER DENUDED OF PETALS.
FIG. 321.

young vines. The former grew to large size, and developed a sweet and excellent flavor. McPike is the strongest grower, and has the best foliage of any variety yet tried. It ripens here at least two weeks after Campbell's Early, and resembles extra fine Concord, but is more juicy and has less acid pulp. We regard these new varieties as showing much promise under local conditions, and the development of the young vines will be watched with much interest. The difference in season of ripening is sufficient to make both desirable in the same planting. The largest crop from any one vine is 75 pounds borne on a five-year-old Isabella, planted in a favorable situation at the southwest corner of a dwelling, and trained on the south wall and a small trellis on the west. These grapes were well ripened and of good flavor by October 1. For a porch or trellis grape where an extended run can be had, nothing exceeds the Isabella in this latitude, though it is usually a failure if confined to close limits. Moore's Diamond produced the best "white" grapes, and from its dense bloom is better entitled to this designation than most of the green sorts. Niagara is reliable and an excellent cropper, but its quality is too low for a home grape. Salem ripened some good bunches, but was handicapped by mildew early in the Fall. Brighton is usually our best red grape, and seldom fails, but it does not amount to much this year. W. V. F.

SOME EFFECTS OF HYBRIDIZING THE ROSE.

In the season of 1892 Prof. Hansen and Prof. Budd made 1,300 crosses of the rose. The cross was made principally upon the Russian type of Rosa rugosa, which is said to vary slightly prove the ordinary type of Rosa rugosa. The best results of their work were obtained from plants upon which they used the pollen of General Jacqueminot. The results of their cross have proven very interesting, both from a botanical and horticultural standpoint. In the notes of the first season they record the fact that the hybrid seedlings grew more vigorously and taller than pure Rugosa seedlings, and that they showed the widest variation of foliage, some of them closely resembling the Rugosa in leaf, and others showing no rugosity of leaf.

Of the seedlings resulting from their cross 11 were thought to be worthy of preservation and naming, and are described in Bulletin 36 of the Iowa Experiment Station. We still have a number of these hybrids, and the illustrations, Figs. 320, 321 and 322, show the very peculiar effect that has been produced in some cases. The abnormal development of the sexual organs has been so great as entirely to destroy the value of the flower. In Fig. 320 is shown the abnormally developed receptacle pushing far up into the flower and the petals just enclosing it; Fig. 321 shows a flower from which the petals have fallen, uncovering the receptacle which, upon examination, shows the center broken up into many abortive flowers. Fig. 322 shows a most pronounced case of the attempt to break up into a compound flower. The little flowerlets all show their individual calyx and corolla and essential organs. To the practical horticulturist the flowers are useless, but as an illustration of the deformities that may result from hybridizing when a violent cross is made it stands as a striking example. H. C. PRICE.

Iowa Exp. Station.

TOMATOES IN TEXAS.—I am now shipping tomatoes from my Fall planting, set just as I began to ship early tomatoes, about May 25. This is a crop that stands our dry Summers almost as well as the cotton plant, and if planted on land that has never been cultivated it is as sure as cotton. I began shipping August 30, and will continue until frost, and if that does not come on me too suddenly will gather what I have, spread them out in some dry and well-protected place, and possibly ship for a

AN ATTEMPT TO FORM A COMPOUND FLOWER. FIG. 322.

month longer, or until about December 15. One of my neighbors shipped Christmas week last year. This crop requires very little work, and pays often over $100 per acre. They are netting at present about 65 cents per four-basket crate, which is two-fifths of a bushel.

Swan, Texas. C. F. P.

EMMER WHEAT.—During the past few years much has been said about "Speltz." Seedsmen have boomed the grain, and we have received many letters from readers who have been tempted to sow it quite largely. Farmer's Bulletin No. 29 describes this grain. It is an Emmer wheat—useful on the semi-arid regions of Nebraska, Dakota or farther west. It may also be useful in breeding new varieties of grain, but cannot be recommended for general cultivation.

Elgin

This is the word as it is written on the dial of the best watches made in the world. The works under the dial also bear the word "Elgin" and are all that ingenuity, science, art and skill can do to make a perfect timepiece. The Watch Word is Elgin the world around.

Sold by jewelers everywhere.

Easy Harness
All harness, old or new, is made pliable and easy—will look better and wear longer—by the use of
Eureka Harness Oil
The finest preservative for leather ever discovered. Saves many times its cost by improved appearances and in the cost of repairs. Sold everywhere in cans—all sizes.
Made by STANDARD OIL CO.

HOPE FARM NOTES

BEATING THE FROST.—In the race with Jack Frost, Hope Farm finally came out ahead. The corn was all cut in time. I am told that on the track, when they wish to crowd an extra second out of a trotting horse, they put a running horse in a sulky and run him hard behind the trotter as a pace-maker. In the race our boys made against frost Uncle Joseph acted as pace-maker!

Who is Uncle Joseph?

"Uncle" has a wide meaning at Hope Farm. The children have formed the habit of calling every man who comes close to the family "Uncle." "Mister" seems pretty cold to such warm-hearted little folks, and we do not believe that children should form the habit of calling grown people by their first names. Uncle Joseph has no connection with the Hope Farmers except that he reads THE R. N.-Y. and is a farmer. He came all the way from Oregon, where he had a little fruit farm. I tell the story of how he came to act as pace-maker in the race with Jack Frost because it shows how people all over this country are strung together on invisible threads.

THE MAN FROM OREGON.—He came into THE R. N.-Y. office one day to see some of the people who make the paper. He was on his way to his old home in England, which he left nearly 40 years ago. He went to Oregon 20 years ago, and took up some wild land which he had developed into a good fruit farm. This he had sold at a good figure, and so he was ready to go back and see the old country. The bank in New York found it necessary to send back to Oregon to verify a draft before paying him money, and so he had some idle days on his hands. A man along in years, without wife or children, who has worked hard all his life, soon gets tired of tramping about the great city. While sitting in the office he heard me say that corn cutting was rushing us, so he stepped right up and said that he would like to go and cut corn at Hope Farm while he was waiting for that money. The final result was that he came out, put on his old coat, and fairly shocked the corn by the way he went at it. He said he wanted to work for his board, but he kept at it so well that the Madame took me off one side and said:

"Tell him not to work so hard—board doesn't cost much!"

I fear the Madame wouldn't make much of a success as the boss of a gang. She doesn't realize that to a man like Uncle Joseph, who has worked all his life, fair labor through the honest working hours is far sweeter than play or idle ease. At any rate, take it from any view you will, he gave us a good lift with the corn, and we were glad to have him at the farm. I did not realize before how Hope Farm and THE R. N.-Y. can stretch hands far across the country.

GRAIN SEEDING.—We have over seven acres of wheat well seeded with grass, and expect to have about 10 acres of rye. We took our time putting in the wheat because we wanted it done as nearly right as possible. The ground was plowed well. When the soil was so wet that it bunched up in a ball when squeezed in the hand, we kept out of the field. The fertilizer was spread on the rough furrows, and then the Acme was run three or four times until the surface was mellow and smooth. The grain was then put on with a Cahoon seeder and worked in with the Acme—with the teeth out flat. Then the grass seed was put on and the job finished with the roller. . . . We used five pecks of wheat to the acre, with 10 quarts of Timothy and seven of Red-top. That is lighter seeding than Mr. Clark recommends, but it is enough for our soil, I think, when seeded with grain. I hope this is the last time we shall ever have to seed down these stony back fields. I intend to set trees in them on the Stringfellow plan, and if they succeed there will be an end to plowing and cultivating. . . . We hope to cover the corn and potato fields with rye. In the corn fields we scatter the rye on the ground and work it in with cultivator running both ways. This is no way to get an ideal stand of rye, but all we want is to cover the ground, prevent washing and have something growing next Spring which can be plowed under or left to mature—just as seems best. Had I done this last year I should have been at least $150 better off, as several acres stood idle through the season, while had they been seeded to rye in this way the straw and grain would now be for sale. . . . It must be understood that we are not sowing grain on the lower part of the farm, near the house. The fields I speak of are far over the hill—a long distance from the barn. I want these distant fields in crops which require no cultivation and few visits. We haul all our manure upon the few fields close to the barn, and there we expect to grow small fruit.

FARM NOTES.—Our ice gave out before September 1. I was afraid of it after the wet April and May. Looking back at it I think our mistakes were in not making the house perfectly tight at one side where it came close to the barn, and in neglecting proper ventilation at the top. . . . We have more trouble from crows in Fall than in Spring. By tarring the corn we prevent their pulling it, but in Fall after cutting they come to the shocks and get some grain.

Shoot them?

We haven't such a thing as a gun on the place. Why should we keep one? Those crows worked for us all through the season. My notion is that they averaged several times their live weight of insects. Now don't you think it would be rather small business after they have served us all Summer to turn in and kill them? . . . The cows broke out last week, and Julia and old Jersey filled up on apples. Happily we got at them in time. It's hard to kill Julia—these kickers die hard—but the old cow bloated until you could play the bass drum on her side. Three years ago an overdose of apples made her helplessly drunk, and brought great scandal upon me. This time we prevented that. She was fed cornmeal and given doses of cooking soda and a homeopathic remedy. . . Our late-planted corn made excellent fodder, but the grain is not a full yield. No use talking, it is impossible to obtain a full yield of grain unless the crop is planted by May 20 in our latitude. The month of June is the proper time for the baby plant to get out of its cradle and shed its long dress, and no later season can quite make up for the loss of June days.

SCHOOL NOTES.—We are doing our best on the farm to start the peach trees right. Hugh brags about the pure blood in the hogs, and Charlie believes that the colt will make Father Time take the dust. These things are all very well for the bread and butter side of life, but, inside the house, the Madame is training a crop which, after all, is worthiest to carry the Hope Farm brand. The little school is doing well. I am no hand to brag up our own little folks, for I know that few of their good qualities come from my side of the house, but I feel that we have four as pure and sweet little chunks of humanity as any family need call for. That they are so is due to the fact that the Madame has had them constantly under her control. Off here among the hills, on this farm, she is able to keep them from influences which corrupt and spoil many a child in town. It means hard work and a good deal of self-denial to conduct a home school, yet what better crop can one grow on the farm than boys and girls of strong and earnest character? Sometimes I look at my little Stringfellow peach trees and become nearly discouraged. They are still such little things, and have made such a slow growth above ground this year. It seems as though one could take one of these little stubs and pull it out with one hand. But try it! Take both hands, and grunt and strain, and the roots of your back will give before the tree will come. Why? Because these roots have gone down deep and firm into the soil. The growth this first season has been mostly below ground—where it ought to be. Stem, branch and bud will come all in good time. So it is with our little folks. I have no doubt that plenty of children from the public schools can "recite" all around them. That doesn't disturb me in the least. The Madame is their day teacher and their Sunday-school teacher, too. They are putting the roots of character down deep into the soil, and I hope they will never be pulled out.

HORSE FEED.—The following question is asked by a New York State man:

I am at present feeding my farm horses rye ground with bran. Is that a good ration? Compared with oats, four quarts per feed, how much rye and bran should I feed? I had about 650 pounds of rye ground with 500 pounds of bran. Would cow pea or common bean hay be good horse feed, that is a balanced ration? If not, how much grain should be fed?

A good deal of rye is fed in our section, but mostly to hogs and work horses. It will not take the place of oats for a driving horse. It is now pretty well known that oats contain a principle called "avenin," which gives spirit or "good feeling to a horse. My experience with rye is that it has a sluggish or constipating effect upon animals. For that reason bran would be a good grain to mix with it. I would mix the two grains half and half. This would make a good feed for horses that are at good steady work where no great speed is required.

Do we feed it?

No, for we think it pays us best to sell both the straw and grain of rye. We have been feeding a mixture of about equal parts of ground oats and corn and bran. Oats cost more than we can afford to pay, and we shall now feed ear corn and wheat bran.

As to cow-pea hay, I do not make any, nor do I advise northern farmers to expect hay from the crop. I would use it for green manuring or for pasture only. At the South there is better weather when the cow pea is ready for cutting and considerable hay is made there. I have heard of horses being well wintered on pea hay alone, but I did not find the small amount I made four years ago a full ration, and fed corn with it.

H. W. C.

Some Laws of Trees.

The Christian Endeavor World gives the following:

"In planting his orchard a farmer placed one row of trees close to the fence which divided his land from his neighbor's. While the trees were small they caused no trouble; but, when they grew large, the branches extended out over the neighbor's land and became a source of annoyance to him. One Fall, when the trees were loaded with fine fruit, the neighbor's boys commenced to take apples from the overhanging branches; and the wife of the owner of the orchard, being a hasty woman, scolded the boys and said some mean things about the neighbor's family. This started a very bitter quarrel. A few days after scolding the boys the woman crossed the division fence for a basket of apples, and was ordered out. Upon learning this her husband went to an attorney, and was told that, although the apples belonged to him, by crossing the fence to get them he made himself a trespasser; so the fine fruit fell off and rotted on the ground.

"The next Spring, the neighbor, while plowing under the overhanging branches of the apple trees, scratched one of his horses badly. This made him angry, and he sawed off all of the offending branches, straight above the fence. Then the owner of the trees again sought advice, but learned that he had no remedy. The trees looked very unsymmetrical, with the branches on one side all gone, but the neighbor had only exercised a legal right."

Unlawful Feed.

Prof. C. W. Woods, of the Maine Experiment Station, says that the law designed to prevent the sale of adulterated stock food works well. Formerly considerable adulterated cotton-seed meal was sold in the State but now a sample of this poor stuff is seldom seen. Not long ago a sample of this meal was sent for analysis. It had a bright color and was of good mechanical condition, but when analyzed it was found that some coloring matter had been mixed with it to conceal the ground hulls. The dealer was notified that this was the poorest sample of meal seen in the State for many months. This is what he had to say:

"The cotton-seed meal was sent to us by a New York party who wished us to handle the product of the mill. We requested, for the first thing we did, to send us the analysis of it, which they failed to do, but they still kept trying to make arrangements with us to handle their meal. We at last requested them to send us a large sample, which we immediately sent you for analysis, and now that we have found it so poor, we certainly shall not handle any of it, and shall make sure that none of our competitors does."

Prof. Woods says that this shows that the dealers are being educated so that they realize the difference in value of good and poor samples of feed, and this is largely the result of this law.

SATURDAY, OCTOBER 19, 1901.

ONE reason for printing the answers to the questions about the spring on the first page is the fact that they show what comes from studying our home resources. Suppose our friend had not examined the second spring, but had carried out his first plan of pumping water to the top of the hill. It would have meant a useless expense—money that should be used for some other purpose. It always pays to hunt out all the natural ways of doing a thing before we spend money for artificial methods.

*

THERE are dozens of good arguments in favor of a coöperative laundry. Mr. Frost gives some of them on page 707. Why, then, is it so hard to find such a laundry in actual operation? One reason is that it means a slight expense. The creamery means an income to the farm. The laundry takes work away from the wife or daughter, and means a cash payment. If it is to be established it must be done by the women folks. They will have to push it along. If these laundries were to save the labor of men rather than that of women there would be one in every neighborhood within a short time!

*

A PLAN is now on foot to attempt to raise the level of Moosehead Lake in Maine by two feet. By means of a series of dams and embankments the water of the lake may be piled up higher, so as to hold back a larger volume for use when the natural supply would run dry. This is becoming necessary, since greater use than ever before is being made of water power on the Maine rivers. It was once thought that steam had displaced the water power in New England, but with the coming of electricity these powers go into use again. Better develop the waters where people now live before going to "Arid America."

*

A FARMER of Chenango Co., N. Y., was on trial last week for selling "bob veal." His lawyer claimed that the law prohibiting the sale of such veal was repealed by the Legislature of 1901. The judge decided that in any event the case before him referred to a violation before the laws of 1901 were enacted. The farmer was found guilty and fined $25, with $25 more as costs. That made pretty expensive veal. There was never any intention on the part of the Legislature to repeal the "bob veal" law. Through a clerical error one section of the law was omitted, but those who feel inclined to ship the "bob" article will find it a very expensive business.

*

FROM the numerous trolley accidents which are reported it is evident that many who are employed as motormen are incompetent for this work. On lines running through country districts cars often make high speed—20 miles an hour is not unusual—and there are steep hills and sharp curves. No man is allowed to run a steam engine, either locomotive or stationary, without examination to test his knowledge of its construction and skill in handling it. Yet a trolley car containing 40 or 50 passengers is often put in charge of a man who has only a vague idea of what he is handling, and who gets his first points on hills and curves when the car runs away and upsets. Locomotive engineers go through a long schooling as firemen. They learn thus the momentum that a heavy train acquires at various rates of speed, and are able to run it safely around curves and down grades. A motorman certainly ought to have a fair knowledge of forces, speed and curves, as applied to his special work, and should have sufficient education and mechanical gumption to command twice as much salary as the man who collects the fares. Trolley companies would naturally object to being compelled to hire high-priced men, but we do not know any reason why they should be permitted to put the lives of passengers in danger, as is the case at present.

*

THE State of Mississippi owns and operates, with convict labor, the largest cotton plantation in the country. The object is to provide work for the convicts and raise money to defray State expenses. In other States convict labor is either leased or directly employed in manufacturing. Reports from Kansas indicate that that State will also enter into competition with farmers. A large creamery will be started at the Agricultural College, and the products are to be sold to help pay the expenses of the dairy school. While a single creamery or a single farm thus operated may not hurt the business of the private farmer, there is danger in any extension of this principle of public competition with private enterprise!

*

WE sometimes meet people who find fault because certain wealthy men are spending a good deal of money in buying and testing automobiles. There are two sides to this matter. The automobile is a new thing—with great possibilities both for country and town use. Before it can be put to a practical use in the country much time and money must be spent by some one in experimenting with different forms of power and different types of vehicles. This ought to be evident to all, for it is the history of most new and revolutionizing machinery. If the rich care to give their time and money to this work, we think it a good thing, even though they do it for their own pleasure. They will help make the automobile popular and profitable, and that will benefit all.

*

THE exhibit of apples made at the Pan-American Exposition by the Maine Pomological Society made a very effective display. The Society tried to show the commercial apples of Maine, and made no effort to collect abnormal specimens. This business-like exhibit showed all the color and beauty of the fruit from the Far West, with far superior flavor and keeping quality. Specimens of the crop of 1900 were in excellent condition—one barrel of last year's Baldwins opened September 18 showing 87 per cent perfect fruit! We have never been able to understand why the people of Maine are so modest about showing their magnificent apples. The display at Buffalo attracted much attention, but the Pomological Society ought to have had 50 times as much money as they did have for showing their fruit. As it was, there was nothing finer in Horticultural Hall.

*

THE Legislative Assembly of Victoria, Australia, is considering some sweeping amendments of a former law, concerning plants infected with insects or disease. Under these amendments no person may sell or expose for sale any tree, plant or vegetable in any way diseased, or affected by insect attacks. The law covers fungus, whether dead or alive, and insects, whether dead or in any stage of living existence. Inspectors are empowered to examine stock exposed in markets, and to advise the eradication of disease noted, but may not destroy the things condemned without higher authority. The Australian attitude towards diseases and insects affecting fruit and vegetables is similar to that of the Pacific coast. As an Oregon correspondent recently stated, these statutes do much to keep infected fruit out of the markets. They are certainly a great safeguard against carelessness in the orchard.

*

A READER of THE R. N.-Y. sends us the following clipping from a Syracuse paper. As printed the note had a big double head:

Cortland, Sept. 26.—Farmers in the village and town of Scott have become aroused over the great amount of intoxication among laborers in that vicinity, and as the men employed on the farms have not visited places where liquor is sold, the cause has been a mystery. One enterprising farmer has at last solved the mystery. At this season of the year the farmers are busily engaged in filling their silos, and in doing this the corn is cut up, saturated with water and packed in tight buildings erected for this purpose. This corn, uniting with the water, causes a fermentation, and the juice settles to the bottom of the silos. It appears that laborers engaged in filling the silos have found that this juice, after it has fermented, was good to drink. They accordingly bored holes in the sides of the silos, near the ground, and by attaching a spout to the hole drew out the juice into pails.

We have had experience with these "fake" stories, and know how they grow. Several years ago we had a cow that ate too many apples. The newspaper men solemnly stated that she gave a good quality of milk punch, and one man in Kentucky actually wrote offering any price for a calf from this cow in case the punch story was true! There is just about as much truth in this story of the silo juice. We doubt whether there is any more alcohol in silage than there is in new bread. There is not enough in it to enable any man to get drunk on the expressed juice. We know that men will sometimes crawl through very small holes, and pull their character after them, in order to gratify their thirst for intoxicating liquor. The silo is not a distillery or a brewery. It is far too useful ever to be saddled with such a reputation, even in sport. Is it not a shame that the papers will print such idle and foolish tales in their largest type, while a report of some worthy though humble effort to improve or dignify labor may go into the waste basket—or the smallest type in the office?

*

THE Hope Farm man said recently that he nearly starved to death while unlearning some of the things picked up at an agricultural college. Now a reader born with an interrogation point in his mouth wants to know what these things were! The most important one was the idea which some students get that just because they have finished a college course the world should rush and offer them a light job well ballasted with heavy pay. A college course gives many boys and men a bad case of what is well called the big head. Instead of rushing to load honors and cash upon the college graduate, the busy, practical world is inclined to distrust him, and will surely make him work for his place. Knowledge is power—but it is not machinery. It is more like a mighty waterfall—grand and inspiring, but of little real service to the world until it is harnessed so that its force may be applied to some useful machinery with a point to it. A man may obtain power and force from books or from spoken words. Others may fit and tighten the belt that connects that power, but the man himself must build and place the machinery that will enable him to bore into the world and fasten a handle there.

*

BREVITIES.

"Man's life means
Tender 'teens,
Teachable twenties,
Tireless thirties,
Fiery forties,
Forcible fifties,
Serious sixties,
Sacred seventies,
Aching eighties,
Shortening breath,
Death,
The sod,
GOD."

—Joseph Cook in Christian Endeavor World.

TURN your Oh, dears! into ideas!

THE bee uses a sweet-toothed comb.

A "SOFT SNAP" means a hard pull for somebody.

MAINE apple growers are enjoying a "boom" just now.

THERE are six Chinese voters registered in New York.

NO, sir! It is not likely that Corn smut will kill a cow.

WE have some chickens which we wish would act like bad debts—go home to rest!

A WESTERN man says that a horse's idea of Heaven is to be owned by a woman.

THE French are now said to be making a new butter substitute known as "vegetaline" from dried cocoanut.

IT is said that the Genesee River water is being stored so carefully that Rochester will be second only to Buffalo in water power.

"I DISLIKE the law as much as you do rum and tobacco," writes a Vermont reader. What would lawyers do if that idea were universal?

AMERICAN shingles are being ordered for South Africa. Dame Britannia has worn out several shingles over the Boers, and still they make faces at her.

THE ladybird beetle was brought to California to kill the destructive scale insects. It did the job well, but now a parasite has begun to kill the ladybirds.

CHINCH bugs did considerable damage in Maine last Summer. The experiment station recommends burning over infested places, spraying with kerosene or plowing.

IT is said that there are practically no pumpkins in western New York this year. The season has been bad for them, and they interfere with the work of the corn harvesters.

A GRAND ARMY post has "resolved" never to mention the name of the President's murderer. After one or two efforts to pronounce this name we think most people will make a similar resolve.

Gov. Odell has been asked to have the President's murderer buried at sea, so that not even his bones "may rest in American soil!" Better bury him and plant some useful tree by his grave!

AMATEUR photographers have a chance to get out their tools and see what interesting and attractive pictures they can make for the benefit of the women folks. Note the prize offer in the Woman and Home Department.

WE care little who first advised northern farmers to sow cow peas for green manuring. THE R. N.-Y. has tried to do its share of such advising. The more nitrogen traps we set in otherwise wasted fields the better.

WASPS have caused enormous damage to the English fruit crop, and it is advised that local horticultural shows offer prizes for wasp nests. This was done at a recent show in Essex, the boys of the district collecting a large number of the nests.

DURING the year 1900 no case of rabies was found in England or Scotland, and it is believed that the disease is entirely eradicated there. A stringent muzzling law exists, and no dog can be taken into the country without a satisfactory health certificate.

Events of the Week

DOMESTIC.—The first snow of the season for that section fell at Warsaw, Ind., October 3. This is the earliest fall there for 30 years. Two inches of snow fell in Miami Co., Ind., October 3. . . . . Fire in the Pittsburg Clay Pot Works, Allegheny, Pa., October 6, damaged the plant to the amount of $280,000. . . . . The native population of the Aleutian Islands is rapidly disappearing, the people succumbing to disease, measles being particularly virulent among them. . . . . A fire among warehouses at the north side of the Chicago River, on the lake shore, October 6, caused a loss of $90,000. . . . . The Amerlean Mission Board, supplemented by the Government authorities, has matured plans that insure the freedom of Miss Stone. Nearly $60,000 in cash and pledges for the ransom is in hand, and of this sum $35,000 has been transmitted to Constantinople by Kidder, Peabody & Co., through the State Department, where it has been placed in the hands of an agent for the brigands by the United States Consul. The extension of time for the full payment of the $110,000 demanded by the brigands will afford ample opportunity for carrying out the negotiations. The State Department is moving diplomatically in the case of Miss Stone, and, should it be proven that Bulgaria is implicated in the plot, a claim for damages will be made against her government. . . . . October 9 a boiler explosion at Erie, Pa., wrecked a brass foundry and a hotel annex; nine persons were injured, two fatally, and the property loss was $50,000. . . . . The State of Texas is starting prosecutions against fraudulent oil companies. More than 100 of that class sold millions of dollars of worthless stock during the early stages of the oil excitement. The suits will be tried at Austin.

ADMINISTRATION.—A new Isthmian Canal convention between the United States and Great Britain will be signed next month, at Washington. It will abrogate the Clayton-Bulwer treaty, declare the neutrality of the projected waterway, and concede the right of the United States to protect her own interests in time of war. . . . . Both parties to the Venezuela asphalt controversy have declined to enter into the arrangement for an amicable settlement, the foundation of which was laid by Minister Bowen, at Caracas, recently. . . . . School-book publishers have asked the Treasury Department for relief from the seizure of several thousand arithmetics by the Secret Service. These arithmetics were printed for use in the schools of the Philippines, and contained pictures of American coins. As any printed fac simile of an American obligation is in violation of the counterfeiting laws, the arithmetic was suppressed The publishers contend that a wrong has been done, as the pictures were educational to the Filipinos and necessary to the information of the children in the schools. The question will be taken up by Secretary Gage on his return to Washington.

PHILIPPINES.—Steamship advices say the Island of Panay, which has been affected by the plague, is now suffering from famine. One hundred and thirty deaths from starvation are reported to have occurred at Capiz alone. . . . . To prevent the spread of plague, Manila has inaugurated a war against rats, and is paying 2½ cents for each rodent delivered to the board of health. . . . . Major Morris C. Foote, of the Ninth Regiment, who was in Balangiga the day before the disaster at that place, says Captain Connell had been fully warned, and had taken what he (Major Foote) considered every necessary precaution. Major Foote had heard from a priest that the natives meant to attack the garrisons at both Balangiga and Basey and that the Basey garrison was to be attacked from a cock-pit behind the barracks. Orders were immediately given to demolish the cock-pit, and extra guards were stationed. He cannot understand how 48 Americans were killed at breakfast. . . . . General Smith sailed from Manila October 9 for the relief of the Island of Samar. He will take command of Samar and Leyte so as to enable General Hughes to devote himself to the Island of Cebu, where trouble is possible unless strong measures are adopted.

GENERAL FOREIGN NEWS.—A violent gale prevailed over northwestern Europe and Great Britain October 6-7. A cyclone and waterspout were reported in the English Channel, and much damage was done to shipping. . . . . The Ameer of Afghanistan died October 7. He was educated and progressive, and a strong ally of Great Britain. . . . . The Russian government has barred American miners out of Siberia; they will not be allowed to take up claims or to work for wages. Next Spring the treasury department of the Russian government will patrol the Siberian coast with revenue steamers, whose duty it will be to see that no trading is done with the natives except by persons acting under permits from the Russian government.

FARM AND GARDEN.—The Illinois State Horticultural Society will meet at Champaign, December 10-12. A fine display of fruits and vegetables is expected, liberal premiums being offered, and an excellent programme, including many well-known speakers, is assured. Secretary, L. R. Bryant, Princeton, Ill.
